When using the Apple 8/24 GC card I have noticed that circles sometimes do not show up or that the circle goes around all the way or 180 degree circles are inverted. What can I do to fix this?

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.
This will happen when the 8/24 GC card is accelerated. This will not occur when the 8/24 GC accelerator is turned off.

Background - We did not run into this when testing a pre-release version of the 8/24 GC card during the testing period prior to the release of Claris CAD 2.0v1. A change was made to the GC card before the release of the card, but after Claris CAD 2.0v1 was released. Make sure that you have the current version of the card and its software.

Claris CAD 2.0: Bombs with ID = 28

When changing the tolerance values in the Dimensions floater, I crash with an ID = 28. What can I do?

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.
This happens on the Macintosh Plus or SE when changing one of the tolerances. If you double click on the second tolerance, it will cause a bomb. If you tab from one tolerance to another this crash will not occur.

This has been fixed in Claris CAD 2.0v2.
Published Date: Feb 18, 2012

ClarisWorks: Standard Deviation of a "Sample"

How to determine the Standard Deviation using ClarisWorks, and its difference from FileMaker.

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.

FileMaker Pro and FileMaker II provide a StDev function that allows you to calculate the standard deviation of an entire population represented by values in a repeating field. There is also a summary field option to calculate this result over a range of records. You cannot use these built-in functions, however, if you need to calculate the standard deviation of a sample. Certain professions require that the standard deviation of a sample be used, rather than the standard deviation of a population. To find the correct deviation of a sample, you must calculate the value the "long" way:

Suppose you want to find the sample standard deviation given Measurements, a repeating field containing the values 90, 85, 87, 50, 92, 95, and 100.

1. Define a new calculation field, D, with the same number of repetitions as Measurements, and a number result. Use the formula:

```
( Measurements - Average ( Measurements) ) ^ 2
```

2. Define another calculation field, StDev.sample, with a Number result. Use the formula:

```
( Sum ( D ) / (Count ( Measurements ) -1) ) ^ .5
```

The result of StDev.sample will be 16.46.

And, to further complicate matters:

FileMaker Pro and ClarisWorks give two different results for Standard Deviation. This is because FileMaker Pro uses the formula for Standard Deviation based upon a population, and ClarisWorks uses the formula for Standard Deviation based upon a sample.

To determine the variance (based upon population) of a group of numbers, perform the following steps:

1) find the average (mean) of a group of numbers. That is, add up all the values of the numbers and divide by the number of entries.

For the series of numbers 115, 121, 130, and 156, the mean is:

```
(115 + 121 + 130 + 156) / 4
(522) / 4
130.5
```

2) subtract the mean from each of the entries to yield the deviations;

```
115          15.5
121          9.5
130          0.5
156          -25.5
```

3) square the deviations

```
115          15.5          240.25
121          9.5          90.25
130          0.5          0.25
156          25.5          650.25
```

4) add the square of the deviations

```
240.25 + 90.25 + 0.25 + 650.25 = 981
```

5) divide the sum of the deviations squared by the number of entries yields the variance.

```
981 / 4 = 245.25
```

6) the square root of the variance is the standard deviation

```
245.25 ^ 0.5 = 15.6604597633658
```

The result from step 6 is the same as FileMaker Pro using either StDev() function within a calculation field Standard Deviation within a summary field, whichever is applicable.

To obtain the standard deviation based upon a sample, change step 5 to:

5) divide the sum of the deviations squared by the number of entries minus one. That is:
981 / (4 - 1)
981 / 3
327

The same formula for step 6 is used. That is, take the square root of the variance.
327 ^ .5 = 18.0831413200251244

The results in steps 5 and 6 correspond to the VAR() and STDEV() functions, respectively, using ClarisWorks.

Claris CAD: Low Memory Alerts on Macintosh SE, Classic, Plus

Working with Claris CAD 1.0 on Macintosh SE's and Pluses that have 1 MB of RAM is a tight squeeze.

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.
In order to free up memory to run Claris CAD :

- Create a new folder called "Storage".
- Open your existing System Folder.
- Choose "by Kind" from the View menu. This will organize all the files by the type of file they are.
- Place all "Startup documents" and "Control Panel documents" in the "Storage" folder.
- Restart the computer.
- Launch Claris CAD.

If this works, return any control panel and startup documents to the system folder, in order of importance. Restart the computer each time you return documents to the System Folder, then test to insure Claris CAD will run.

One other thing you may wish to look at is the number of fonts and desk accessories present in the System File. Each font or desk accessory uses additional memory.

Claris CAD 2.0 or later requires 2 megabytes of RAM under system 6, and 4 megabytes under System 7.

Claris CAD 2.0v2: Incompatible with FileMaker Pro EPSF Filter

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.

When you use both Claris CAD 2.0 and FileMaker Pro 1.0v2 on the same system, the EPSF XTND filter will be displayed in the the Open, Save As or Place File windows in both applications. Although Claris CAD 2.0v3 recognizes the EPSF XTND filter from FileMakerÊPro, and your EPSF file names will be listed in the Claris CAD Open dialog box, this filter is not compatible with Claris CAD 2.0v2. Since there is no way for Claris CAD to ignore this filter, we recommend that you do not select the FileMaker Pro EPSF filter while in CAD 2.0v2.

Claris CAD 2.0v3, under System 7, is compatible with the EPSF file that shipped with MacDraw Pro.

Claris CAD 2.0: Exporting (Using CGT) to IGES/DXF

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
Note: CGT 1.1 will translate Claris CAD 2.0 files directly. This article only applies to users who have not recieved the 1.1 update and are still using CGT 1.0.

To export a file created in Claris CAD 2.0 to IGES or DXF format using Claris Graphics Translator (CGT) 1.0 follow the steps below.

1. Open the Claris CAD 2.0 drawing and choose Save As from the File menu.
2. In the Save As dialog box, choose MacDraw II 1.1 from Save As pop-up menu.
3. Open the MacDraw II 1.1 file in CGT 1.0 and then transfer to IGES or DXF as usual.

You do not need to save files in MacDraw II 1.1 format when importing into Claris CAD 2.0. Claris CAD 2.0 reads Claris CAD 1.0 files directly.

This information can also be found on the last page of the Claris CAD 2.0 release notes.

Claris CAD 2.0: Hardware Certified/Verified to Work (Compatibility List)

The following hardware has been certified to be fully functional using Claris CAD version 2.0

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.

1. Monitors
- Apple 480 x 640 monochrome monitor
- Apple 480 x 640 color monitor
- Apple Full Page Display monochrome monitor
- Radius Full-Page monitor
- Radius Two-Page monitor
- SuperMac 19-inch Color Monitor

2. Video Cards
- Apple Full Page Display Card
- Apple Macintosh II Video Card
- Apple Display Card 8*24
- RasterOps 232 Graphic Card

3. Printers and Plotters

Printers:
- Apple LaserWriter/LaserWriter Plus
- Apple LaserWriter II NT/NTX
- Apple LaserWriter IISC
- Apple ImageWriter I/II (AppleTalk and Direct Connect)
- Apple ImageWriter LQ (AppleTalk and Direct Connect)
- Hewlett-Packard DeskWriter (AppleTalk and Direct Connect)

Plotters
- Hewlett-Packard:

7440A, 7475A, 7550A, 7580B, 7585B, 7586B, 7595A, 7596A
- Houston Instruments

DMP series: 29, 40,41, 42, 51, 51MP, 52, 52MP, 56A, 56A MP, PC 595A, PC 695A

4. Input Devices
- Apple Standard Mouse
- Apple Standard Keyboard
- Apple Extended Keyboard
- German, French and Swedish Keyboards

Although they have not been certified with Claris CAD 2.0, the following hardware items have been tested for basic functionality with Claris CAD, and seem to work fine with the program:

1. CPU's/Cards
- Radius SE 16 Mhz 68020 Accelerator Card
- Apple Mac LC - prototype model available during development

The product does not run on a Macintosh 512KE or earlier.

2. Disk drives
- HD20SC, 80SC external hard drive
- PLI removable cartridge hard disk drive
- Jasmine 20 Mb external hard drive

3. Monitors
- Radius 24 bit color monitor
- Radius Swivel Monitor prototype model available during development

4. Video cards
- Apple 8*24 GC card - prototype model available during development
- Micron Technologies Xceed Cache Card

- SuperMac 24-bit color card
- SuperMac QuickDraw Accelerator card

5. Printers
- QMS ColorScript 100

- QMS ColorScript 100, model 10
- Tektronix 4693DX
- Tektronix ColorQuick
- GCC Personal Laser Printer
- QUME printer
- Hewlett-Packard DeskJet

6. Input Devices
- Turbo Mouse
- Apple Extended Keyboard II
- Kurta 8.5-inch by 11-inch (ADB) tablet
- Summagraphics Bit Pad Plus (ADB)
- CalComp WIZ

MacDraw II: Top Of Page Not Printing To Personal LaserWriter

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.

When printing from MacDraw II (all versions), if Larger Print Area is enabled in the Page Setup Options dialog box, the top 1/8" or so won't print. The only workaround is to disable Larger Print Area, or to print to a different printer, such as the LaserWriter IINT/NTX.

MacDraw II gets its information about the printable area from the LaserWriter driver. However, not all printers can print to the maximum printable area that's defined in the print driver.

Published Date: Feb 18, 2012

Claris CAD: Missing Or Distorted Objects When Printing To LaserWriter

I am printing to a LaserWriter. Some of the objects in my drawing print distorted (circles print as ellipses) or are entirely missing (arcs, lines etc.). What is going on?

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.
This is corrected in 2.0v3

Print Monitor and Background Printing

Some Claris CAD 2.0v1 and 2.0v2 will not print all the objects present in the document. There are specific conditions in Claris CAD that appear to be causing the difficulty.

To print correctly:

- The simplest way to avoid the issue is to insure that all floaters are closed. A floater that is open or collapsed will cause the difficulty.

- PrintMonitor can run out of memory in processing drawings, especially large drawings. To test whether this is the issue, turn off background printing in the chooser and attempt printing the drawing again. If this works, increase the memory allocated to Print Monitor.

Other Spoolers
This same phenomenon can also occur with spoolers like SuperSpool , SuperLaser Spool or TOPS spool. To test if this is the case, attempt printing without the spooler. If it works, allocate more memory to the spooler.
Published Date: Feb 18, 2012

Claris CAD 1.0: Arcs Adding Loops or Extensions

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
Claris CAD 1.0 had an anomaly where arcs smaller than one degree would often have a loop, tail or curly extension. To see this, create an arc with a large radius (10") and very small visible segment (around 1 degree). Zoom in on the arc--you will see a looped extension.

In Claris CAD 2.0 this is basically fixed. However arcs, after they have been modified by being moved, duplicated, flipped can often have extensions to them. This is caused by some random information being added by the modification to the decimal portion of arc. There is a way to delete the random information and correct the display.

- Select the arc.
- Show Info
- Highlight the decimal portion of the Radius of the arc and delete it and press Enter. (e.g. if the radius is 53.425, delete .425)
- Retype decimal portion press Enter (e.g. type .425).

(You should not cut and paste the decimal portion because doing so will not remove the random information present in the internal information about the arc.)

Claris CAD: Scaling Text Block Of Mixed Sizes

Scaling a text block of mixed sizes scales all text to one size.

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.
The following steps recreate the behavior:

Create the text block "Testing font sizes".
Make the word "testing" 24 point.
Make the words "font sizes" 12 point.
Scale the text block 50%.

The entire block becomes 12 point, when only the first portion should be 12 point.
The second portion should be 6 point.

This is specific to text blocks whose first run of text is 24 point. Text blocks scale correctly if the first run of text is other than 24 point.

Claris CAD 2.0: Object Missing From Printouts

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
Some Claris CAD 2.0 files will not print all the objects present in the document. The customers reporting these problems are using Background printing to a LaserWriter.

There are specific conditions in Claris CAD that appear to be causing the behavior.

To print correctly:

- The simplest way to avoid the issue is to insure that all palettes are closed. A palette that is open or collapsed will cause the problem.
- A second way to avoid the issue is to turn off background printing. This generally is the only solution if the document contains bitmaps or scanned images.

This is corrected in Claris CAD 2.0v3.
Published Date: Feb 18, 2012

Claris Software: Incorrect Fonts Print in EPS Graphic

This article explains why your EPSF image sometimes prints the text in a font other than the one you originally intended.

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.

Situation:
An EPSF image contains text that prints as Courier instead of the actual font.

Explanation:
The EPSF image uses a font that is not built-in to your printer. Some applications (like Quark XPress) scan the EPSF image before printing and automatically download (send the font from your computer to the printer) the fonts that are not resident in the printer, but Claris applications don't. They just send the Postscript code from the EPSF graphic to the printer. Thus, when the printer attempts to print the font that hasn't been downloaded, the printer will substitute Courier. FileMaker Pro 2.0v4 and later and MacDraw Pro 1.5v2 and later may help alleviate the situation.

Workaround:
In your drawing, type one or two characters in a text object using the same fonts used in the EPSF image. Be sure to use the exact same font, not just a font from the same font family (e.g., if the EPSF image uses Goudy Italic, use Goudy Italic in the text object, not Goudy Plain). Then, with the text object selected, choose Send to Back in the Arrange menu. To make this text object not print, place it behind the EPSF image or another object, or draw a rectangle (white fill and pen) over the text object to mask it.

When printed, the text object will be sent to the printer, causing the font to be downloaded. Then, when the EPSF image is sent to the printer, the font will already be resident in the printer. Thus, the text in the EPSF will print correctly.

This workaround sometimes fails when you have several download fonts in your document, or if the graphic is complex. The printer will receive the font information, but may discard the font if it needs the RAM to process the image. If this happens, try enabling the "Unlimited Downloadable Fonts..." option in Page Setup/Options. Alternatively, you can download the font in advance using the Font Downloader program, which is included with Adobe fonts.

Alternately, you can use the "Convert to Outline" command in Adobe Illustrator 3.0. Alter the EPSF image with the Convert to Outline command, then reimport the EPSF image into FileMaker Pro. This command will convert text elements of your illustration into graphic outlines. Once this is done, you'll have no need to worry about fonts. (The image will print faster, too.)

Exceptions (FileMaker Pro).
Although this behavior was - for the most part - fixed with FileMaker Pro 2.0v3, there are exceptions if the EPS file was saved from either QuarkXPress 3.11 or Adobe Illustrator 3.2.

Tests have been made by Claris Technical Support which confirm that an EPS graphic saved out of either QuarkXPress 3.11 or Adobe Illustrator 3.2 and then imported into a FileMaker Pro 2.1v1 layout does not download the correct fonts to the printer. Instead, any text embedded into the EPS graphic which use fonts that are not resident in the printer will print using Courier.

The solution for this is to include a text block on the layout which uses the same font of the text in the EPS. Since this new text block must be downloaded to the printer first, place it at the "back" of the layout using the "Send To Back" menu item under the "Arrange" menu. Also, as mentioned earlier, since this new text block should not actually show up on the printed page, either set its color to white using the "Text Color" menu item under the "Format" menu, or position it behind the EPS image, or mask it.

Note: tests indicate EPS graphics saved from MacDraw Pro 1.5v1 and imported into FileMaker Pro print correctly.
Text in EPSF Image Prints Using Courier

MacDraw II: Printing Handouts To A DeskWriter

Printing Slide Handouts (2 or more) on an HP DeskWriter will not print the bottom of each slide. The bottom of each slide is missing on the printout. It is worse when printing two slides per page than when printing three or six per page.

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.
This behavior exists with all current versions of MacDraw II (1.1v2) and DeskWriter software (2.1)

There is no workaround, other than to print one slide per page, then reduce them on a photocopier.
Published Date: Feb 18, 2012

MacDraw II, Claris CAD: Closepath Error Using LaserWriter Driver 6.0x

When printing some MacDraw II documents to a Postscript printer, you may get an error message that says: "Offending command: closepath." This is a message from Postscript. This usually occurs in drawings with polygons that have many vertices while using LaserWriter driver version 6.0x.

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.
The best workaround is to print using LaserWriter driver 5.2. There are some differences between versions of the LaserWriter drivers in the way polygons are converted to Postscript. This is not a common issue. Most MacDraw II documents print fine using 6.0x.

Claris CAD 2.0: Finding the Distance Between Two Points

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
In Claris CAD 2.0, you can find the distance between two points by using the arrow cursor and the L box in the Location bar.

The point resize icon (between the zoom percent indicator and the X box of the location bar) must be set to resize from the point clicked. The diagonal line should not be through the box.

Let's say that you wanted to find the distance between the endpoints of two lines.

1) Select and lock the endpoint modifier
2) Click on the first endpoint and release the mouse
3) Drag the mouse (with the button up) to the second line's endpoint, so that the cursor indicates that it has selected the line. Do not click the mouse.
4) The L box in the Location bar will indicate the distance between the two points.

If you click on the second point, it will select that point as the last point clicked and the L box will show you how far the cursor is from that point.

The whole idea is that the L box will show you the distance from the last point clicked to the point where the cursor is or where a modifier is selecting a point.

MacDraw, MacDraw II: Objects Shift When Pasted/Imported To Other Programs

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
Objects drawn in MacDraw II or MacDraw Pro, then brought into other applications, may shift apart slightly. Also, smoothed polygons and freehands may become distorted. This can happen if the objects are brought in via the clipboard, or imported from a PICT file. This happens because the PICT format (which includes the clipboard), rounds the horizontal and vertical placement of the data points that define each object to the nearest 1/72 of an inch.

What to do to reduce this

(MacDraw Pro only) This can be avoided by saving as an EPSF file, then importing the EPSF file into the document in the other application. Use this approach when printing to a Postscript printer.

If using a QuickDraw printer and/or MacDraw II, try the following seven steps:

1) Open the drawing in MacDraw II or MacDraw Pro:
2) Make sure all objects are ungrouped.
3) Turn the Autogrid ON (the menu item should read "Turn Autogrid Off"
4) Go to Rulers, set it to 1 inch = 1 inch, 36 or 72 divisions per inch. Click OK
5) Select All objects
6) In Alignment, choose Align to Grid, Align Left and Align Top
7) Re-copy and Paste into the other application

These steps may reduce the behavior with an existing file. However, it may not be eliminated entirely, as this will not align all the objects' data points to the grid, just the upper left corner. Instead, you'll get better results if you do steps 3 and 4 BEFORE drawing the objects.

MacDraw II: CorelDraw & PICT Format

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
CorelDraw (an MS-DOS drawing program) can save files as PICT files. However, if you transfer the PICT file to a Macintosh, MacDraw can't open the file.

This is because the PICT file does not have a file type. PC files do not have file types/creators and are unable to assign these attributes to a file. After the file is transferred to a Macintosh, you must use a program that can edit the file type. (These include ResEdit, DiskTop, and MacTools). The file type should be changed to PICT (all caps). The file will then be openable by MacDraw by using the Open command in the file menu.

MacDraw, MacDraw II: No Out Of Paper Message From DeskWriter

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.

In MacDraw II and MacDraw Pro, when there is no paper in the paper tray of a DeskWriter, you do not get a "no paper in tray" message. It seems to be the driver that does not send the message.

MacDraw Pro: Colors are Incorrect In Imported Image

When video is set to 256 colors (8-bit) or less, the colors in an imported PICT or TIFF may appear incorrect. Imported color PICT and TIFF images may contain many colors that do not exist in the Claris Colors palette (or whatever palette you're using).

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.
Set the monitor to display thousands or millions of colors, OR

1. Select the imported image.
2. Tear off the color palette.
3. From the Special menu in the color palette, select Image Colors.

The colors in the imported image will now be correct. However, colors of other objects may now be incorrect. To correct this, copy and paste all the colors of the new color palette into the Claris colors palette or whatever other palette you're using. (In the palette menus, choose Select All, then choose Copy, then choose Claris Colors, then choose Paste.) If the pasted colors appear dithered, select them, then select the Solid command from the palette's Special menu.

Explanation: MacDraw Pro is preset to use the Claris Colors palette, which is a collection of 168 predefined colors. Eleven other colors exist as colors in the Style Bar and as reserved colors, for a total of 177 colors. If your monitor is set to display 256 or fewer colors, it may not be able to display all the colors in the current palette, the Style Bar and the imported PICT/TIFF image.

If the number of colors in a single palette exceeds the number of colors that your monitor is set to display, the extra colors will be displayed as dithered patterns, simulating the extra colors. If your monitor is set to thousands or millions of colors, you can correctly display all the colors in the document without having to place all the colors in a single palette.

MacDraw Pro: Library Window Obscured By Document Window

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.

In MacDraw Pro, if the library window is completely covered by the document window, you can bring the library window forward by typing Command-Shift-W. There is no pull-down menu command to do this.

This is similar to the way MacDraw II functions.

Applesoft Firmware Card: Options

The Applesoft firmware card was designed to supply floating point BASIC to Apple II owners. There are two options on the card that the user may select.

This article has been archived and is no longer updated by Apple.

1. Most obviously, the position of the switch on the rear of the card is used immediately after a system reset to force the selection of one of two banks of ROMs: the firmware card or the motherboard. If the switch is up then the system will default to Applesoft, otherwise the system will default to Integer BASIC.

2. Software, by accessing address $C080, can select Integer BASIC, or, by accessing address $C081, Applesoft.

Unfortunately for systems with Auto Start ROM, every time DOS gets control immediately after a reset, DOS forces a load of the version of BASIC DOS last used, regardless of the position of the switch.

TA41485_AppleShare_File_Server_and_Viruses_Continued_(TIL05440).pdf

AppleShare File Server and Viruses, Continued

Since an AppleShare file server can be infected with WDEF, can the existence of WDEF on the server affect its performance? Also, since the server uses a different format of the Desktop file, which file gets infected?

This article has been archived and is no longer updated by Apple.
The WDEF virus causes a significant performance lag on the file server during the time the Desktop file on the server is being written to. After the initial infection, there won't be a performance problem.

The file called "Desktop" is the file that is infected. Remember, this is the file at the root level of the volume. The "Desktop DF" and "Desktop DB" files created by the Desktop Manager INIT are in the Server Folder, and are not bothered by the WDEF virus for two reasons:

1) The Server Folder is not accessible by any program on a workstation.

2) WDEF looks for a file called "Desktop" to infect, not "Desktop DF" or "Desktop DB".

MacDraw Pro: Slower When Colors Set To "Thousands"

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
MacDraw Pro may be significantly slower in operation when the number of colors is set to "thousands" (16 bit) instead of "millions" (24/32 bit) or other video modes. This is because the computer is faster (more efficient) in accessing the memory on the video card at some monitor settings (bit depths) than at others; it is not due to MacDraw Pro. In general, any video card may operate faster in some video modes than in others.

This slower operation will include selecting objects, selecting tools, zooming and scrolling. If the speed is objectionable, the best solution is to use a different video mode. Going to a video mode with more colors, however, may require making more memory available to MacDraw Pro.

You can check the current video mode by selecting About MacDraw Pro from the Apple menu. It will show you the available colors for MacDraw Pro. If this number is followed by " * Currently limited by memory ", MacDraw Pro (1.0 only) is operating with fewer colors than is set in the Control Panel. MacDraw Pro 1.0 may actually switch itself from 24/32-bit mode to 16-bit mode if necessary when you enlarge a window or change the Monitors settings in the Control Panel while a document is open.

Note: MacDraw Pro 1.5 does not switch monitor bit depth to free up memory as MacDraw Pro 1.0v1 does. Instead, MacDraw Pro switches the offscreen buffer off (drawing directly to the screen/video memory).
Published Date: Feb 18, 2012

MacDraw Pro: Memory Limitations and Colors

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.

Certain actions, such as enlarging a document window or increasing the number of colors in the Control Panel while a MacDraw Pro document is open, can cause MacDraw Pro to need more memory than is available to it. When this happens, MacDraw Pro 1.0 will display the following warning message: "Warning! Different colors or patterns may appear in some windows because of memory limitations." MacDraw Pro will automatically switch to a video mode with fewer colors to compensate for the shortage of memory on the application and allow for the desired operations to be performed. This is a feature, since the alternative would be to not allow the change in window size or video mode at all.

The changed video mode is not indicated in the Monitors Control Panel. You can see the current video mode by selecting "About MacDraw Pro" from the Apple menu. The line "Available colors: xx*" will be followed by an asterisk. Below that, you will see: "* Currently limited by memory."

MacDraw Pro will drop to the next lowest video mode. If that is insufficient, it will drop even further if necessary. The lower video mode that MacDraw Pro selects may be a video mode that is not selectable by the Monitors CDEV. For example, it may drop from "millions" of colors (24/32 bit) to "thousands" of colors (16 bit), even though "thousands" may not be an option in the Monitors Control Panel. This can happen, for example, with the Apple Macintosh Display Card 8*24.

To use all the colors that are selected in the Monitors Control Panel, make more memory available to MacDraw Pro.

Note: The video mode will not affect printing. Also, this information applies to version 1.0 only. MacDraw Pro 1.5 does not change the bit depth of the video to free up RAM. Instead, MacDraw Pro disables the offscreen buffer (drawing directly to screen/video RAM).

MacDraw Pro: RAM Requirements Affected By Window Size

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
In MacDraw II, the RAM required to load a file into RAM is dependent on (among other things) the screen size. In MacDraw Pro, the RAM required is dependent on the size of the document window and the screen resolution. In other words, if you make the document window smaller, you'll need less RAM to operate the file. This can be useful if you're running low on memory, because you can make more memory available by shrinking the document window(s).

To see the effect of window size, try the following steps.
1) Open a blank file in MacDraw Pro
2) Select About MacDraw Pro from the Apple menu. Notice the amount of RAM used by the blank file. Close the About box.
3) Shrink the window of the blank document.
4) Select About MacDraw Pro from the Apple menu again. Notice the amount of RAM used by the blank file is less.

TIP: If you're trying to open a document with the Open command, but are getting "not enough memory" messages, try this:

1- Open a new blank document.
2- Shrink the window size to the minimum.

3- Use the Place File command to place the file you want into the blank document.

When a file is opened with the Open command, MacDraw Pro attempts to open the file in full-screen window (this includes all translated files). Using the Place File command to place the image into a small document window requires less memory. Remember, though, that the Place File command only places the objects from the file; it does not bring with it the layers, palettes, or menu settings of the placed file.

MacDraw Pro: Slow DeskWriter / LaserWriter IISC Printing of Gradients

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
Printing gradients to a DeskWriter, LaserWriter IISC or StyleWriter from MacDraw Pro 1.0 is extremely slow. In fact, it may take several hours to print a document with gradients. The computer will display the standard dialog box that says "Now printing page x" and will appear to be inoperable. If you wait long enough, however, the document will probably print.

The following will significantly improve printing speed:
1- Upgrade MacDraw Pro to version 1.5
2- Upgrade the DeskWriter driver to 3.0 or later

In addition, the quality of the gradients may be very low (8-12 gradient steps). This is a function of the print driver, not due to MacDraw Pro. To print better gradients, use a print driver that supports grayscale. This includes:

DeskWriter - 3.0 driver
DeskWriter C, 550C - any version
LaserWriter IISC, Personal LaserWriter SC - WonderPrint Utility
StyleWriter - use StyleWriter II driver or WonderPrint utility

Claris CAD 2.0: Too Much Constraint or Snapping of Objects

Sometimes an object placed at one location may unexpectedly snap to another. This unexpected movement is most noticeable when zoomed in and the grid points are not all visible on the screen or when the object snaps to a point off the screen.

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.

There is a hierarchy that determines where an object will snap as it is created or moved. At the top of this hierarchy is the modifier that is chosen followed by the Dynamic Modifier, Guideliner, Autogrid, and Caps Lock key. These features exist to help you with precision drawing. To reduce the amount of automatic constraining or snapping of objects, first make sure you are using the correct modifier. Then turn off the Dynamic Modifier, Guideliner, Autogrid, or release the Caps Lock key. Please note that the Caps Lock key is last in the hierarchy. It cannot override those items ahead of it in the hierarchy.

MacDraw Pro: 32-bit QuickDraw Required on SE/30

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
MacDraw Pro requires that the 32-bit QuickDraw INIT be installed in the System Folder when running on an SE/30 with System 6.0.8 or earlier. This is because the SE/30 has color ROMS. MacDraw Pro requires the 32-bit QuickDraw INIT on all machines with color ROMS, whether or not there is a color screen attached.

The 32-bit QuickDraw INIT is on the Printing Tools disk, which is one of the System Software Disks.

To install:
1 - Copy the 32-bit QuickDraw INIT from the Printing Tools disk into the System Folder on your hard disk.
2- Restart the computer.

The 32-bit QuickDraw INIT contains programming code which fixes issues with some code in the ROMS related to color. MacDraw Pro uses this code in 32-bit QuickDraw to operate reliably on color Macintosh computers.

MacDraw Pro: Can‘t Select Image Colors for an EPSF Object

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
When an EPSF object is selected, you can't select the Image Colors command from the Special menu in the Color Palette.

MacDraw Pro cannot extract the colors from an EPSF image. However, you can use the eyedropper tool to pick up colors from the PICT Preview part of the image.

The colors that you see are from the PICT preview portion of the EPSF object. These PICT colors are merely approximations of the actual colors, which are in the Postscript part of the EPSF object. Even if Image Colors were selectable for EPSF objects, the extracted colors would be of little use since they are not the exact colors used for printing.
Published Date: Feb 18, 2012

MacDraw Pro: Hidden Preferences

In MacDraw Pro 1.0v1 and 1.5, there is an undocumented category available in Preferences called Hidden. This category is available only by holding down the Option key while selecting Preferences. As it is a hidden feature, it is not officially supported by Claris.

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.
There are three options in Hidden preferences:
1- Key Shortcuts
Key shortcuts allow you to display Command-key shortcuts within several dialog boxes. The default setting is ON. Turning this off means that the Command - key shortcuts don't display in the dialog boxes when the command key is pressed. There is little end - user benefit to this. This option exists so that our writers can take screen shots of these dialog boxes without displaying the Command - keys.

2- Use even-odd clipping
This feature allows you to work with polygon objects where the polygon keeps any overlapping points area empty or unfilled. i.e., if you draw a filled polygon in the shape of a star, the center of the start will be left unfilled when you print it out. This was implemented specifically for Associated Press who needed to have this feature.

3- Enable Screen Only Options
When enabled, three features are available:
a) You can apply both a fill pattern and a gradient to an object. This is a screen-only option because objects filled with both a gradient and a fill pattern may not always print properly. Improper printing occurs more often with rotated objects. As a screen-only option, it can be used for screen display, slide shows, etc. If you need to print rotated objects with both a pattern and a gradient, save the file as an EPSF file. The EPSF object should print correctly.

b) You can make the background color in a pattern transparent (version 1.5). You'll need the LaserWriter 8 driver (Postscript Level 2) if you're printing to a Postscript device. To do this:
- select an object with a fill pattern that you want a transparent background pattern applied.
- tear off the pattern palette. The pattern for the selected object is highlighted.
- double-click the highlighted pattern to display the Pattern Editor
- click the transparent pattern in the pattern palette once. This changes the background (white) pixels in the Pattern Editor to transparent.

- click OK to dismiss the Pattern Editor window.
- Click on the highlighted pattern in the pattern palette once again to reapply it to the object.

c) Option-shift clicking the eyedropper on a gradient will pick up just the color directly under the eyedropper, rather than the entire gradient.

MacDraw Pro: Linear Blend vs Four-Corner Blend

In the Color Editor, there are two methods of blending CMYK colors?Linear Blend and Four-Corner method.

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.

Linear Blend: If you select a block of colors in the color palette (several adjacent rows or columns), then click the Blend button, you'll get a Linear Blend. The colors in the upper-left and lower-right corners are unchanged, while the colors in between are blended between the two colors. The result is that the colors selected in each row are the same color.

Four-Corner Blend - An alternative method of blending is the four-corner blend. This is done by holding down the Option key while clicking the Blend button. In this method, the four colors in the corners of the selected colors are unchanged, while the colors in between are blended from the corners. The result is that every color will be different.

Ethernet Backbone and Seed Routers

Here are some questions and answers about supporting AppleTalk on a corporate Ethernet backbone -- specifically, a group-managed, Macintosh-based Internet router which would be the sole seed router for the Ethernet.

This article has been archived and is no longer updated by Apple.

Q) Can all third-party routers that support the AppleTalk Phase 2 protocol accept seeding from the AppleTalk Internet Router?

A) All third-party routers that Apple Tech Comm is aware of can receive their network information from the AppleTalk Internet Router. It is best to confirm this information with the manufacturer of the routers that your account plans to use. Remember, there must be a seed router on every physical cable.

Q) What is the effect on the network if the seed router goes down for 24 hours or more?

A) Nothing, other than losing the ability to route packets to the networks on the other side of the seed router. If a router that depends on the seed router goes down, when it attempts to come back up it will not get a network number for the physical cable common to both routers and will not route.

Q) What is the effect if a user brings up a non-seed router with different network numbers and zone names?

A) All the routers of which Apple Tech Comm is aware will report that there is a network number and/or zone name conflict and will not come up. If a router did allow you to enter with an incorrect zone or network number information, many problems would occur. Network devices may not appear, or they may appear in different zones. Packets will be lost and many network errors will be generated.

Q) If I need to expand the seed routers network range and zone list, must I bring the other routers down for the update?

A) Yes, the seed router will attempt to run and notice that the network number range and/or zone name is different and report an error regarding the conflict. This necessitates bringing down the other routers on the same physical cable that get their network information from the seed router. As usual, the seed router must be up and running before the other routers are brought up.

MacDraw Pro: "Out of Memory" When Making Changes After Deleting Object.

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.

When an object is deleted, the memory used by the deleted object is not immediately freed up for other objects or operations. MacDraw Pro must keep the object in memory to allow an Undo of the deletion. This can be a problem, for example, if you delete a large bitmap or EPSF object from your document, then immediately attempt to cut/copy other objects while there is very little unused memory. (A large bitmap or EPSF object can use over a megabyte of memory in a MacDraw document). If this occurs, you will see a warning box that says, "Sorry cannot cut or copy current selection to the clipboard." This can also impair other memory-intensive operations, such as importing a large color palette.

To free up the memory used by the deleted object, perform another Undoable action.
1- Drawing a new object
2- Resizing, moving or otherwise altering an existing object.
3- Deleting another object. The deletion of that object will no longer be Undoable, so MacDraw can then free up that memory for other purposes.

Tip : An easy Undoable operation to perform: before selecting the cut/copy command, press one of the arrow keys on the keyboard. For example, pressing the Down Arrow key moves the selected object one pixel or one grid point downward. Then select the cut/copy command. Or, press the Down Arrow, then the Up Arrow key. This moves the object, then moves it again to its original spot. Then copy the selected object.

If you still can't cut/copy the object, see the entry titled "Sorry cannot cut or copy current selection to the clipboard."

MacDraw Pro: "Out of Memory" When Opening MacDraw II Documents

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.

A document created in MacDraw II may not open in MacDraw Pro on the same computer. This is because there is less memory available for documents when running MacDraw Pro. (Normally, this would only happen under extreme circumstances, such as reducing the RAM allocation for MacDraw Pro to 1000K, then trying to import a MacDraw II document).

The XTND engine and the MacDraw II filter also have to be loaded into RAM to function. This, combined with the increased memory usage of MacDraw Pro (vs. MacDraw II), means that you'll have less memory available for opening MacDraw II documents.

There are a few steps to allow more memory for MacDraw Pro to work with converted MacDraw II documents:

1. Turning off the RAM cache and removing INITs, then restarting the computer.
2. Increasing the MultiFinder memory allocation for MacDraw Pro (or restarting the computer under single Finder).

This will give you the maximum possible memory size for opening documents.

Published Date: Feb 18, 2012

MacDraw Pro: When Selecting "Turn On Slide Show", Slides Are Too Small

MacDraw Pro reduces the view to show the entire drawing size when turning on Slide Show.
Extra whole pages are added to the drawing to hold objects that you've moved, resized or pasted if the objects are touching or overlapping the page boundaries.

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.
Reduce the Drawing Size of your document.

- Select the Drawing Size command from the Layout pull down menu, then click in the small white square(s) in the upper-left corner of the gray drawing square, then click OK.

This reduces the drawing size to the minimum number of whole pages needed to hold the objects.

If MacDraw Pro won't let you reduce the Drawing Size to the number of pages you want, move these objects off the unwanted pages, then try reducing the Drawing Size again.

TIP: Setting the Drawing Size by clicking on the white squares in Drawing increases or decreases the document only in whole-page increments. You can resize the drawing size in finer increments than whole pages by typing in the drawings width and height. An easy way to reduce the drawing size to the minimum size without moving objects is by typing the number 1 into the width entry box, and the height entry box. MacDraw Pro will change your entries to the minimum dimensions necessary to hold your objects.

MacDraw Pro: "Sorry cannot cut or copy current selection to the clipboard."

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
"Sorry cannot cut or copy current selection to the clipboard."

This message means that there isn't enough unused memory available to hold these objects in the clipboard.

The following operations may make more memory available, thus allowing you to successfully perform the cut/copy.

1. Close another MacDraw Pro document that's currently open.
2. Shrink the size of the drawing window.
3. Select fewer colors in the Monitors cdev in the Control Panel.
4. If you're cutting/copying immediately after deleting another object, try moving the object, then retry the cut/copy operation.
5. If running MultiFinder, allocate more memory to MacDraw Pro.

(Please refer to your MacDraw Pro documentation for information on increasing the Application Memory Size.)

MacDraw II: Tips and Shortcuts-(cont.)

Tips and Shortcuts for MacDraw II version 1.1

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.

6. To save memory when using many copies of a scanned image (like a logo in a presentation), use the Duplicate command instead of the copy and paste. When you duplicate a bit-mapped object and donÕt change it, MacDraw II will save memory be only keeping a single copy and displaying it multiple times.

7. To quickly change the pen pattern, use the option key while clicking on the pattern palette. The new pen pattern will be displayed to the right of the pattern palette.

8. You can select all objects of a particular type by first selecting the corresponding tool from the tool palette, then choose Select All from the Edit menu. For example, you can select the Text tool followed by Select All. Now, any change you make will affect all text objects.

9. To see a smoothed curve while editing smoothed polygons, hold down the command key. MacDraw II will display the curve exactly as it will appear when you release the mouse button.

10. Use command + spacebar to activate the last tool you used.

11. To enter text into a graphic object, draw the object and begin typing text. For example, draw a rectangle and with the rectangle selected, begin typing text. The text will stay in the boundaries of the rectangle. If you want to enter text into a rectangle that you previously created, Option-Click on a rectangle and begin typing. The text will stay within the boundaries of the rectangle.

12. Use the <Enter> key to toggle from a tool back to the selection arrow.

13. To create a new slide, press command-shift-N.

14. To open a New MacDraw II document with all the default settings, hold down the Option key when you select New. This is only necessary if you have created a MacDraw II Options file.

Claris Software: Viruses, How to Remove

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
Viruses, How to Remove

The message "Your copy of 'application name' has been corrupted or modified by another application or a virus. Please make a new copy from locked master disks." can result from two sources:
1) viruses
2) manually modifying the app. with ResEdit or some other program.

Explanation and Solution
This alert is intended to serve as a warning that there is something wrong. Normally, you can proceed past this alert and use the application. However, as virus-infected software can be unreliable, you should eliminate the infected files from your disks as soon as possible.

It is unnecessary to reformat a hard disk to get rid of viruses. The basic steps are:
* Using a virus detection utility check the hard disk and any floppy diskettes for viruses.
* Trash all infected applications and system software.
* Replace infected files from uninfected locked master disks. If a master disk is infected, obtain new master disks from the software manufacturer.

More detailed and step-by-step explanation:

How viruses are transmitted
There are two main types of known viruses on the Mac. Some viruses embed themselves in the Desktop file (e.g. WDEF). These viruses can be transmitted by simply inserting an infected disk into a disk drive. Other viruses infect applications and system software by infecting them when they're launched or running. For example, when you double-click a Claris application to run it, the virus may immediately infect the application, which will cause the alert to be displayed. If you trash this application, reinstall it, then rerun it, the new copy of the application may become immediately infected. Thus, it may appear that the original disks are infected.

The most reliable way to prevent the spread of viruses is to lock or write protect disks. This is done by moving the black tab in the back of a diskette into a position that allows you to see through the hole. This is especially important for original copies of applications. Please lock all your original disks.

Steps to detect viruses
1- Get virus detection and removal software. These are available as shareware / freeware from user groups and online services, and as commercial software from computer and mail order firms. Be sure to get the latest version of the software.
2- Locate a disk with a System Folder on it, such as the system disks that come with your computer. Lock this disk. Restart the computer from this disk, so that the computer is running from the System folder on this disk.
3- Lock the floppy disk with the virus detection software on it.
4- Insert this disk, then run the virus detection software to check the system disk you used to restart the computer. If this disk is not infected, proceed to the next step. Otherwise, locate an uninfected system disk and start over at step #2 above.
5- Using the virus software, check all original floppy disks for viruses. If any original disks are infected, contact the software publisher for replacement disks.
6- Using the virus detection software, check the hard drive. Set the virus software to remove any viruses from any infected applications and system software. Print or save a report listing all files that have been uninfected.
7- Trash all files from the hard drive that were uninfected in the previous step.
8- Replace all files that were trashed in the previous step by recopying/reinstalling from original disks.
9- Run virus detection utility on the hard drive again to double-check that it's still virus-free.

Tips to prevent viruses
* Lock disks whenever possible. Viruses cannot spread themselves to a locked disk.
* Check all floppy disks before using on your computer. Often viruses are spread because someone ran their software or data files on another person's computer.
* Check data disks given to you. Some viruses can embedded themselves in the directory of a disk. These viruses can be easily transmitted by simply inserting a disk into your own disk drive.

MacDraw II: Objects pasted into other applications missing

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.

Issue #1:
Objects copied from MacDraw II and pasted into another application are missing on screen. Try this to help locate where the difficulty is occurring: In MacDraw II, copy the objects to the clipboard. Switch to the Finder. In the Finder, select Show Clipboard. Expand the clipboard window and view the objects. If the objects are all there, then they are exporting out of MacDraw successfully. The difficulty is probably due to something happening in the other application. If objects are missing in the Finder's clipboard, then they have not exported successfully from MacDraw. The difficulty is happening in MacDraw.

Try the following:
1) Copy and paste to the scrapbook, then copy / paste from the scrapbook to the other application
2) Save As to a PICT file, then import the PICT file into the other application
3) Check the destination application for Preferences - type options that may affect importing or pasting graphics.

Issue #2:
Objects copied from MacDraw II and pasted into another application are visible on screen, but not printing. This is usually due to a conflict with Print Monitor or other print spoolers. Try turning off the print spooler and printing again. Also, try turning off all options in page setup, then printing again.

MacDraw Pro: Cannot Change Fill of an Object

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
Check the fill indicator (the bucket) in the top left corner of the Styles Bar.

The fill indicator may not be selected. With the object selected, click on the fill indicator (or shift-click to leave the pen indicator chosen as well), then select the fill pattern/color combination.
Published Date: Feb 18, 2012

MacDraw Pro: Cannot See Handles on a Selected Object

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
There are a few instances when the handles of selected objects are not readily visible:

1. The object may be grouped with other objects. The handles would then be at the corners of the entire group. Select the Ungroup command. You should see the handles appear at the corners of the object.

2. On color monitors, the handles may be similar to the color of the objects in the background. MacDraw Pro always attempts to make the colors of the handles contrast with the colors of the objects in the background. However, for certain color combinations, the contrast between the handle color and the object color may be very slight.

If so, try the following:
- Temporarily move the selected object to a blank area of the drawing.
- Temporarily change the color of the objects in the background.
- Temporarily place the background objects on a different layer, then hide the layer.

MacDraw Pro: Cannot Apply Pattern to an Object

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
On black and white non-grayscale monitors, both colors and patterns appear as patterns, thus appearing very similar. You may apply a pattern to a colored object and see little or no change in the display of the object.

This can make it difficult to use the Style Bar if you put both patterned and colored items into it. The item you're selecting in the Style Bar may be a color and not a pattern at all.

You can select the correct color or pattern by using the colors or patterns pop-up palettes.

HyperCard: Microsoft Mail Conflict & Fix

I am experiencing problems using System Software 6.0.4, Microsoft Mail 2.0, and HyperCard 1.2.5.

While using HyperCard, I receive a Microsoft Mail message. At that point, my machine produces a high-pitch tone. (This tone cannot be stopped unless I quit HyperCard or initiate a beep tone from my Macintosh within HyperCard.

What's going on here? Is there a fix?
This article has been archived and is no longer updated by Apple.
HyperCard also has a similar conflict with some versions of InBox.

As of April, 1990, the only workaround is to turn off the notifying chime until the problem is resolved.

MacDarw Pro: Color Palette Shows Few Colors When Opening MacDraw II Document

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
If a MacDraw II document has at least one color other than black and white, MacDraw Pro creates a new color palette with only those documents colors in it when it imports that MacDraw II document.

It names this palette the MacDraw II document name and automatically makes this the active palette. When you click on the color palette icon, you may see a fewer colors than in the default Claris Colors palette.

To use the colors in the Claris Colors palette, tear off the color palette pop-up, then select the Claris Colors palette in the View menu.

MacDraw Pro: Double-clicking in Style Bar to Edit; Nothing Happens

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
You cannot edit items in MacDraw Pro's Style bar as you could in MacDraw II's Pattern Bar. This is because items in the Style Bar can contain combinations of patterns, colors and gradients.

To edit an item in the Style bar that has both a color and a pattern would require MacDraw Pro to be able to open both the pattern and color editor windows simultaneously.

To edit these items, you must edit them in the appropriate palettes for patterns, colors, or gradients , then place these items back into the Style bar.

TIP: If the item in the Style Bar does not exist in the palette, you can drag it from the Styles Bar into the palette with your mouse. Edit the pattern, color or gradient as desired in the appropriate palette, then drag it back into the Style Bar.

Here is how to edit a color/pattern combination:

1) Drag a color from the color pallette onto the Style Bar.
2) Select a pattern or drag a new pattern onto the Style Bar and select it.
3) Select the color. The patterned color should now show up in the fill indicator. Make sure you have no objects selected.
4) Drag the fill indicator onto the Style Bar.
5) You can get rid of the original pattern and color if you want at this time.

MacDraw Pro: Gradients Print With Wide Bands

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
If gradients are printing with noticeable bands rather than smooth transitions, check the following:

1) Are you printing from a color - capable Macintosh? Non-color ready Macintosh computers cannot print Gradients with smooth color blends (Mac Plus, SE, Classic, Powerbook 100). They lack the Color QuickDraw information in the ROMs needed for printing gradients (and for dithering solid colors in a document to equivalent grays when printing to black-and-white printer). MacDraw Pro allows users of non-color Macs to create full 32-bit color documents. However, these documents must be printed from color-capable Macs to achieve smoothly printed gradients.

2) Is the print dialog box set to print "Black & White" rather than "Color/Grayscale"? To print gradients with smooth gray changes, Color/Grayscale must be selected in the Print window when printing with the LaserWriter driver.

3) In Preferences, click the printing icon, then increase the number of gradient printing steps from 32 to a higher number, say 128. This will improve print quality to most Postscript printers and DeskWriters (version 5.0 of DeskWriter driver tested).

TIP: To make the gradient printing steps less noticeable, edit the gradient so that there is less contrast between the beginning and ending colors. For example, a gradient that shades from all white to all black would contain the maximum possible contrast between the beginning and ending colors. Try using a gradient that shades from, say 80% white to 20% white. The shade transitions will be closer together, so the banding in the gradient will be less noticeable when printed.

MacDraw Pro: Gradients Print Less Banded From EPSF

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.

Gradients will print smoother and with less banding from an EPSF image than as a MacDraw Pro object. This is because the EPSF XTND translator produces better gradient printing Postscript code than the LaserWriter driver.

Save the MacDraw Pro document as an EPSF file, then open the EPSF and print. The print quality difference is not really noticeable when printing to a 300 dpi printer, but is noticeable when printing to higher resolution printers, such as the Linotronic.

The "number of gradient steps" preference item in the printing preferences panel affects only native Draw Pro objects with gradients. It does not affect the quality of the EPSF file version that Draw Pro exports.

MacDraw Pro: Objects Copied to Clipboard Not Viewable in Finder Clipboard

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
When copying complex objects to the clipboard, then switching to the Finder and selecting Show Clipboard, you may see the message "Unable to Display the Clipboard. "

The Finder displays this message because it doesn't have enough memory to display the contents of the clipboard when it contains complex objects. These complex objects include large smoothed polygons, freehands, bezigons, EPSF objects or large color bitmaps. The objects are, in fact, in the clipboard and will paste into a document in another application.

To view the contents of these objects in the Finder, you can allocate it more memory, just as you can allocate more memory to MacDraw Pro. For more information, see the section on Memory in the MacDraw Pro Troubleshooting Guide.

MacDraw Pro: Slow Opening or Placing a MacDraw II file

MacDraw Pro opens MacDraw II files slower than MacDraw II.

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.
This is because the MacDraw II file has to be converted to MacDraw Pro format through the MacDraw II 1.1 Translator. The conversion process takes more time than opening a MacDraw Pro document, or opening a MacDraw II document in MacDraw II.

This conversion process includes converting all the colors and color patterns to similar solid colors in MacDraw Pro. Also, smoothed polygons in the MacDraw II document are converted to bezigons in MacDraw Pro.

A MacDraw II drawing with thousands of objects may actually take an hour or more to open in MacDraw Pro.

Hard Drive: Making It Read-Only

I want my internal disk drives to have a jumper that allows me to set the drive for read-only access. Can I do this? If so, which one and how do you set it?
This article has been archived and is no longer updated by Apple.
There is no jumper or switch on Apple hard drives that make them read-only. However, there are ways to do this via software.

The first method requires that the hard drive be formatted by Apple HD SC Setup 2.0:

1) Start up from a floppy disk and run HD SC Setup 2.0 from that disk.
2) Select the hard disk that you want to make read only.
3) Click the "Partition" button.
4) A new dialog appears; click the "Custom" button.
5) Click on the Macintosh partition (the hard disk name appears in the partition).
6) A new dialog appears; click the "Lock" button.
7) Click the "Done" button.
8) Quit HD SC Setup.

The Macintosh partition of the selected hard disk is now write protected.

You can also use a disk editor, such as FEdit (this method works with hard disks formatted by earlier versions of HD SC Setup):

1) Open the hex representation of the volume that you want to lock.
2) Go to sector number 2. (This should be the third sector on the disk, with each sector having a length of 512 bytes.)

3) The sector should look something like this:

****
```
4244 9FAE F13C 9FAF 228B 0000 0010 0003
0000 063A 0000 0200 0000 0800 0004 0000
0020 0488 0855 6E74 6974 6C65 6400 0000
```
..... and so on,

where the 4244 begins at the zero byte of the sector.

4) The key location is where you see the word with the "****" over it. It should be located at the tenth byte and be $0000.

5) If the 8000 is at the tenth byte, change it to $8000 and write the sector to disk.

6) Restart the system to have the change take effect. (This information is usually stored in memory and won't be updated until you restart.)

Running software from a locked disk is not advised unless the locked device is NOT the startup disk. Many applications create scratch files in the System Folder of the startup disk. If it's locked, the software probably won't run. Some software even expects its home disk to be unlocked. If the locked device is not the startup disk, and the user is only going to read from it, then everything should be okay.

MacDraw Pro: Applying Color to Gradient-filled Object Removes Gradient

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.

If you fill an object with a gradient, then apply a color to that object, the color replaces the gradient. The object is then filled with a solid color.

The correct procedure is to create a gradient with color, then apply that colorized gradient to the object, replacing the black-and-white gradient.

At first, it might seem that applying a color to a gradient-filled object should colorize the gradient in the object. However, a gradient can have up to 4 colors in its definition: the beginning color, the ending color and one or two intermediate transition colors. If you try to apply a color to a gradient-filled object, there is no way to specify which of these gradient colors to substitute for the new color. This is why it is necessary to create new gradients with colors in them.

MacDraw Pro: MacDraw II Multi-colored Patterns Converted to Solid Colors

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
Patterns from a MacDraw II document appear in MacDraw Pro as solid colors.

Color patterns in MacDraw II are frequently used to simulate solid colors, since MacDraw II is limited to the eight QuickDraw colors. When MacDraw II documents are opened in MacDraw Pro, patterns are converted to their solid color equivalents. Usually this is desired, since the resulting solid color is what was being simulated in MacDraw II. However, multiple-colored non-dithered patterns in MacDraw II are converted in MacDraw Pro even when a solid color is not the intended end result (for example, a two-colored brick pattern). There is no workaround at this time.

This pattern conversion takes effect when the "Convert Patterns to ... Colors" checkbox is set for the MacDraw II 1.1 Import settings in the Preferences/Translators dialog box of MacDraw Pro.

"Convert Patterns to ... Colors" is CHECKED ? This is the default setting. When checked:
1- Dithered patterns that include white and one other color are converted to solid colors.

- The MacDraw II XTND filter contains a table of about 200 dithered patterns. As the MacDraw II document is converted, each pattern is compared with the patterns in the XTND filter's pattern table. Any patterns that match those in the table are converted to solid colors.
2- Non-dithered patterns that include white and one other color are NOT converted (e.g., the brick pattern, diagonal lines pattern, etc.)
3- All patterns that include two or more non-white colors (dithered and non-dithered) are converted to solid colors. (MacDraw Pro only supports patterns that include white and one other color.)

"Convert Patterns to ... Colors" is UNCHECKED -- When unchecked:
1- Dithered patterns that include white and one other color are NOT converted to solid colors.
2- Non-dithered patterns that include white and one other color are NOT converted (such as the brick pattern, diagonal lines pattern, and so on)
3- All patterns that include two or more non-white colors (dithered and non-dithered) are converted to solid colors. (MacDraw Pro only supports patterns that include white and one other color.)

Why doesn't MacDraw Pro support more colors in its patterns? MacDraw Pro is not limited to the standard eight QuickDraw colors to define its colors, as is MacDraw II. MacDraw Pro uses Color QuickDraw and 32-bit QuickDraw. Patterns defined using Color QuickDraw (called a "pixpat") may not print reliably unless the pattern contains only white and one other color. This is a system-level issue not associated with MacDraw Pro. (Other drawing programs that attempt to offer full-color pixpat support may also have difficulties printing). MacDraw Pro was created to support only these white/2-color patterns to avoid these printing difficulties.

MacDraw Pro: Printing Drawings With Gradients

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.

If drawings with gradients are printing slowly, you can reduce the number of gradient steps in the Printing Preferences. The fewer the steps, the faster the document will print. Conversely, more gradient printing steps will print much smoother transitions between gradient steps, but can increase printing time tremendously.

There is no benefit to increasing the number of gradient steps beyond what the printer can support. For example, most 300 dpi LaserWriters (without PhotoGrade or some other enhancement) can print a maximum of 32 gradient steps. This is the maximum gray levels that the LaserWriter can support with acceptable resolution. Selecting more than 32 gradient steps when printing to a LaserWriter will not result in better print quality of gradients, just longer printing times.

MacDraw Pro: Text Appearing On Screen Slowly

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
Text is drawn to the screen more slowly in MacDraw Pro 1.0 than in MacDraw II or MacDraw Pro 1.5.

The following points explain text behavior and suggest methods of creating text which will offer the fastest performance:

1) Caption text is slower drawing to the screen than typing into a text block.
(Caption text is when you select the text tool, click on the document, then start typing. Thus, you're typing without defining a right border for the text.). Instead, create a text block, then type into the text block. You create a text block by selecting the text tool, then drawing a rectangle on the document. This sets the borders for the text block on all four sides. Then start typing.

2) Inserting text in the middle of a text block is slower than typing text at the end of a text block. (Breaking the text into smaller text blocks speeds up the text editing/redraw.)

3) Text redraw is slower when Kerning by Pairs is on. Turning Kerning by Pairs OFF will speed up text redraw.

AppleShare File Server and Virus Protection

What are your recommendations on virus protection for file servers?

Also, can a server be infected with the WDEF virus? If so, since WDEF is spread by a machine coming in contact with an infected disk's Desktop file, how is it spread? Does a server access a workstation's Desktop file?

This article has been archived and is no longer updated by Apple.
Apple Tech Comm does not recommend using INITs that offer virus protection on file servers. A server will freeze if a dialog appears alerting the nonexistent user about an infection attempt. We suggest that instead you use a program that scans the AppleShare File Server for viruses on a regular basis.

The AppleShare Server Folder itself is quite secure when the server is running. Is it not accessible by any system call, whether high-level or low-level. A virus can attack only folders and files for which the user of the infected program has write access privileges. It is not necessary or recommended to install Vaccine in the Server Folder on the AppleShare File Server. If the server is running at the Finder level, it is just as susceptible to viruses as any system.

An AppleShare file CAN become infected with the WDEF virus. When any new volume is mounted, the WDEF virus looks for a file called "Desktop" at the root level and copies itself into it. Once the file server is infected with the WDEF virus, the virus is dormant because the Desktop file is not accessed by workstations and is not used by the file server.

MacDraw Pro: Creating Angled Lines of Exact Fractional Lengths

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
When drawing objects, you can make MacDraw Pro show the dimensions in the Show Size bar in exact units without decimal values.

Examples:
4'-8 1/2" (4 feet, 8 1/2 inches)
12p6 (12 picas, 6 points)

You do this by setting the appropriate ruler settings. For example, to display in feet and inches, in Rulers, set the ruler for Scaled Size to "Feet" increments, then set the divisions per inch to 12 (or 24, or some other multiple of 12). When you draw an object, the Show Size bar will display in feet and inches (and fractions) instead of decimal amounts. You must also have the Autogrid ON when drawing for this to occur.

Drawing angled lines, however, will usually result in the line length being displayed as a decimal. This is because the distance between grid points is usually not an even amount for angled lines.

If you need an angled line of an exact unit or fractional length, draw the line horizontally or vertically, then rotate the line to the desired angle using the Rotate command.

Published Date: Feb 18, 2012

MacDraw Pro, MacDraw II: Drawing or Rotating to an Exact Angle

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.

Drawing a line at a specific angle can be difficult for fractional angles (for example, 23.34 degrees). Likewise, rotating an object to a fractional angle can be difficult. You can save time and steps by drawing the line horizontally or vertically, then use the Mouse Constraint feature while rotating the line. Likewise, this technique can be used to rotate any object to an exact fractional angle.

1. Select the Preferences command from the Layout pulldown menu. (Shortcut: double-click on the corner-center control.)

2. Select the Mouse Option.

3. Click the radio button marked "Custom" under Mouse Constraint, and enter the degrees rotation into the Entry box.

4. Click OK to close the Preferences window.

5. Select Rotate, and rotate the object while holding down the shift key.

The rotation will be limited to 90 degree increments and the custom angle. For example, setting a custom mouse constraint of 15 degrees limits rotation to 0, 15, 75, 90, 105, 165, 180, 195, 255, 270, 285 and 345 degrees.

Published Date: Feb 18, 2012

MacDraw Pro: Rotating In Small Increments

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
When rotating an object, the rotation degree increments depend on several things.

1) If the grid is on, the rotation conforms to the grid. Increasing the rulers divisions will allow you to rotate in finer increments. Likewise, turning the grid OFF will allow you to rotate in pixel-level increments.

2) How far you drag from the pivot point. After selecting the objects handle to rotate, you can drag away from the object while rotating. This will give you a wider "sweep" or circumference around the pivot point of rotation. A wider sweep will let you rotate in finer increments.

3) The zoom level. If you zoom out to a reduced view, then drag away from the pivot point while rotating, you'll get an even wider sweep.

To get the maximum precision in rotating, turn the grid off, zoom out to a reduced view, then drag away from the object's handle while rotating.

MacDraw Pro: "Out of Memory" Message In Layers Dialog Box

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.

If you delete layers in the Layers dialog box, then attempt to add or duplicate layers, you may see an "Out of Memory" message.

Deleted layers are not purged from memory until you click the OK button. This is necessary in order to allow you to click the Cancel button, thus canceling deletions and other changes made in Layers. If this happens, delete the layers, click OK, then reselect the Layers command and create or duplicate other Layers.

Claris CAD: Info Window Changes Numbers Unpredictably

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.

If a user enters a number into the info window and it changes when he presses enter, there are two possibilities. If the number always changes to something very close to the original and always changes to the same number (i.e. 1.000 becomes .999) then it is the SANE INIT rounding problem, and he should remove the INIT from their system folder. But...

If the number changes to a different number (i.e. 1.000 becomes 1.023, then on the second try it becomes .987) then it is a known issue with Claris CAD 2.0v1 and 2.0v2 that is fixed in 2.0v3.

Claris CAD: CGT Issue With AutoCAD DXF Files

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
When Claris Graphics Translator translates a DXF file from AutoCAD sometimes difficulties can arise.

1. Make a back-up copy of your AutoCAD .DWG file.

2. In AutoCAD do the following.

3. Use the command Handles and type in "destroy" and Autocad will come with a message that gives you the opportunity to destroy all handles. (Note: The Handles function is equivalent to Claris CADs' "object data".) This message will be unique every time that you use the "destroy" option. There will be a phrase in quotes that you must type in to verify destruction.

4. Bring this new file to Claris Graphics Translator and translate the file.

EtherTalk 2.0: Needs AppleTalk Driver v53

You may discover a compatibility problem with some networks (usually demonstration networks where many different types of software have been used).
This article has been archived and is no longer updated by Apple.
The problem occurs when a server has first had EtherTalk 2.0, installed, then later has had EtherTalk 1.0 or 1.2 installed. AppleTalk driver version 53 -- which is installed with EtherTalk 2.0 -- does not work with earlier versions of the EtherTalk driver.

When switching from EtherTalk 2.0 to EtherTalk 1.0 or 1.2, AppleTalk driver v53 must be removed from the System Folder and replaced with AppleTalk driver version 52, which works with EtherTalk 1.0 and 1.2.

The removal must be done manually, by dragging the AppleTalk driver icon from the folder. Installing the new version can be done either with a Finder copy, or through the EtherTalk 1.0 Installer.

AppleShare PC: Printing to ImageWriters

Can you print to an AppleTalk ImageWriter from a PC using a LocalTalk PC Card and AppleShare PC 2.0? Also, does the current version of AppleShare PC include the drivers that allow printing to this device?

I have heard that AppleShare PC prints to both the ImageWriter II and the ImageWriter LQ printers.

This article has been archived and is no longer updated by Apple.
The AppleShare PC Desk Accessory does provide a network choice for the ImageWriter II and ImageWriter LQ printers.

AppleShare PC has included AppleTalk Printer Drivers for the ImageWriter II and ImageWriter LQ since version 1.1. This was not available in AppleShare PC 1.0. Anyone using a version of AppleShare PC that does not have the ImageWriter drivers as a desk accessory option should upgrade to the latest version of AppleShare PC version 2.01.

About ImageWriter printing:

AppleShare PC first requires the PC application to choose its own Epson driver or ImageWriter driver. If the application has an ImageWriter driver, AppleShare PC will manage only the AppleTalk connection. If the application supports only Epson printing, AppleShare PC will handle the AppleTalk connection to the ImageWriter and convert the application's Epson commands to ImageWriter commands. This requires the user to configure the AppleShare PC connection to the ImageWriter with the Epson print option.

Claris Software: TrueType (System 7.0) Compatibility

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
Text printed in Final mode with MacProject II and MacDraw II shows a marked improvement with the addition of TrueType.

However plotting text in Final mode from Claris CAD 1.0v3 or higher (which plot at a higher resolution), takes more memory and more time to plot than before. In fact, it will stroke each letter hundreds of times as if it were drawing with a "very" small pen. With some paper this will result in "laser-quality" text while other paper may be become torn in this process. This behavior is not witnessed in the 3.7v4 version of MacPlot Professional which provided compatibility with outline fonts.

MacDraw Pro: Color PICT2 Files Print In Black And White

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.

Color PICT2 files print in black and white from black and white Macintosh computers (Mac Plus, SE, Classic). This is because black and white Macintosh computers do not support Color QuickDraw. (Note: Mac SE/30 has color QuickDraw in ROM, even though the monitor is B&W.)

Published Date: Feb 18, 2012

MacDraw Pro: Color Separation Information

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
MacDraw Pro does not have built-in color separation capabilities.

To print color separations of a MacDraw Pro document, you must save as an EPSF file, then open the EPSF file in another program that can print color separations. This is explained in the MacDraw Pro Color Guide pg. 3-6, 3-7.

Programs that can print color separations from an EPSF image include Quark XPress, Adobe Separator, Aldus Preprint, Aldus Freehand.

Some programs produce more accurate color separations and offer better separation controls than others. If you take the same EPSF image from MacDraw Pro and produce color separations in different programs, the color separations will not be identical. Thus, if the color separation is not accurate, it is possibly due to the abilities of the color separation program, and not due to the quality of the EPSF image produced by MacDraw Pro.

Claris Software Quality Assurance has found that Quark XPress seems to produce the most accurate color separations (based on the versions of tested products available as of April 1991).

MacDraw Pro: Colors on Screen Change When Launching

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
When opening the MacDraw Pro application or the Color Editor, you may see colors in other windows and in images on the desktop flash to other colors.

This happens because the Claris Colors palette that MacDraw Pro uses is different than the Macintosh System color palette. If your video interface is set to 256 colors or less, it cannot simultaneously display all the colors in the Claris Color palette and the Macintosh default palette.

You can eliminate the flashing color changes in the background by:

1) Setting your monitor to display more than 256 colors, or
2) Use the Apple System Color palettes to create your drawings instead of the Claris Colors palette. MacDraw Pro disks include a choice of three Apple Colors palettes.

LaserWriter as a Serial Printer

I've been doing some work with the Asynch LaserWriter drivers, testing a mixed DOS/Macintosh environment.

1) When the LaserWriter is used as a serial printer, does it respond to ASCII codes with the 8th bit set the same as codes with the 8th bit not set? For example: Is 83h = 03h, 84h = 04h, 93h = 13h, 91h = 11h?

2) Does the LaserWriter respond to the above control codes when in AppleTalk mode as well as when in serial mode?

This article has been archived and is no longer updated by Apple.
These questions are interrelated, and the answers may be easier to follow if we answer #2 first.

2) A control code is used by a printer for a specific printer function. When the printer is in AppleTalk mode, the PostScript program language is used, and uses words to activate or invoke printer functions, not control codes. However, the printer uses control codes if it is in Diablo or LaserJet (if available) emulation mode.

1) If the printer is in Diablo or LaserJet mode, the above is correct if it is set for 7-bit data with no parity check, as the 8th bit is dropped -- but if the printer is in 8-bit mode, the mapping is not equivalent.

(NOTE: Part of the printer configuration requires you to select whether 7- or 8-bit communication and parity is used, so

MacDraw Pro: Drawing Objects With Freehand Tool Won‘t Autoscroll Window

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
When drawing with the freehand tool, if you draw outside the window, the window will not scroll.

This is different than other drawing tools, which will autoscroll the window when drawing. However, if you draw outside the window boundary, the freehand object will be drawn on the drawing. You can manually scroll the window after drawing to see the effects of this drawing. MacDraw II functions the same way when drawing freehand objects.

To replicate this:

1) Set the drawing window so that it doesn't go to the right edge of the screen.
2) Draw with the freehand tool, dragging past the right side of the document window.
3) Scroll the window to the right. You will see that the freehand tool drew as if the window had extended farther to the right, although the window didn't scroll to make that area of the drawing visible.

MacDraw Pro: Gradients in EPSF are of Low Quality

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
Gradients in EPSF images may appear lower quality on screen than the original gradient object. This includes EPSF images created in MacDraw Pro and viewed in other applications. Likewise, a gradient created in another application, such as Freehand, then imported into MacDraw Pro as an EPSF, may also look poor on the screen.

When viewing an EPSF image on the screen, you are viewing the PICT preview portion of the image. You are not viewing the Postscript definition of the objects. Thus, what you see on the screen is only an approximation of what will print.

The gradients in the EPSF will print correctly, even though they look poor on the screen. In fact, the print quality of a gradient in an EPSF image is slightly superior to a gradient in a native MacDraw Pro object.

MacDraw Pro: Gradients in PICT Files Viewed With Other Applications

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.

If you create a document with gradients, save as a PICT file, then open the PICT file in other graphic programs, the gradients may not be correct. This is due to the other program's inability to read our gradient information in the PICT file, and not due to any problems in MacDraw Pro. The following information outlines the performance of other programs reading gradients from MacDraw Pro PICT files.

Studio 8: Gradients look banded, with very coarse transitions between gradients. Studio 8 is mapping the colors in our gradients to match the colors in its own color palette.

Studio 32: Gradients look very good, with very smooth color transition. No problems observed.

SuperPaint: Gradients appear as solid black fill, with no color transition at all.

PixelPaint Pro: Gradients look very good, with very smooth color transition. No problems observed.

Freehand 2.0: Gradients appear with smooth color transition. However, the gradient spills out way beyond the border of the object, especially with bezigons.

MacDraw Pro: Handling of Text Tabs versus MacDraw II

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
MacDraw II does not support tabs. (Tabs are treated as spaces.) MacDraw Pro supports true text tabs. When opening a MacDraw II document in MacDraw Pro, tabs are converted to spaces. This is done so that the character spacing will remain the same.

However, when saving a MacDraw Pro document as a MacDraw II file, tabs are not converted to spaces. The tab characters remain in the text blocks. Since MacDraw II treats the tab as a space, tabs will cause only a single space to appear at the tab.

MacDraw Pro users should create their documents accordingly. If the user knows that they are creating the document for MacDraw II users, they should not space text with tabs, as this feature is not supported. (Of course, this goes for any other feature that MacDraw II doesn't support, such as gradients, most colors, etc.)

MacDraw Pro: Gradients Become Banded or Undithered

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
When enlarging a large gradient-filled object, the display of the gradient may lose its dithering. The gradient will appear with noticeable bands of color, without dithering. This effects screen display only, not the quality of printing. This only occurs when the video is set to 256 colors or less.

Increase the memory for MacDraw Pro, or switch to 24/32-bit video mode (millions of colors). Additional workaround: see explanation below.

Gradients are defined in MacDraw Pro using 32-bit QuickDraw, even though the monitor may be set to display fewer colors, such as 256. In this way, gradients can be printed in the highest possible quality regardless of the number of colors that can be displayed on screen. When displaying gradients on a color screen set to 256 colors or less, MacDraw Pro dithers the colors in the gradients. This dithering results in a gradient with smoother looking color transitions (without noticeable bands of colors). The gradient may be displayed using only the 256 available colors, but the dithering gives the appearance of more colors.

A large gradient-filled object requires lots of RAM. For example, a full-screen rectangle with a gradient displayed on a 13-inch color monitor may use about a megabyte of memory. Increasing the size of a gradient-filled object increases the RAM used. If you increase the size of a gradient-filled object, MacDraw Pro may run low on available RAM. When this happens, MacDraw Pro will switch to displaying the gradient in Fast Display mode to conserve RAM (no dithering).

The RAM used to display gradients in high quality is not shown in the memory usage indicator in the About MacDraw Pro window. Thus, even though this indicator may show that there is a megabyte or more of available memory, MacDraw Pro may be using most or all of this memory for things like displaying gradients in high quality.

TIP: When a gradient is displayed using the Fast Display mode, MacDraw Pro uses the colors defined in the current color palette to display the gradient. If the current color palette contains few intermediate colors between the 2-4 colors that define the gradient, MacDraw Pro will have few colors to display the gradient. Thus, the gradient may display with only a few very wide bands of color, instead of many smaller bands of colors.

If you add colors to the current palette that are intermediate to the colors in the gradient definition, MacDraw Pro will display the undithered gradient with more colors. Thus, you can make the undithered gradient display quality better. You can create these intermediate colors by creating colors that are a blend of the colors in the gradient definition. You can then place all the colors (the gradient colors and the intermediate blended colors) in the Style Bar. This way, if the total colors in the Color Palette and Style Bar exceeds the number of colors that your video card can display, these colors will be given priority for being displayed as solid colors.

MacDraw Pro: Some Colors Appear As Dithered Patterns

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
Some colors appear as dithered patterns, instead of solid colors. This effects screen display only, it has no effect on printing.

To change the dithered colors to solid colors:
1. Select the color(s) in the Color Palette, then Choose Solid from the palette's Special menu.
2. Place preferred colors in the Style Bar.
3. Increase the number of colors in the Monitors Control Panel.
4. Eliminate unused colors from the active Color Palette, thus decreasing the total number of allocated colors.

If the total allocated colors exceeds the colors that can be displayed on screen, MacDraw Pro will dither some of the colors. (Total allocated colors includes all the colors in the current palette, plus all the colors in the Style Bar, plus a few reserved colors). This dithering allows you to create documents with thousands of colors even though your monitor may be able to display only 256 colors. The additional colors beyond 256 will be displayed as a dithered pattern, closely simulating the true solid color that it represents. If you want to change a dithered color back to a solid color, select the dithered color in the Color Palette, then select the Solid command from the Special menu. MacDraw Pro will revert the dithered pattern back to the solid color. However, MacDraw Pro will then have to convert other colors in the palette to dithered colors to accommodate this action.

If you have certain colors that you want to always display as solid colors (such as colors used to display gradients), place those colors in the Style Bar. Colors in the Style Bar are given priority over colors in the palette for display as solid colors.

Claris Software: Problem Pasting Excel 3.0 Charts

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
There is an issue with pasting charts from Excel 3.0 into MacDraw II, as well as other drawing programs (MacDraw Pro, Claris CAD, Canvas 2.1, Freehand, SuperPaint and MacDraft). The axis text comes in all on one line, instead of at each axis point. Also, in one test chart, the bars in the bar graph did not paste at all.

These same charts do paste into MacDraw 1.9.X with the text placed correctly. Thus, one workaround is to paste the chart into MacDraw 1.9, then copy and paste into MacDraw II. Excel 3.0 charts DO paste properly into programs that read the chart as a single graphic object (MacWrite II, Word, PowerPoint, SmartForm, PageMaker, etc.)

In addition, when copying cells as a graphic using Excel's camera tool (which automatically converts the selected group of cells into a clipboard graphic) an ungrouped bunch of text and graphic objects is created. This group, when pasted into MacDraw Pro or II, can be fully manipulated. There have been reported difficulties with the clipboard handling graphics across company programs, i.e. Excel to Word is not an issue, but Excel to MacDraw Pro, MacWrite II, or Canvas causes the items to drop out, or run together. Solution Three solves this.

Solution One: Microsoft has released an update, 3.0a.

Solution Two: PictFixer - This shareware INIT permits charts to be copied from Excel 3.0 into several popular drawing programs which currently don't understand Excel's new clipboard info. These programs include MacDraw II, Canvas 2.1, DeskDraw 3.0 and Superpaint 2.0.

File: PictFixer Release _.sea (18421 bytes)
DL time (2400 baud): < 2 minutes
Download count: 17
Uploaded on: America Online AUTHOR: Morgan Belford

Solution Three: Microsoft has released an init to allow users to correctly paste their Microsoft Excel 3.0 charts into MacDraw II and MacDraw Pro, Canvas, etc. If you have any further questions about the INIT - Chart Pasting, or, if you have difficulty installing the INIT, please contact Macintosh Excel Product Support at (206) 635-7080. Technicians are available from 6 am to 6 pm PST. The init is available on CompuServe in the Microsoft Forum:Excel Library:CopyIn.

The following is a copy of the Read Me document that accompanies the Chart Pasting INIT from Microsoft:

7/25/91

This disk contains:
ChartPaster INIT
Read Me

The ChartPaster INIT is designed to allow you to copy charts to all draw programs without loosing the positioning of your text. The INIT should also eliminate any text positioning problems with worksheet pictures pasted into certain draw programs.

Note: You must be running under MultiFinder for the INIT to be effective.

How to install the ChartPaster INIT:
System 6.0.x:
Drag the INIT from the diskette, and place it in your System Folder. Note that the INIT will not be functional until after you restart your Macintosh.

System 7.0:
Drag the INIT from the diskette, and place it in your Extensions folder. This folder is located within your System 7.0 folder. Note that the INIT will not be functional until after you restart your Macintosh.

EPROM Burners for Macintosh

Is there an EPROM programmer device or software that can be connected to the Macintosh ?

This article has been archived and is no longer updated by Apple.
You have quite a few options. If you search the Redgate Buyer's Guide or MENU/Software Library on the keywords EPROM and Macintosh, you'll get a list of many software applications. Many of these programs generate object files in Motorola S, Intel Hex, and TEK-Hex (Tektronics format) record formats, used by a majority of PROM burners. Some programs have their own built-in communication emulation package, while others require you to use a terminal emulation program, such as MicroPhone or MacTerminal, to downloaded to an emulator or EPROM programmer connected to the Macintosh modem or printer port.

We have also seen various PROM burners advertised in the Macintosh magazines. A check of back issues should help you develop a list of names.

MacDraw Pro: Bitmaps Print with Lines or Moire Patterns

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.

MacDraw Pro documents with 72 dpi bitmaps may print the bitmaps with patterns, lines or moire patterns in them when printing to 300dpi printers (such as the LaserWriter and DeskWriter).

In the Page Setup Options, turn on the Precision Bitmap option (or other similarly worded option) to reduce the printing by 4%.

72 dpi bitmaps are not an even fraction of a 300 dpi printer. By reducing the printing by 4%, the bitmap will be 25% of the resolution of the printing (72 Ö 288). Thus, the bitmap will print without patterns in it.

This is not specific to MacDraw Pro. It is required when printing 72 dpi images from all Mac software.
Published Date: Feb 18, 2012

MacDraw Pro: Can‘t Place 32-bit TIFF Or PICT Graphics

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.

When trying to place 24 / 32-bit graphic images, such as TIFF or PICT, the image is not placed into the document. No warning box or dialog box is displayed.

Install the 32-bit QuickDraw INIT, then restart the computer.

To place 32-bit graphic images into MacDraw Pro, the 32-bit QuickDraw INIT must be installed (or in ROM). This is true even for Mac Plus, SE, and Classic, which do not otherwise require the 32-bit QuickDraw INIT to run MacDraw Pro.

MacDraw Pro, Claris CAD: Colorized Bitmaps Saved As EPSF Print Black

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
This is fixed in the EPSF translator included with MacDraw Pro 1.5

Colorized bitmaps print black when saved as EPSF using the EPSF Translator v1.0 for MacDraw Pro 1.0v1 and Claris CAD 2.0v3

The following steps recreate the behavior:

1) Import a black and white bitmap (such as those from MacPaint or HyperCard)
2) Colorize the bitmap by selecting colors for the pen and/or fill of the bitmap
3) Save as EPSF
4) Print the EPSF

The bitmap will print as black and white.

MacDraw Pro: Duplicated Objects At Odd Zoom Levels Appear Different

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
Object duplicated at a zoom level may appear to be different in size.

This is due to rounding error that can occur at certain odd zoom levels. The objects are, in fact, the same size.

The following steps will illustrate:

1. Set the pen width to 0.01 point.
2. At 100% zoom, draw a square about 1/2 inch wide.
3. Duplicate the square and drag it to the right.
4. Zoom to 351%.
5. Duplicate the first square again and place the duplicate over the second square.

Although both squares are 1/2 inch wide, one will appear to be a pixel larger than the other.

MacDraw Pro: EPSF Image Via Clipboard Doesn‘t Print High Quality

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.

If an EPSF object is copied from MacDraw Pro, then pasted into another application, only the PICT preview portion of the EPSF is pasted. The Postscript portion is stripped out. The resulting image that is pasted is not an EPSF object, but a PICT with a single object, a 72dpi bitmap. Thus, printing the object will be poorer quality than printing the EPSF object.

The Macintosh clipboard does not support the EPSF format. To move EPSF from one program to another, the EPSF must be exported to disk, then imported / placed into the other program.

MacDraw Pro: How To Create Slide Show With Colored Background

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
When viewing a slide show with a colored background, white strips 1-2 pixels wide may appear on the left and top of the screen.

To create a background color that fills the screen when viewing a Slide Show, try the following procedure on the Master slide:

1. Turn the Autogrid OFF.
2. Set the current pen width to zero points. You may have to select the Pens... command to create this as a custom pen width.
3. Go to the Master Slide and draw a rectangle to fill the entire drawing.
4. Use the cursor keys to nudge the rectangle towards the upper left corner of the drawing. Scroll to the lower right corner of the drawing and, if necessary, expand the rectangle to fill the entire drawing. (You may want to zoom in to expand the rectangle with more precision.)
5. Change the fill and pen of the rectangle to the desired color/pattern/gradient combination and send the rectangle to the back if needed.
6. Select Turn on Slide Show.

To create a slide show that doesn't shrink to fit the screen, set the drawing size to 8.89 inches wide and 6.67 inches high.

MacDraw Pro: Imported Objects With Zero Line Width Not Rescaling

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.

If you import an object with a zero line width from other drawing programs, then attempt to resize the object using the Rescale When Pasting command, the objects may not resize. (This includes objects from MacDraw 1.9.)

This is due to the objects frame not being defined by the other program.

The workaround is to change the pen width of the objects, then rescale.

MacDraw Pro: Alignment Of Mixed-size Multi-line Text

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
A text object with multiple line of text in different point sizes will not be perfectly aligned left.

To recreate:

1. Create a text block with several lines of text.
2. Change the first character(s) in each line to various sizes.

Look at the left alignment of the first character in each line of text. The first letters may not be left-aligned perfectly. (The discrepancy might be so small, you need to zoom in to notice.)

This is because the character definitions include white space to the left of the character (the character widths defined in the fonts are wider than the actual characters and include some leading white space). Larger font sizes will have more leading white space than smaller sizes. Thus, if the first character in a line of text is a larger font size, the line may appear to be shifted to the right by a very small amount. This may occur with some fonts more than other fonts. Also, some TrueType fonts may be off more than their Postscript equivalents.

MacDraw Pro: Slide Show Showing With Reduced Objects

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
When viewing a slide show, MacDraw Pro will shrink the entire drawing size to fit the screen. Thus, if the drawing size is larger than the screen, the objects will be reduced along with the drawing to fit the screen. Bitmapped objects that are reduced may appear distorted on screen.

To create a slide show that doesn't display the slides reduced, set your drawing size to the following sizes:

Apple Color 13" RGB (or any monitor with 640 x 480 resolution):
8.89 inches wide x 6.67 inches high

You can set your drawing to this size by typing these dimensions into the Drawing Size dialog box. If you've already created objects that are beyond these dimensions, you will have to move them to within these dimensions before you can reduce the drawing size.

MacDraw Pro: Text Clipped When Opening Or Placing Text

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
Text may be clipped on the right when opening or placing text in a font not installed in your system.

If you open a text file that contains a font not installed in your System, an alert box will appear telling you that a font in the document is not available and that an available font will be substituted.

The installed font used to display the text may have wider characters than the actual text font, clipping your text on the right.

MacDraw Pro will not automatically widen the text block to accommodate the substituted font's character widths. You can either widen the text block with the selection handles, or install the missing font in your system.

MacDraw Pro: Text Scaling Precision With Scale Command

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.

When scaling text with the Scale Selection command, text is scaled to the nearest 1/4 point. Thus the size of the text may not scale in the exact percentage entered into the Scale Selection command. This may cause slight alignment problems if text and graphics are placed tightly together, then Scaled. For example, if you scale 18 point text scaled to 71% size will scale to 12.5 or 12.75 points, not 12.78 points (18 * .71).

When you select text that has been scaled and is not a whole-point size, the font size will not be checked in the Size menu. The Size menu can display only whole-point sizes.

Claris CAD: SuperMac Compatibility

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
Users have reported intermittent difficulties with SuperMac monitor cards and Claris CAD 2.0. We have been able to pinpoint it to 2 sources:

- On Macintosh IIfx, IIci and certain other Macintosh systems, intermittent difficulties were solved by updating to Claris CAD 2.0v2 or newer.

- Users with SuperMac Series II cards: Some users had cards that are not placed into their slots entirely correctly. The best way to correct this is to call SuperMac for a service call to reseat the card. However, if you want to take a chance, here is the process to reseat the card yourself:

1. Turn off the computer
2. Move the card from its current slot into another empty slot. Place it in the slot carefully, making sure it sits well in the slot.
3. Restart the computer with the space bar held down.

The computer will search for the card in the new slot and re-initialize it.

MacDraw Pro: Adjusting Print Halftone Screen Frequencies And Angles

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
MacDraw Pro always prints using the default halftone settings of the printer. You cannot adjust the halftone screen frequencies and angles for printing within MacDraw Pro. In contrast, MacDraw II prints using a 60 line screen to all Postscript printers, unless adjusted using the MacDraw II Configure utility.

The halftone settings can be adjusted in the EPSF translator for export.

1. Select the Preferences command.
2. Click the Translator button.
3. Select EPSF export in the pop-up menu, click Set, then click the B&W or Color radio buttons.

Entry boxes will appear to enter new settings for the line screen frequency and angles for the four print colors (a single set appears for B&W). When you save your image to an EPSF file, the file will be saved using the new settings. Open and print the EPSF file to use the new line screen frequency and angle settings.

MacDraw Pro: Default Fill Of Some Objects Always Transparent

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
The default fill of text, arc, freehand, polygon and bezigon objects is always transparent. Any color, pattern or gradient placed into the fill indicator is ignored when these objects are created.

To fill these object types, select the object, then click on a pattern in the Pattern Pallette.

You can set freehands, polygons and bezigons to auto-fill on creation by turning on this option in the Preferences... Polygons, under the Layout menu.

Text and arc objects, however, always auto-fill with a transparent fill.

Rectangles, rounded rectangles and ovals always auto-fill with the current fill pattern when they're created.

MacDraw Pro: EPSF Images Pasted into MacWrite II or MS-Word

EPSF images copied and pasted from MacDraw Pro into MacWrite II or Microsoft Word will print at a low (screen bitmap) quality.

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.
The Macintosh clipboard doesn't support EPSF. The graphic object that pastes into MacWrite II/ MS Word is the PICT Preview portion of the EPSF, which does not contain the Postscript portion of the EPSF.

Neither MacWrite II nor Word 4.0 support EPSF. (The EPSF filter from FileMaker Pro shows in the MacWrite II Insert File pop-up list, but only the PICT Preview is read. Word does not have any file Import commands to import graphic files from disk).

The following workarounds are available:
1) Importing EPSF objects into Microsoft Word: instructions for doing this are on page 288 of the Word Reference manual. You can import EPSF files by holding down the shift key when selecting open. You have to alter the bounding rect of the graphic (there are instructions).

2) Work with non-EPSF objects to transfer (MacDraw Pro objects, PICT, TIFF and/or bitmap objects). These objects will copy/paste correctly. Or, save as a PICT file and import into MacWrite II.

3) If the MacDraw Pro document includes both MacDraw Pro objects and EPSF objects imported from another program: consider locating the source documents for the EPSF and bringing these objects into MacDraw Pro as PICT. Or, consider combining the text and graphics in a page layout program, rather than in a word processor.

4) If the MacDraw Pro drawing takes up a full page, leave a blank page in your word processing document where the graphic would have gone. Then leave your drawing as a MacDraw Pro document and print it separately. The word processing document will paginate correctly, and you'll get maximum print quality.

MacDraw Pro: Right-Justified, Bold Text Truncated In Clipboard

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
When copying right-justified text to the clipboard the text might be truncated on the right.

The following steps recreate the problem:
1. Create a single line text block that is right-justified and bold text.
2. Turn off Fractional Character Widths (FCW) and copy the text to the clipboard.
3. Select Show Clipboard.

The text may be truncated on the right in the clipboard. The text may Paste and print truncated. This only occurs with some fonts, including Helvetica.

When copying right-justified text to the clipboard for pasting into other applications, turn on FCW. This will give you the most accurate character widths without truncation on the right. To do this, the application you're pasting into must support FCW and have it turned on.

LaserWriter: Suppressing Control Characters

This article has been archived and is no longer updated by Apple.

A customer who is spooling PostScript files from a VAX to a LaserWriter wants to know if it's possible to suppress the LaserWriter's EOT acknowledgment or timeout messages.

There is no way to suppress the LaserWriter's EOT acknowledgment. In the PostScript Language Reference Manual, pages 278-279 (copyright 1985, Adobe Systems, Inc., Addison-Wesley Publishing Co., ISBN 0-201-10174-2): "Certain character codes serve special purposes, such as control-D to mark end-of-file. The server performs a job by reading and executing a PostScript program from the serial channel. When it reads the end-of-file character and the program terminates, the server sends an end-of-file character, ends the job, and starts a new one."

The LaserWriter's timeout and job flush message are generated in response to the CONTROL-G from the spooler. The LaserWriter's PostScript command interpreter does not understand the CONTROL-G and generates an error. The spooler does not know the printer is in a timeout/flush mode and continues to send data to the printer. Error messages from the LaserWriter are generated spontaneously and are directed to the standard output file and cannot be suppressed.

Note: The customer may want to consider using DTR for the handshake, eliminating the need for two-way communications with the LaserWriter. This way, the spooler can neither confuse nor be confused with extra control characters. To use DTR on the LaserWriter, the ROMs in the LaserWriter must be revision 2.0.

LaserWriter IINTX-J Printing Problems

Article Change History:

09/29/92 - REVIEWED
* For technical accuracy.

I'm having printing problems with a Kanji LaserWriter. I need to print both Japanese and English documents on the same LaserWriter IINTX-J. Can you answer these questions?

1) LaserWriter 5.2 works, but very slowly. In fact, a page in Osaka prints faster on a LaserWriter IINTX (bitmapped output) than on a LaserWriter IINTX-J.

2) LaserWriter 5.3 works OK in Kanji on the LaserWriter IINTX-J but does not support printing in Roman characters. We cannot print a page of plain text in Times or Helvetica. Can you explain?

3) Does Apple have a Kanji PrintMonitor/Laser Prep/LaserWriter 6.0 Driver?

This article has been archived and is no longer updated by Apple.
1) This is an interesting problem and will be obvious once explained. There are variables that need confirmation and reconciliation, however.

Osaka is a bitmapped font and has no PostScript equivalent; therefore, the optimal print times will be the same if everything is equal (actually, a bitmap print job is a little faster on a LaserWriter IINTX-J because the printer ROM version is newer, and the LaserWriter IINTX-J is usually configured with more RAM than a stock LaserWriter IINTX).

In your case, print jobs are probably slower on the LaserWriter IINTX-J because Font Substitution is most likely selected, causing the driver to perform additional searching (it attempts to locate and use a "double-wide" Kanji font on the printer) prior to printing. (The question to ask that will help verify the problem is whether both outputs are bitmapped, or if the LaserWriter IINTX-J substitutes a built-in PostScript font.) If it is printing a bitmapped font, even though Font Substitution is selected, the wrong version of "Kanji" fonts are being used or the font is damaged. We recommend that you always install the version of "Kanji" fonts that comes with the drivers and OS, and don't mix and match older fonts with newer drivers, for instance.

(NOTE: The above suggested workarounds are, of course, negated if you are using a program like MacPaint, which outputs a bitmap. This answer assumes that you are using a word processing or other type of application.)

2) This is very peculiar, and should work! We suspect the wrong versions of fonts are being used with the wrong version of driver. Less likely is that the application, drivers, or OS is damaged. Again, it is best to replace old Kanji fonts with the new ones that accompany the drivers and OS when updating the drivers. To investigate this further, we would need more details. Eventually, you may want to upgrade the account to the latest version of the driver, when you obtain it.

3) You can obtain the J1-5.3 driver from the Technical Support Information Source CD on the Utilities 2 disk.

Performance Tips

- For optimal appearance of the output and throughput, you might want to use a

built-in PostScript Kanji font, Gothic or Saimin, particularly if you are doing any scaling.

- If you are using both Kanji and Roman fonts in your document, for optimal printing speed, don't use a font menu to select between the fonts. Instead, use the Roman fonts built in to the Kanji font. You can change back and forth between the Kanji characters and Roman characters, say in Kyoto, by pressing Command-space. This minimizes the number of font bitmaps the printer must build when printing a job, which can decrease the amount of timerequired to print.

Claris CAD: StyleWriter Prints at Incorrect Scale

When I print to the StyleWriter from Claris CAD 2.0vX it prints at the wrong scale/size. What is wrong?

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.

This a known problem with Claris CAD and the StyleWriter Driver, particularly if the drawing size of a document is greater than 91.01", horizontally or vertically. If you go to "Drawing..." in the "Layout" menu and change the height and width of your drawing size to 91.01" or below, the StyleWriter will print the proper scale. If you can't modify the drawing size then go to the Layout Menu, choose Preferences..., select the Printer icon, and choose "More options, less resolution".

Note: This problem may be fixed with the StyleWriter 7.2.2 and the StyleWriter II drivers.

MacDraw II: Lines on Screen or Cannot Address Million of Colors

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.

MacDraw II (any version) will not run when the Monitors Control Panel is set to thousands or millions of colors. On most Macintosh computers, if you try to run MacDraw II more than 256 colors, you'll see a "Not enough memory" alert. With an Apple 8¥24 video board, the application will launch, but the document window displays a series of lines on the screen.

On the Power Macintosh, if you try to launch MacDraw II with more than 256 colors, you may get a Type 11 error. For both of these problems, the fix is to assign more memory to MacDraw II and to set the monitor colors to 256 or less.

MacDraw Pro: Can‘t Drag or Smooth Bezigon Near Drawing Edge

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.

Can't drag a bezigon close to the edge of the drawing, or the computer beeps attempting to smooth a bezigon or polygon which is close to the edge of the drawing.

Drag the polygon/bezigon away from the edge of the drawing.

The bounding box of a bezigon or smoothed polygon is larger than a regular polygon. (The bounding box is an invisible rectangle that defines the outer boundaries of all objects. When you select an object, the four resize handles that appear are at the corners of the bounding box.)

Draw a polygon, and notice that the four resize handles are very close to the visible boundary of the polygon. Draw a bezigon with control handles that extend away from the bezigon and notice that the four resize handles are much farther away from the visible boundary of the bezigon. This is because the bounding box that defines the bezigon includes the positions of the control handles. (Select the bezigon, then choose Reshape, then choose Select All to see all the control handles of the bezigon. Notice that the reshape handles just enclose the entire bezigon and the control handles.)

This means that a bezigon might not be able to be placed close to the edge of the drawing, as this would cause the control handles at the corners of the bounding box to be off the drawing. Also, if a polygon or bezigon is placed as close as possible to the drawing edge, you may not be able to smooth the polygon/bezigon. Smoothing causes the bounding box to increase.

{See the graphic for an example. Note, this graphic has been 'faked' to show simultaneously the control handles and the resize handles of the bezigon}

MacDraw II: Text Cut-off

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.

Subject:
Printing a document where the text gets cut-off in the (screen or printout) right hand side and/or the wrap arounds on the text for that text block doesn't match what shows on the screen (not WYSIWYG).

Solution:
Find out if there are any type of extra large LaserWriter fonts installed for that particular font face like 32, 48, 56, 72. If this large font sizes are installed, the text will not print properly, even when the sizes used are the standard font sizes like 10, 12, 14, etc. It seems that the font address table gets corrupted. The fonts need to be completely removed, meaning all font sizes, a new system re-installed, before you can print the form without the text cropped off. The font will still print because it is in the printer.

The situation here is that you then don't have that font available for a new document.

Using Suitcase doesn't solve the situation. Once you Open the file in Suitcase and try to address it the situation still persists and Closing the large font file doesn't clear it.

This large LaserWriter font file, LaserWriter LSF, is being distributed by Autographix for the users of their services.

MacDraw Pro: Certain Print Options Are Grayed Out

When printing to QuickDraw printers, certain printing options such as reduced printing and print quality options may be grayed out.
This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
To make those print quality options available in MacDraw Pro, select the Preferences command. Select the Printing preferences icon. Deselect (uncheck) the option for "Maximum Resolution." You will now have all printing options selectable.

In order to use the maximum printing resolution (instead of the default resolution, which may be lower) of the printer, certain options have to be disabled.

These options include reduced printing, and may also include print quality options, such as the Faster mode on the ImageWriter. MacDraw Pro is preset to use the Maximum Resolution setting, as the highest possible print quality is usually more reliable for accurate printouts. This means that the user must turn off the Maximum Resolution option to gain access to the disabled printer options.

ClarisDraw is not able to print using the Faster mode on the ImageWriter. "Draft" printing is available, but this is for text only--and even then, the result will be so poor as to be almost useless. The only workaround is to save as PICT and open the document in an application that supports both PICT and printing in "Faster" mode to an ImageWriter (such as ClarisWorks or MacDraw II)

System 6.0.4: Problem with Two-Floppy Macintosh SE and AFE

When trying to run Apple File Exchange on a Macintosh SE configured with two Apple SuperDrives (formerly Apple FDHD), running under System v6.0.4, I get an "ID=02" bomb. I also experienced the problem when starting up from the v6.0.3 System Tools disk; however, when I started up with a startup disk created from the System v6.0.3 Installer, I could get AFE to run.

I have tried several combinations of drives. The bomb occurs any time a SuperDrive is plugged into the drive slot marked "Upper" on the main logic board. Apparently the same problem occurs when starting from an external hard disk (until the upper drive is disconnected).

What's going on?

This article has been archived and is no longer updated by Apple.
This is a little-known incompatibility with dual-floppy Macintosh SEs, those having either SuperDrives or 800K drives. As of April, 1990, there is no fix available for system software v6.0.4.

If you need to get the configuration working, however, one of the following workarounds may do the trick:

- Disconnect one of the floppies and connect an internal or external hard disk.

- Configure a disk using earlier versions of AFE (say 1.1.1 with system software 6.0.3) as you described above.

MacDraw Pro: Importing Text into Slides

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
When the "Put each page break on a new layer" option is enabled in the Preferences Text to Graphics translator, each page in the text file is imported into a separate slide/layer.

The translator only recognizes "hard" page breaks in the text document. That is, page breaks that are manually entered with the Insert Page Break command (or equivalent).

This option is most useful for bringing multiple pages into separate slides and affects all text translators, including the MacWrite II and Word translators.

If multiple pages of a text document are imported into one layer, that means the document has "soft page breaks." Soft page breaks, page breaks that occur due to normal pagination by the word processor, are not recognized.

Re-open the text document in the word processor, then manually enter the page breaks at the desired positions. Then, import the text file into MacDraw Pro again.

MacDraw Pro: Notes Don‘t Print On Handouts

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
Notes (objects created with the Note tool) do not print on handouts.

Notes don't print on handouts even if you select "Print Notes" and "Handouts Only" in the print dialog box. This is the intended way for MacDraw Pro to function.
Published Date: Feb 18, 2012

Claris Software: Objects Printing Reduced to the StyleWriter

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
***This is fixed with the StyleWriter driver version 7.2.2 ***

When printing to the StyleWriter, objects may print smaller than they should.

If the drawing size exceeds 91 inches, either horizontally or vertically, and Page Setup is set to 100% Scale, it will print reduced on the StyleWriter. Likewise, if the drawing size exceeds 18.2 inches and Page Setup is set to 20% scale, the drawing will print reduced. (18.2 inches Ö 0.2 equals an effective drawing size of 91 inches).

The behavior occurs with all versions of MacDraw II through 1.1v2, MacDraw Pro 1.0v1, and all versions of Claris CAD through 2.0v3. It occurs when printing using any version of the StyleWriter driver before version 7.2.2

MacDraw Pro: Slide Images Printing Very Small In Handouts

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.

When printing handouts, the entire drawing area of the slide is reduced, not just the area of the drawing with objects on it.

Therefore, if the drawing size is much larger than is needed to hold the objects, the reduced handout printout will be very small.

The solution is to reduce the Drawing size to the smallest size possible to hold the objects before printing handouts.

MacPlot: Using MacPlot 1.2v2 with System 7.0

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
The Compatibility Checker states that MacPlot 1.2v2 isn't fully compatible with System 7.0.

To install the MacPlot Driver under System 7.0:

1. Double click on the System Folder to open it and drag the MacPlot Driver into it. If you try to drag the driver onto the system folder without opening on it, the system will want to place the driver into the extensions folder.

Don't drag the driver onto the System Folder or it will be placed in the Extensions Folder and MacPlot Configure 1.2v2 won't be able to find it.

2. Choose the MacPlot Driver before running MacPlot Configure.

As always, if the MacPlot Driver isn't chosen, MacPlot Configure will present a dialog with a button labeled "Use Chooser". However, this button will not bring up the chooser under system 7.0 and will display an alert that says it is "Unable to run the Chooser". Choosing the driver first will avoid this.

3. Set Virtual Memory and 32-bit addressing off in the Memory Control Panel and re-boot (this is true also when using Mode32).

The MacPlot Driver version 1.2v2 will not work with either Virtual Memory or 32-bit Addressing.

If any of the above solutions are not viable for your use, you may purchase a different plotter driver. Other drivers are available from MicroSpot.

MacPlot 1.1: Plotting Color With System 7.0

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
Users report that using the older version of MacPlot (1988 &1989) under 7.0, only parts of a color drawing were printed. Plotter would start to plot, switch colors, and never return to original color to finish objects. This was corrected by installing version 1.2.

However, updating from one driver to the next causes problems. Here are some workarounds:
- Re-install the system software
- Install new version of MacPlot and configure it.
- Choose another driver (e.g. LaserWriter)
- Open drawing that was not plotting correctly, chose page setup. Click Ok.
- Choose MacPlot Driver, choose page setup.

MacDraw Pro: Superscript Style Different Than "Footnote" Style

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
The Superscript style used in MacDraw Pro functions correctly. That is, a superscripted character has its size unchanged while raising the text about one-half line space. This leaves the character size too large if what you want is to create things like footnotes.

Footnotes (as in MacWrite II) use a stylization called Superior. Superior-styled text is raised while the character size is reduced to about 2/3 the original point size. In doing so, the top of the superior-styled text is about even with the top of the surrounding text.

You can simulate Superior stylization by doing the following:

1) Select the character(s) to apply the style
2) Select Superscript in the Style menu
3) Select a character size that's about 2/3 the size of the original. For example, if the surrounding text is 12 point, make the selected character 8 point.

MacPlot: Roland Plotters

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
Both HP & Roland agree that Roland plotters emulate HPs very well. Therefore, in troubleshooting Roland plotters, we treat them as HP plotters. The paper size is the best guide for establishing a correspondence relationship between the two brands. The (0,0) below refers to the origin of the plotter's coordinate system.

To be specific, for:

* For 880A,885,980,980A,990 & DXY 1100,1200,1300 use HP 7475A or 7550A - (0,0) is at lower left.

* For DPX-2000, 2200, 3300, 3500 use HP 7580 or 7585 - (0,0) is Cartesian.

* For GRX-300, 300AR, 400, 400AR use HP 7580 or 7585 - (0,0) at center; number of pens is less in Roland models than in the HP models.

* For LTX-120 use HP 7475 or 7550A

* For LTX-320, 420 use HP 7580 or 7585

* For CAM 1,2,3 use HP 7580.

Note that Roland currently does not have a model featuring page advance with roll feeds, but when they do, our driver will treat it as an HP 7586.

If you have trouble communicating with a Roland plotter set it for 7 data bits, 1 stop bit and even parity. MacPlot doesn't have a setting for data bits (it always uses 7) so set it for 1 stop bit and even parity.

MacDraw Pro: Saving Colors & Patterns In Style Bar

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
Colors, patterns and gradients can be saved to separate files from the palettes. There is no way to save out items in the Style Bar to a separate storage file.

However, you have two options available to have the colored patterns to be used in other documents:

1. Save out a file with your favorite colors/patterns/gradients to a stationery file
2. Create an object, such as a rectangle, filled with each color/pattern/gradient combination, then add this object to a library. You can then copy the object containing the desired pattern to your main document, then use the eyedropper to pick up the pattern.

MacDraw Pro: Text Binding To Curved Path

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
MacDraw Pro 1.0v1 does not feature support for text binding to a curved path.

For this feature, you can use Adobe TypeAlign in conjunction with MacDraw Pro. Follow these steps:

Printing to a Postscript printer:
1) Create the text on a curve using TypeAlign
2) Save the text to an EPS file
3) Place the EPS file into the MacDraw Pro document.

To work successfully, the text MUST be saved as an EPS file from TypeAlign. Copying and pasting to MacDraw Pro will result in printouts to a Postscript printer that look like barcodes.

Printing to a QuickDraw printer:
1) Create the text on a curve using TypeAlign
2) Copy and paste the image into MacDraw Pro

MacDraw Pro: Gradients Don‘t Rotate or Flip

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.

Gradient fills do not rotate nor flip horizontally or vertically. Thus, when you rotate or flip a gradient-filled object, the gradient will be unchanged.

The gradient will appear as if it still has the same "light source" as the original. This may mean that oval or circular objects with gradients focused on their centers may have their gradients appear to be off center when flipped or rotated. You may need to create new gradients with different focus points to fill the rotated/flipped objects.

Claris CAD: How Can I Learn Claris CAD Quickly?

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
Here are some suggestions about learning Claris CAD or speeding up your drawing technique:

1) View the video tape. It offers an excellent overview of the program along with its key drawing concepts.

2) Go through the tutorial files. These offer good examples of common drawing techniques.

3) Use the Quick Reference Guide. Knowing the keyboard shortcuts can really speed up your drawing, especially if you are using a large monitor.

4) Go through all of the modifiers and drawing methods. There are many, and you will find that once you have a good grasp of how they work, even the most complicated drawing is relatively quick to produce.

Claris CAD: Repairing Corrupt or Damaged Documents

You can sometimes repair corrupt Claris CAD documents. These documents may not open and/or return an "out of memory" error message. Or you may not be able to edit the document, but instead receive the message "sorry, objects must remain within document boundaries". Generally, a corrupt document contains an object with a coordinate that attempts to place it outside of the drawing area of Claris CAD (the 100" X 100" area, not the page that your drawing is on).

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
Here are some common situations:

1) The file begins to open, but stops and returns an error number -36 or -39.

This means that the file is actually physically damaged on the disk, or the operating system cannot handle the file. The first test is to see if you can make a copy of the file. Try dragging the file's icon to another disk or select it and choose Duplicate under the File menu from the Finder. If it won't copy, then the file is damaged and you can probably only get it to open using a utility that repairs damaged files, like Symantec Utilities or Norton Utilities. If the file does copy, read the following paragraphs and follow those suggestions.

2) The file begins to open but it stops and you get an out or memory error.

The file probably has a corrupt object, or it may have damaged resources. Try opening a new Claris CAD file and using the Place file... command to insert the file into the new file. If the original file has damaged resources, this may allow you to save the drawing. You can also use ResEdit to copy new resources to the file.

If the file will not place into a new file, then there is probably a corrupt object in the document. Try using a translation utility (like the Claris Graphics Translator) to see if translating the file to and from another format will filter out the corrupt object.

3) The file opens, but every time that you click on the drawing or try to move something you get the "sorry, objects must remain within document boundaries" error message.

This is caused by having an object that has a coordinate off the drawing boundary. The program will give you this message every time that it thinks that it has to redraw or move the suspect object. There are several strategies for finding and removing the object:

1) Go under the Layout menu to Fit to Window. You will probably see several seemingly blank pages or handles (the little rectangles that surround an object) that don't seem to be attached to an object. See if clicking on one of the blank pages will show you some handles. If so, hit the delete (or backspace) key on your keyboard. If you don't see any handles, try to click-drag the arrow cursor around your drawing to select everything on it. Don't surround the blank pages. See if you can copy the items to a new file.

2) See if you can go to another layer and copy and paste that layer to a new document. Sometimes hiding the layer with the corrupt document will allow you to copy and paste the other layers to a new document.

3) Try using a translating utility like the Claris Graphics Translator to translate the file to and from another format.

Claris CAD: Shifting Polygons when Transporting Images

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.

Due to the difference between the way that different programs print PICT files, you may not get an accurate print out of a Claris CAD drawing if you print it from a word processor or page layout program. It will be most obvious if you have objects of different types lined up in a drawing. If your drawing is made up completely of lines, then you can avoid it by cutting and pasting and saving as PICT.

If you have different types of objects in your drawing, take the following steps:

1) Set divisions per inch to 72 in the Rulers dialog of the drawing. Draw with the Autogrid on.

2) Group the entire drawing before copying or saving as PICT.

MacDraw Pro ships with a filter that allows you to save as an EPSF file. This filter will also work with Claris CAD 2.0v3 or later and is available on request. This will solve the shifting polygon anomaly as long as the destination of the drawing is a program that will accept EPSF files.

Claris Software: Seiko ColorPoint PS14 Page Sizes

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
The Seiko ColorPoint PS14 is a high-end color Postscript LaserWriter. It can use the Apple LaserWriter drivers, but also provides its own modified versions of those drivers. What the modified drivers allow you to do is access much larger image areas than the Apple standard drivers.

Since the printer uses rolls of paper, the available image areas can be quite large. However, simply selecting a larger print area in the Page Setup dialog is not enough. The image area must ALSO be selected on the control panel of the printer itself, and the printer must be taken offline to do this. It actually is not too difficult, but is a necessary step. If you don't do this, the printer will use the last setting, or the default of A4 size paper (roughly US Letter equivalent). Currently the Seiko ColorPoint has shipping versions of modified System 6.0.1 drivers. Their System 7 driver is not currently available at this time (June 20, 1991), but should be soon.

One reported problem with pre-release versions of their System 7 driver is that if any option is selected in the LaserWriter Options section of the Page Setup dialog, then the driver becomes confused about the appropriate image area for the document, and crops the picture. Removing the checked options in the Options solves the situation.

Multi-User Relational DBMS for Both Macintosh and PC

Article Change History

1/15/93 - UPDATED
* Changed vendor name.

I need a set of database programs that run on both the Macintosh and PC and can use a common set of relational database files on a server (multi-user type).

I know that some Macintosh products can read and run dBASE, but do they work on a network?

This article has been archived and is no longer updated by Apple.
Omnis 5 from Blyth Software and FoxBASE+ (used with FoxBASE+/LAN) from Microsoft both allow data files to be shared in a combined PC and Macintosh network environment.

FoxBASE+ includes tools that allow simple entry/retrieval forms to be drawn, and these tools can generate the code to handle the simple forms. FoxBASE+ also can directly use dBASE code from Borland International's dBASE.

We are not aware of a multi-user relational database that works on both platforms on a network and does not use a programming language.

To locate a vendor's address and phone numbers, use the vendor's name as a search string.

MacDraw II, MacDraw Pro: Opening/Recovering Corrupted Files

An explanation of recovering MacDraw II and MacDraw Pro files

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.
First, eliminate other possible causes. Disable INITs, reinstall the application with INITs diabled, try opening a known good file, like one of the sample files, etc. If the behavior appears to be file specific, the following explains recovery possibilities and techniques.

What to do if you can get the file open.
If the computer crashes or displays a system error after you've successfully opened the file, it may be a corrupt object or layer. The solution is to eliminate it by trial and error. You might try hiding layer(s). If a corrupted layer is hidden, it is less likely to cause a system error. Once you have narrowed it down to a specific layer, try copying and pasting the objects to a new layer, then delete the corrupt layer. If this doesn't solve the situation, a group is corrupted. Try selecting all the objects on the layer and Ungrouping several times. If this doesn't solve the situation, an object may be corrupted. You'll have to determine the corrupted object by trial and error.

Note that if you've used a corrupted object or group in several files, which is common when using libraries, this may cause all these files to have difficulties. This can make it hard to determine if the behavior is file-related or application- or system-related.
Tip: You might also try saving out to PICT, then reopening the file. Note that this may cause some objects to be shifted or distorted, and objects on all layers will be placed on a single layer.

What to do if the file won't open.
Is the file recovered with file recovery software?
If a file is recovered or unerased using recovery software and it won't open, there is no way to repair the file. MacDraw files are complex binary files, unlike simple ASCII text files, for example. If the file is not recovered completely intact, there is no way to repair the file.

MacDraw II Layer Corruption Issue
There is a rare but known issue with MacDraw II files becoming corrupted. Specifically, the top layer can become corrupted. Opening these files in MacDraw II results in a "not enough memory" alert or a System error -39, even when there is plenty of memory available to open the file.

To recover these files, open them using MacDraw Pro. The MacDraw II XTND translator can detect and repair these files. The corrupt layer will be discarded. You can then save these files back as MacDraw II files. If the file is not openable by MacDraw Pro, then the corruption is due to some other issue and the file is not recoverable.

MacDraw Pro Layer Corruption Problem
MacDraw Pro files may also, in rare cases, exhibit the same layer corruption behavior as MacDraw II files described previously. However, there is no simple way to recover these files. In some cases, we have been able to recover these files.

Other Issues
A MacDraw II file may have other forms of corruption not known or directly attributable to MacDraw. Opening the file may result in a -36, -39, or -108 System error. The file may have a damaged resource fork and may be salvageable.

To recover the file, open the file with ResEdit. Delete all the resources. Open a known good MacDraw II file. (Open a file from the same version of MacDraw as the corrupted file). Copy and paste all the resources from the good file into the corrupted file. Save the corrupted file. This file should then be openable. This objects in this file should then be copied (via clipboard or Place File) to a new empty file.

If the resource fork is extremely damaged, ResEdit may not be able to open the file. This makes things very difficult, since you need to open the file in ResEdit to delete the resources. In this case, open the file in SUM Tools. Select the resource fork. Set the EOF marker to zero. Save out the file. Then, open the corrupted file and copy and paste all the resources from another good file into the corrupted file. The file should then be openable. This objects in this file should then be copied (via clipboard or Place File) to a new empty file.

MacDraw Pro: Importing MacWrite II Documents

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
Two problems are known importing / Opening / Placing MacWrite II documents:

1) Dates that are formatted with the month name displayed first (e.g., Jun 25, 1989 or June 25, 1989) will open into MacDraw Pro with the day of the week inserted at the beginning of the date.

2) The line spacing of text may not exactly match that of the same text in MacWrite II, even though the line spacing indicator shows the same value. The spacing difference varies with the font and size. For example, the following is single line spacing:

Font MacDraw Pro MacWrite II
Times 12 13 point 12 pt.
Times 24 26 point 21 pt.

MacDraw Pro: Shape Burst Gradient in Arc

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
The following will recreate the behavior.

1. Create a shape burst gradient with the focal point at the extreme lower left corner and the minimum size.
2. Draw a 90 degree arc with the radius at the lower left corner.
3. Fill the arc with the gradient

The gradient will not correctly fill the arc. The arc will have both dark and light bands extending from the focal point, as if it were a shape burst/circular hybrid.

Claris Software: XTND Translators Not Listed

You can't open a file that requires the XTND translators. This can occur in any Claris application that uses the XTND translators, including MacDraw Pro, MacWrite II and MacWrite Pro, FileMaker Pro, Claris CAD and ClarisWorks. Symptoms of this issue:

1. When using the "Open", "Insert", "Place File" or "Import Picture" commands in the File menu, you see an alert that says "XTND Translators Not Available" or "File not Found".
2. The translators are not listed in the popup menu. That is, you click on the "Show All Available" popup and the XTND translators are not listed (which may include MacDraw II, MacWrite II, TIFF, EPSF, etc.). or you receive a message like "XTND Translators Not Available" or "File not Found". The file you're trying to convert probably is not listed in the scroll bar inside the dialog box.
3. The application may hang or display a system error message.

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.

Solutions:
Following is a list of solutions, in order of most common to least common. Try the solutions one at a time, restarting the application after each solution to see if the issue is fixed. If the behavior persists, quit the application, and try the next solution.

* Quit the application if it's running. Look for files called "XTND Translator List" and "Claris XTND Preferences." If you're using System 7, these files are in the Preferences folder, which is inside the System Folder. If you're using System 6, these files are in the Claris folder, which is inside the System Folder. If either or both of these files are present, trash them.
Note: ClarisWorks Office 5.0 deletes this file as part of the installation process. The file is then rebuilt when you launch ClarisWorks. However, if you have subsequently installed additional translators, such as MacLink Plus, included with OS 8, and the behavior occurs, try trashing this file.

* Verify that the translator files are installed properly. If you have installed the application using the installer program, you should see that these files have been installed correctly. You should see a folder inside the System Folder named "Claris". Inside the Claris folder, you should see a file called "Claris XTND System" and a folder called "Claris Translators". (Notes: if you're using MacWrite II, you won't have a Claris XTND System file. If you're using ClarisWorks 1.0, you should see an additional file inside the Claris folder called "ClarisWorks Translators" in the Claris folder). If any of these files are not present, run the Installer. Do a regular (not a Custom) install.

* Inside the System Folder, look for a duplicate copy of the Claris XTND System file. If found, trash it.

* A system extension or INIT may be conflicting with the Claris XTND System. If you have System 7, Restart your Macintosh and hold down the shift key until you see the message "Extensions off." If you have System 6, create a new folder on your hard drive, drag System, Finder and the Claris folder into it, and Restart your computer. To solve the situation, you'll have to try one INIT or Extension at a time, by trial and error.

*Create a new folder on your hard drive at the same level as the System Folder (in the hard drive window). Move everything from the real System Folder (EXCEPT Preferences Folder) to Untitled Folder and restart your computer. If this solves the situation, then move any required preferences files (QuickMail, etc) from the old System Folder's Preferences Folder into the new Untitled Folder's Preferences Folder. Note: you will not be able to copy the Finder Preferences. Throw away the old System Folder and old Preferences Folder; then change the name of the Untitled Folder to "System Folder."

* This is an alternative to the previous method of moving everything but Preferences into another folder. In the Finder, go to your main (top level) hard drive window. Create a new folder, which will be titled "untitled folder" or "empty folder". Open your System Folder. Drag these items into the untitled folder: Finder, System, any System Enablers and the Claris folder. Restart the computer. Run your Claris application and attempt to translate a file. If successful, quit the application. Open the untitled folder, then drag the Finder, System, any System Enablers and the Claris folder back into the original System Folder. Also, in the untitled folder, you'll see a newly created Preferences folder. Open it. You'll see a file called XTND Translator List. Drag this file into the Preferences folder inside your original System Folder. Restart the computer, then trash the untitled folder. Note: if these steps solve the situation, there may be an issue with the Desktop and/or directory files on your ha
rd drive. Rebuild the desktop by holding down the command and option keys while restarting the computer. Install System Update 3.0, a system updater from Apple available from the usual sources for Apple system software. Then run Disk First Aid and/or Norton Disk Doctor. Disk First Aid is included on the System Update 3.0 disk. Instructions are included in your computer's owners manual.

* If XTND filters have been added to the Claris Translators folder while MacDraw Pro or MacWrite Pro is running, those new filters will not be listed in the pop-up menus in the Open, Insert, Place or Save dialog boxes. To list these newly added filters, select the Translators icon in Preferences, then click on the Update XTND List button.

* Under System 7, versions of Adobe Type Reunion earlier than 1.0.2 will cause the XTND translators to not appear in preferences.

* MacWrite Pro Only:
If you install MacWrite Pro 1.0v2 or earlier to a drive that is not the startup drive, such as an external hard drive or a server volume, the XTND translators will not function. Even if the files are all installed in the correct location in the application folder (not in a System Folder on the non-startup drive), the translators will not function. The solution is to update to MacWrite Pro 1.0v4 or later. A workaround is to copy the XTND files

to your computer's Claris folder, inside the System Folder.

Claris CAD: Moving Objects With Precision

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.

Q. I want to move an object or a group of objects precisely. I want to move a circle's center to the end point of a line. Is there a quick method of moving objects that will move them all in one step?

A. Yes, there is. Claris CAD 2.0 added this feature. Please follow the directions below.

1. This procedure is easier if you use the graphics guide. First, choose a modifier to help select the point you want the object moved to. Next, click and drag from the ruler number box (the small number in the upper left of the window, where the rulers meet) and move the zero, zero location to the final place that you want the objects to be positioned. For example, if you want to move the center of a circle to the end point of a line, select the End-Point modifier then move the zero, zero location to that endpoint.

2. Select object(s) that you would like to move.

Note: Claris CAD uses it's reference point to relocate the items. The "Reference Point" is also the last point that you clicked on the screen. If you hold down the Option Key and the Command Key at the same time you can see the "Reference Point." It is graphically shown as a circle with a plus on top of it.

3. With the object(s) still selected choose a modifier, hold down the Command-Key and click on the point that you want to move the information from.

For example, if you want to move the center of a circle to the end point of a line. Select the Circle modifier & Command-Click on the center of the circle.

4. Type in the following:

The key marked "\\"
Type an "x"
Type "0" - Note this should be the number zero.
Hit the Tab Key
Type "0" - Note this should be the number zero.
Hit the Enter Key - This key is located on the right side of your keyboard by the keypad

Practice using different modifiers and different object types and groups. With a little practice with this technique you can move a point on any object or group of objects to any other location on the screen.

Claris CAD: Cannot Decrease Drawing Size

I have added some objects to my drawing and Claris CAD expands the Drawing Size larger even though my object does not extend to another page. What is happening?

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.

Even though your object(s) are located on the other pages that have been expanded, Claris CAD enlarges the "Drawing Size" based on the "Handles" of object. A problem that you may see is that an arc with it's center will extend to the right or left of the current page. The handles of the Arc that extend off the page will increase the "Drawing Size."

If you have deleted or moved the objects and there are sill empty pages, you can delete them by selecting Drawing... under the Layout menu. There will be a large square on the right of the dialog that shows the current drawing size. Clicking in the upper left hand corner of the square resizes the drawing area so that it only accomodates objects and handles that are actually on the drawing.

There is one anomaly that we are aware of in Claris CAD 2.0 that will still not allow you decrease the drawing size of your document, even if you do not have any Arcs on your drawing.

If you have selected objects that are on different layers and dragged them to a different location on the same page and typed Command-D (for Duplicate) as you were still dragging these objects, you may not be able to resize the drawing size. If you do an undo right after you see this happening you will be able to decrease the drawing size. If you have done any other drawing function in Claris CAD you will not be able to recreate the drawing size of the document.

MacDraw Pro: Can‘t Install by Clicking On Installer Script

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
This is fixed in MacDraw Pro 1.5

Double-clicking on the Installer Script file will NOT launch the Installer program, even though they both have the same creator type. The solution is to double-click on the Installer application. The installation instructions for MacDraw Pro state that you must click on the Installer file, not the Installer Script file.

Apple IIGS: Choosing Networked ImageWriter

I have two networks at two different schools. The first network has approximately 30 Apple IIGS systems, one Macintosh SE (acting as an AppleShare File Server), a Macintosh SE with HD20 SC, and four ImageWriter II printers with LocalTalk Option Cards. The network is connected with PhoneNET cabling and the machines are placed in no particular order around the network.

When the last LocalTalk ImageWriter II is added to end of the network, the LocalTalk ImageWriter II printers drop from the Chooser and become invisible to the Apple IIGS systems. The Macintosh SE can still see and print to the ImageWriters, however. If the LocalTalk ImageWriter II is moved to another location on the network with PhoneNET cable and connector box and another LocalTalk ImageWriter II is put in its place, the same thing happens. If the ImageWriter II is removed from the network, the Apple IIGS systems can see the other printers.

The second network uses a StarController and PhoneNET. One channel of the StarController has a Macintosh SE/30 AppleShare File Server; the second channel has 12 Apple IIGS systems, one Macintosh SE, and one LocalTalk ImageWriter II; the third channel has 15 Macintosh SE systems and three LocalTalk ImageWriter II printers. At some point, when enough machines are added, the same thing as above happens -- that is, the Apple IIGS systems can't see the ImageWriters, but the Macintosh systems can.

I ran Inter-Poll on one of these networks after the failure occurred. All Apple IIGS systems and all ImageWriter II printers were visible.

Note that in both cases the Apple IIGS systems start up from the network. What might cause this? Can you recommend any steps to cure this problem?

This article has been archived and is no longer updated by Apple.
NOTE: We are assuming that when you speak of using the Chooser, you're talking about the network ImageWriter CDEV found in the GS/OS Control Panel.

The GS/OS Control Panel network ImageWriter CDEV cannot handle more than three networked ImageWriters. When the fourth ImageWriter is added to the network, all networked ImageWriters disappear. There is no way to change the CDEV's performance.

When using GS/OS applications, the only workaround is to switch off ImageWriters until only three are active on the network; make the printer selection via the CDEV; then power on the remaining printers. Once the selection process is complete the printing process will work properly. Even though the CDEV cannot locate a printer, the GS/OS Print Manager can.

When using ProDOS 8 applications, using Chooser.II allows all available network ImageWriters to appear. Using Chooser.II does not work with GS/OS applications because Chooser.II stores its choices in the ATINIT file associated with that user. GS/OS applications look to the CDEV choices for printing operations.

In summary:

- For ProDOS applications, use Chooser.II.

- For GS/OS applications, use the Control Panel's network ImageWriter CDEV.

When using GS/OS with more than three ImageWriters on the network, perform printer choices when only three ImageWriters are powered on. Once chosen, all printers can be powered on and used normally.

Other than these workarounds, as of April, 1990, there is no solutio to the GS/OS Control Panel CDEV problem.

MacDraw Pro: Installer Doesn‘t Work With A/UX

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.

The Installer does not install MacDraw Pro properly while using A/UX.

Published Date: Feb 18, 2012

MacDraw Pro: Items in Palette‘s Menus Dimmed

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
If the commands in the Palette's menus (File, etc.) are dimmed, the palette's editor window is probably open.

Therefore, commands such as New Palette and Open Palette are not selectable.

The editor window opens automatically when you select the Colors..., Patterns... or Gradients... commands from the Layout menu. Closing the editor window also closes the Palette window. If you select these commands from the Layout menu, you won't be able to access the pulldown menus within the palettes.

To access these commands, you must tear off the palette from the icon.

Claris CAD 2.0v2: Read Me

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
This release includes several important changes to Claris CAD, which are described below.

1) Improved import of Claris CAD 1.0 files
* Attempting to open certain Claris CAD 1.0 files in Claris CAD 2.0 would inappropriately generate the alert - Sorry, there is not enough memory available to open "xxxxx". This was due to an invalid value saved with the document. These files can now be opened in Claris CAD 2.0v2.
* Claris CAD 1.0 rotated circular arcs are now properly converted when opened in Claris CAD 2.0v2.
* Files created in international versions of Claris CAD 1.0 and MacDraw II 1.1 will now import directly into U.S. or other international versions of Claris CAD 2.0v2.

2) Improved stability on Macintosh IIfx, IIci, SE, Plus, and Portable computers
* On a IIfx or IIci, using the Location bar in conjunction with the GuideLiner sometimes caused system errors. This has been corrected in Claris CAD 2.0v2.
* On a SE, Plus, or Portable, updating the Info window with multiple layers or editing a tolerance value in the Dimensions window caused a system error. This has been corrected in Claris CAD 2.0v2.

3) Updated files
* The Claris CAD font, contained in the GDT Font suitcase, and its associated ClarisCADFon PostScript font file have been updated to include +/-, * and O characters
* The latest version of the MacDraw II 1.1 XTND file filter has been included.
* The 8 Color Stationery file and the Berol RapiDesign sampler are now included on the Claris CAD Help disk.

4) Improved accuracy when using modifiers with the GuideLiner Preview feature turned off

5) Improved handling of symbol libraries
* Cutting, deleting, or ungrouping library objects could cause system errors, corrupt files, or inappropriate floater operation memory alerts. This has been corrected in Claris CAD 2.0v2

MacDraw Pro: Drop-launching Documents

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
With System 7.0, you can drag a document icon onto the creator application's icon, which will open the document into the application. This is called drop-launching

MacDraw Pro 1.5 will drop launch native files from MacDraw Pro 1.0/1.5 (document and palette files) and any file that will be opened using an XTND filter. PICT files from other applications and MacDraw 1.9 files will not drop launch.

MacDraw Pro 1.0 v1 will "drop-launch" only its own native files, even though it has translators to other type of files.

If files do not drop-launch correctly after installing MacDraw Pro 1.5, rebuild the desktop on the hard drive.
Published Date: Feb 18, 2012

Claris CAD: Objects Not Showing up on EPSF File

I have used the new EPSF filter for MacDraw Pro with Claris CAD 2.0 and although the picture looks fine in other applications some of the object do not get printed out. What could be happening?

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.

The filter that you are referring to was originally written to be used with MacDraw Pro. If you used Claris CAD 2.0v3 with Claris XTND System 1.2v2 most of these difficulties should disappear. If you are using 2.0v1 or 2.0v2 of Claris CAD some objects will not be saved out. If you are using 2.0v3 of Claris CAD you will need to unjoin Points and Walls for them to exported out correctly. At this time all type 3 fonts will not be exported out to the EPSF file. There is no work around at this time.

Note: It is important to realize that the GD&T (formerly called GDT) font and the ClarisCAD font will not be exported out because they are type 3 fonts.

Published Date: Feb 18, 2012

MacDraw Pro: PaintJet/PaintWriter Not Printing Color Patterns

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
MacDraw Pro 1.0/1.5 will not print color patterns to the PaintJet or PaintWriter from System 7.
Color patterns print as black and white patterns.

It WILL print color patterns correctly from System 6. This includes print driver versions current as of July 1991.

Patterns may print solid black to the HP PaintJet XL 300 color printer.

Hewlett Packard provides two drivers with the PaintJet XL 300. One is named "PaintJet XL 300" and is a QuickDraw driver. The other is named "PaintJet XL 300 PS" and is a PostScript driver. To print patterns correctly, you must use the QuickDraw driver.
Published Date: Feb 18, 2012

MacDraw Pro: Crashing/System Error Launching

MacDraw Pro 1.0v1/1.5 crashes with a system error (usually a bus error) when launched/opened.

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.
The following are steps to correct this:

* Turn off any INITs or Extensions (System 6: Drag the System and Finder to the Desktop; restart the computer; drag the System and Finder back into the System Folder. System 7: hold down the Shift key while restarting the computer). Launch MacDraw Pro to see if it is fixed.

* Check the root level of the hard disk (the desktop and the hard disk window) for a file called Claris XTND System. Also check the System Folder. If found in either location, trash it, then re-launch MacDraw Pro. (This could be an older version of the file from FileMaker Pro 1.0. The only copy of this file should be in the Claris folder, which is the version installed by MacDraw Pro).

* If the difficulty persists, reinstall the System Software and the MacDraw Pro application. Turn off all INITs before reinstalling MacDraw Pro.

* If the difficulty persists, rebuild the desktop (hold down the command and option keys while restarting the computer), then run Disk First Aid or Norton Disk Doctor. Disk First Aid is included on your System disks. Instructions are included in your computer's owners manual.

* If the difficulty persists, it could be a corrupted XTND preferences file. Delete XTND Translator List and Claris XTND Preferences, which reside in the Preferences folder in System 7.

* The software used to format the hard disk may be incompatible with System 7 and/or MacDraw Pro. Obtain a current version of this formatting software. For non-Apple brand drives, contact your dealer or hard drive vendor for the latest version of their formatting sofware. When obtained, you do NOT need to reformat the hard disk. Instead, you'll need to update the SCSI driver file on the hard drive. The way to do this varies from program to program, so you'll need to refer to instructions for your software on how to do this. (Usually there is a button or pull-down command worded something like "Update" or "Install Driver" or "Update SCSI driver").

One known incompatibility seems to be hard drives formatted with older versions of the Rodime hard drive formatting software. To fix this, launch a current version of the Rodime utilities software. There are two options for installing the SCSI driver file. Choose the one labeled something like "install standard driver," then install / update the driver file. MacDraw Pro should open successfully.

MacDraw Pro: Can‘t Replace Claris XTND System File

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
The Installer with MacDraw Pro 1.0v1 and 1.5 cannot replace/update the Claris XTND System file (v1.2) from FileMaker Pro. When attempting to install MacDraw Pro with v1.2 of this file present, a dialog box appears telling you that installation cannot take place. Here's what to do:

1. Quit the Installer.
2. Trash the Claris XTND System file currently on the hard disk (don't just drag it to the desktop).
3. Run the Installer again.

Published Date: Feb 18, 2012

MacDraw Pro: Installing Color Support Software

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
(MacDraw Pro 1.0) In the Installer, one Installation option is called Color Support Software. This option installs 32-Bit QuickDraw and LaserWriter 6.0.2 files.

If the Installer is launched with System 6, Color Support Software is listed to be installed when performing an Easy Install. However, if the Installer is launched with System 7, Color Support Software will NOT be listed to be installed using the Easy Install button. (This is appropriate, since these files are not required with System 7.)

If Color Support Software is selected using the Custom Install feature while running System 7, the Installer will install 32-Bit QuickDraw and the LaserWriter 6.0.2 files into the System Folder. These files are installed even though they are not appropriate for System 7. These files will not cause any problems if left there, but they are unnecessary additions to the System Folder. (The LaserWriter files are installed into the System Folder, not the Extensions folder.)

When using the Custom Install feature, the Installer installs all the files related to the chosen installation options, whether those files are appropriate or not. The Installer only checks system and CPU types (to modify what it will install) for use with Easy Install.

HyperCard: Don‘t Refer to Cards by ID in Non-Static Stacks

I'm working on a HyperCard application that makes extensive use of card ID numbers while also doing a lot of copying/cutting and pasting of cards for various reasons. The problem is that ID numbers occasionally change after cards are cut and/or pasted. As a result, functions that rely on the old ID numbers are upset.

Is there a way around this? When are card ID numbers changed; when are they not? Is there a way to force the ID number to remain the same or to change the ID number of an existing card?

My current solution is to check the ID number before and after copying, and if changed, laboriously replace all instances of the old ID number string with the new in all scripts (unsatisfactory, but better than nothing). In particular, I am working with two separate stacks, copying cards from one stack and placing them in another with the hope that the ID number will be the same on the new stack. There doesn't seem to be a pattern to when the ID number changes and when it doesn't.

This article has been archived and is no longer updated by Apple.
Referring to cards by their ID number is a great idea in static stacks. ID numbers are guaranteed to be unique, so the user can be sure no conflicts result. When working in a constantly changing stack, it's best to reference the card by name. When a card is created, we suggest that the user use something like:

```
set the name of this card to "C" & the ID of this card
```

to name the card. That way, names are reasonably unique (conflicts will be extremely rare) and cutting and pasting won't change the item referenced. The letter in quotes (in this case "C") can be any character, although it's safer to use letters. The purpose of the leading letter is to keep HyperCard from referencing card NUMBER "xxx" instead of card NAME "xxx".

MacDraw Pro: Using Custom Install

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
Attempting a Custom Install of the MacDraw Pro application (1.0v1) to a Mac SE (System 6, MultiFinder on), a dialog box sometimes appears saying that MacDraw Pro cannot be installed.

The dialog box appears at the end of the installation process, after the Installer disk has been reinserted. This has been observed on Mac SEs (with less than 4MB of RAM), but may occur with other models.

Install using single Finder, or increase the MultiFinder application memory size for the Installer application from 600K to 750K.
Published Date: Feb 18, 2012

MacDraw Pro: Printing Color/Grayscale Bitmaps

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.

To print colored or grayscale bitmaps correctly to a black and white Postscript printer, you need to print to a Postscript Level 2 printer (e.g., LaserWriter IIf, IIg, LaserWriter Pro) and use a Postscript Level 2 print driver (e.g., LaserWriter 8 driver). If you print using an earlier print driver or printer, the bitmap will print as black and white. The colored or grayscale pixels will not print dithered.

This includes:
1. Color screen shots or screen captures,
2. Black and white bitmaps from MacPaint, HyperCard (and similar programs) that are subsequently colorized in MacDraw Pro.

MacDraw Pro 1.0v1Compatible Hardware

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.

Verified Systems and Equipment

Hardware

* CPUs

1) Macintosh Portable
2) Macintosh Plus
3) Macintosh Classic
4) Macintosh SE
5) Macintosh SE/30
6) Macintosh II
7) Macintosh IIx
8) Macintosh IIcx
9) Macintosh IIci
10) Macintosh IIfx
11) Macintosh IIsi
12) Macintosh LC

MacDraw Pro does not run on a Macintosh 512KE or earlier. While it does run on a Portable, a Plus, and SE, and a Classic, these CPUs are not recommended. MacDraw Pro is not certified to run on an SE/30, a Macintosh II, IIx, or IIcx unless 32-bit QuickDraw 1.2 is installed.

* Peripherals

*** Disk drives

1) 800K internal disk drive
2) 800K external disk drive
3) HDFD internal disk drive
4) HD20SC external hard drive
5) 20 Mb internal hard drive
6) 40 Mb internal hard drive
7) 80 Mb internal hard drive
8) 120 Mb internal hard drive
9) 40 Mb PLI removable drive

An 800K disk drive is required for installing the application to a hard disk. The application cannot be run from an 800K floppy disk.

*** Monitors

1) Apple 9" display (Plus, SE, SE/30, and Classic)
2) Apple 12" color monitor
3) Apple 11" grayscale
4) Apple 13" RGB monitor
5) Apple Portrait monochrome monitor
6) Apple Two Page display grayscale monitor
7) Radius Full Page Display monitor
8) Radius Two Page Display monitor
9) Radius Two Page Display RGB monitor
10) Radius Pivot Display monitor
11) SuperMac 19" color monitor
12) SuperMac 19" monochrome monitor

While MacDraw Pro has been tested on all of the above monitors there are a number of known anomalies that are specific to several of the third party monitors.

*** Video display cards

MacDraw Pro 1.0v1: Read Me

The following is the contents of the Read Me file on the Program 1 Disk:
This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
Welcome.
This addendum is provided to communicate information and workarounds not available in printed documentation. You can also find important tips in the MacDraw Pro UserÕs Guide Troubleshooting section (Appendix A).

INSTALLATION NOTES
Please remember to remove all virus checking software from your system before installing MacDraw Pro software, and then to re-install your virus checking software afterward.
The installation process will leave some temporary files on your hard disk. These files are automatically removed by your Macintosh when you restart (if you need to recover disk space after installation, Restart your Macintosh).

FONT SUBSTITUTION
MacDraw Pro uses processes to place text as accurately as possible when printing. These processes are not compatible with Font Substitution in the LaserWriter Driver.
To ensure proper printing of high-resolution fonts, please use Helvetica, Times, and Courier instead of Geneva, New York, and Monaco.

MACDRAW II IMPORT
Improved text placement in MacDraw Pro may cause line breaks to change slightly within text blocks in imported MacDraw II files. This is due to letter spacing contracting (or in some cases expanding) slightly. Manually adjusting the letter spacing of words on a line above a new line break will return the line break to its original position.

To increase (decrease) character spacing for a word:
1. Select the text tool, and click on the text block.
2. Double-click the word to select it.
3. Hold down the option key and press the right (left) arrow key.

STYLEWRITER INFORMATION
The Apple StyleWriter printer uses the memory in your Macintosh to rotate blocks of text. Depending on available memory, large blocks of rotated text may not print. Try the following steps:
1. Break the text block into smaller parts, and delete extra carriage returns. The total amount of memory required to print rotated text varies in direct proportion to the total size of the text block, so smaller blocks need less memory.

2. Increase available memory. Instructions on increasing available memory may be found in Appendix A of the MacDraw Pro User's Guide.

ADOBE TYPE REUNION INFORMATION
Adobe Type Reunion substantially reduces the performance of MacDraw Pro for many interactive operations (such as selecting objects). You may experience significant performance gains by removing Type Reunion from your system folder and restarting your system before using MacDrawÊPro.
Additionally, an incompatibility exists with Type Reunion when saving files in MacDraw II format which can result in system instability. Please do not Save As MacDraw II with Type Reunion installed.

COMPLEX POLYGON OBJECTS
Complex polygon, bezigon, and freehand objects may not print in some cases. Please see the UserÕs Guide Troubleshooting section for information on approximate point guidelines, and tips on printing. Additionally, gradient fills may not appear in complex polygon objects.
Simplifying complex polygons will result in faster printing and faster screen display. To simplify these objects, use the Reshape command, select the object, and remove some points. Also, try to reduce points of overlap on an object (where lines on the object cross).

A/UX INSTALLATION
If you are installing under A/UX 2.0, you will be able to install the application using the Installer, but will need to install ancillary files manually (by dragging them from the disks). Please do not use the Easy Install feature. Instead:
1 Create a folder called "MacDraw Pro Folder" on the root directory of your A/UX volume. Then, install the MacDraw Pro application following the steps in the Installation Options section of Getting Started. (Essentially, create the "MacDraw Pro Folder" on your "/" volume, launch the installer, click the customize button, click the item titled ÒMacDraw Pro ApplicationÓ and press the Install button.)
2. Drag the other files you wish to have installed from the MacDraw Pro disk set to your hard disk. To ensure proper operation of spelling dictionaries, help, and the XTND file translation system, install your files as listed in ÒChecking the InstallationÓ in Getting Started. (Note: if you already have a "Claris" folder with spelling dictionaries installed, you do not need to update your dictionary files. If you already have a "Claris Translators" folder, drag the translators from your MacDraw Pro disk set into the existing folder.)

Claris Resolve: Creating a series of numbers

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
There are two methods to create a series of numbers in Claris Resolve:

Method 1:
Put the number 1 in cell A1. In cell A2 put the formula: =A1 + 1. Then select a column of cells starting with A2. Choose Fill Down from the Calculate menu. The formula will be copied all the way down and give you a series of consecutive numbers.

Method 2:
Select a range of cells. Do a 'Fill' command (or command-L). A consecutive series of numbers starting with '1' will be created. If you want the series to start with something other than 1, put that number in the first cell before selecting the range. If you put a number in the last cell of the range, the Fill command will give you a series of numbers that are segmented between the first and last cell.

Claris Resolve: Split Screens and Multiple Views

Does Claris Resolve have a 'split-screen' feature?

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
Claris Resolve handles the need for split screens in a more versatile manner than other spreadsheet programs. Claris Resolve allows you to open the same spreadsheet multiple times and set them as views. You can then toggle the views back and forth using the mouse or by selecting an item from the 'View' menu.

Multiple screens allow you to lock Title cells vertically in one screen and horizontally in another.

Multiple screens allow you to hide tools on one view and keep them visible in another.

Multiple screens allow up to 32 views open at the same time (under system 7; 16 views under system 6.x).

Note: Clicking on the Grow Icon zooms all views of that spreadsheet.
Published Date: Feb 18, 2012

Claris Resolve: Using Custom Numeric Formats

The customer forgets how they have designated a custom number format in Claris Resolve. How can the format be shown?
This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
To see how all the predefined formats are designated, go to the 'Numeric" and then 'Set Formats' menu (or command-J). Select the name of the format you wish to analyze from the 'Menu' side of the dialog box. The criteria for the chosen format will appear at the bottom of the screen above the OK button.
Published Date: Feb 18, 2012

Claris Resolve: Using Operator Feature with Paste Special

The 'Add' operator is used in the Paste Special command, but nothing happens.

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.

All of the operators within the Paste Special command apply on to values and not to formulas. If you copy a cell, you automatically copy the formula (if there is one -- the value if there isn't). It isn't logical to 'add' a formula to a formula, so Claris Resolve merely pastes in the original formula instead of adding in the value.

MacDraw Pro: AppleShare Print Server Error Message

Installing the LaserWriter 6.0.2 printer driver with the MacDraw Pro 1.0 Installer can create printing difficulty when printing using the AppleShare Print Server software.
This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
This occurs because the AppleShare Print Server software uses the Laser Prep file on the AppleShare server to initialize the LaserWriter printers, not the Laser Prep file on the user's computer. After installing MacDraw Pro, the Laser Prep file on the user's hard disk may be a later version than the Laser Prep on the AppleShare server (which may be version 5.2 or earlier). This will cause an "Incompatible version..." message when trying to print.

To print correctly using an AppleShare Print Server, you must update the Laser Prep file on the AppleShare server to be the same version as that on the user's hard disk. (System 7 disks include a Laser Prep file specifically for placement on the AppleShare server). Then reset the laser printer. Also, be sure that there is only one Laser Prep file in the AppleShare server's System Folder.

AFE: Problem May Be Faulty Cable or Missing SMB Server

I received this message when launching AFE to do SMB file transfer:

"The Token Ring interface driver could not be opened."

The Apple File Exchange then launches without file transfer capability.

I'm running a Macintosh IIcx with System 6.0.4, EtherTalk NB Card, video card, and TokenTalk NB Card.

Can you explain?

This article has been archived and is no longer updated by Apple.
This error message appears when there are problems with cable connections or when the SMB File Transfer Utility cannot find an SMB server on the ring.

Make sure that the cable is fully connected to the TokenTalk NB Card and the MAU, and ensure that the SMB file server is still running on that ring.

If that does not correct the problem, you might try a different TokenTalk NB Card, or try a different cable and connect it to a different port on the MAU.

MacDraw Pro: TrueType Used Before Bitmaps

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
In System 7, bitmaps have priority over TrueType for screen display.

MacDraw Pro 1.0v1, however, uses TrueType even if the bitmap is present. This is a specific design decision. Although text can take longer to display, the text placement is more accurate at all zoom levels and printer resolutions.

MacLinkPlus 8.10 / 9.0: Translator List

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.

MacLinkPlus Version 9.00 (current version)
Released in October 1996

New Translators
Corel WordPerfect 7 (Windows 95)
Corel Quattro Pro 7 (Windows 95)

Now Power Mac Native
Translations up to 4 times faster
68k Macs are also supported

New Word Processing Features
Automatic Bullets, Numbers & Multilevel Outlines
Hypertext Links and Bookmarks
Absolutely Positioned Objects (Text and Graphic Frames)

Updated HTML Translator
Supports Netscape 3.0 cache searching

MacDraw Pro: Text Insertion Point Misplaced

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.

When editing text at odd zoom levels (e.g., 344%), the cursor may appear placed incorrectly. That is, instead of being between letters, it may be over the middle of a letter or out of the text object entirely. To fix this problem, turn ON Kerning by Pairs in Preferences. This will space the text properly so it can be edited at zoom levels that are not an even multiple or fraction of 100%. Or, zoom back to 100% or some even multiple, such as 50% or 200%, to edit text.

This symptom can also occur when running the Mode 32 INIT with MacDraw Pro 1.0v1. Update to MacDraw Pro 1.5 to use with the Mode 32 INIT.

Claris Resolve: Calculations not Updating Correctly

I have a calculation based on the result of the 'Distribution' function. But when I update my distribution criteria, the calculation does not update. What is going wrong?

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.

Some calculations in Claris Resolve 1.X do not update automatically. Sometimes you can force an update by selecting 'Calculate Now' -- even though the 'Auto Calc' feature is turned on. Otherwise, you have to reenter the calculation to force the update.

Published Date: Feb 18, 2012

Claris Resolve: Inserting a Row

The 'Insert' command only moves cells over to the right -- not down.

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.

The 'Insert' command will only insert a row when you select the row heading on the far left side of the spreadsheet. Otherwise, 'insert' will only allow you to enter in blank columns or cells to the left of the selected cell. The only way to get a selected row of blank cells is to cut and paste.

MacDraw Pro: Installing on Systems 6.0 & LaserWriter 7.0 Machines

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
(MacDraw Pro 1.0) MacDraw Pro prints and works correctly with System 7 drivers, even on Macintosh that are running Sys 6.0.x.

When performing the standard installation, the Installer looks at the System to learn its version. When it sees a System 6.0.x machine with a LaserWriter 7 version, (actually it looks for any non LaserWriter 6.0.2 driver) it alerts that cannot replace it and recommends to remove the LaserWriter and LaserPrep before performing the installation. It will NOT continue the installation, and alerts you that it was not performed.

What they should do in a mixed environment network is to perform a Customized installation and select all the files in the Installer script to be installed EXCEPT the Color Support Software which installs then the LaserWriter 6.0.2 files. (Actually if they select a file within the Installer script window, it will explain "exactly" what it would do if they will select to install the Color Support Software.)

Then, they can install all MacDraw Pro files and still keep the LaserWriter and LaserPrep 7.0 untouched on those System 6.0.X machines.

Claris CAD: Version 2.0v3

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
What's been changed:

1. System 7.0 compatible
2. GDT is known as GD&T for legal reasons.
3. Characters have been added to ClarisCAD font
4. GD&T has been made Postscript and System 7.0 compatible
5. Black and white color stationery will be provided on request (see the record 'Documentation Errors - Stationery & Berol Rapid Design Sampler - Command Keys')
6. Resolution preferences now includeStyleWriter and LaserWriter LS options
7. EPSF XTND filter (objects saved out only) availble on request

Bugs fixed for System 7.0 (items that don't function with 7.0 and previous versions of ClarisÊCAD)
1. Objects are transferred from the Claris Cad clipboard tothe System's clipboard
2. Option-Shift-Z and Option-Shift-M (zoom in and out) works
3. GD&T font works
4. Gravity point redraw works correctly
5. PrintMonitor and open floaters bug (wouldn't print) fixed
6. Aliases work correctly
7. Chamfer single click method fixed
8. Info window bug fixed
9. Location bar/fractional readout bug fixed

Claris CAD: Create Wall and Door Openings

You can employ the wall tool creatively to create openings quickly and accurately.

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.

There two primary ways to approach placing windows and doors in Claris CAD. You can create opaquedoor or window objects to paste over the wall (saving them as library objects makes them readily available) or you can modify the wall itself using the Clean Up tool.

If the overlapping object is another wall segment, and you use the Clean Up tool, you can actually modify the wall itself, creating a permanent opening without destroying the integrity of the wall. (The use of the Clean Up tool is covered on pages 3 and 4 of the Claris CAD New Features Guide.)

For this example, you'll draw a horizontal wall 20' long (using 1/4" = 1 foot scale) and put a 33" opening in the center of the wall.

1) Draw a horizontal wall 20' in length.
2) Now draw a vertical wall. The length isn't important, as long as it completely intersects the first wall. Use the Width box of the Walls floating window to set the width of the vertical wall to 33".
3) Select the Clean Up tool. (Here is where we follow the instructions in the New Features Guide.) Use the lower left method, the 'overlapping intersection' method,' from the Clean Up floater.
4) Hold down the command key and click on the vertical wall.
5) Still holding down the command key, click the horizontal wall.

You will now have two horizontal walls with a 33' opening centered between them. While drawing the walls you can use the usual modifiers to position them.

You can use Claris CAD s "cleanup" feature to make quick work of doors and other wall openings. Here's how to do it:

1. Make sure the main wall, the one that will contain the door, is not selected.
2. Select the wall tool if it is not already selected.

The Walls palette will appear. (If it doesn't, choose Show Walls from the Layout menu.)

3. Set the width of the new wall to the size of the gap you need. The example in Figure 2 will create a 3-foot gap in the main wall.

4. Draw a "wall" perpendicular to the main wall, intersecting it as in Figure 2.

5. Choose Clean Up from the Edit menu. The Clean Up palette appears.

6. Select the over-under method from the Clean Up palette (bottom row, left).

7. Command-click the wall with the window/door width and then command-click the main wall.

You will now have the original wall broken with end caps, at the location and width of the second wall.

MacDraw Pro, Claris CAD: Long Dashed Lines in EPSF

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.

Long dashed lines with short dashes saved as EPSF from MacDraw Pro 1.0v1 or Claris CAD cause a Postscript error when printed. This is an issue with the EPSF XTND filter (version 1.0) available with MacDraw Pro 1.0v1 and Claris CAD 2.0v3.

Workaround: try using a line with longer (hence, fewer) dashes. Or, create two or three lines overlapping end-to-end, instead of a single line. (In Claris CAD, try using the cutting tool to cut the line into two or more segments.)

MacDraw Pro: Issues With Demo Version

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
The following issues have been confirmed with the demo version of MacDraw Pro 1.0v1:

-- With the Scrapbook in the application partition (option - selecting the Scrapbook in MultiFinder, or selecting the Scrapbook in single Finder), choosing Hide Clipboard twice will cause a crash.

-- Under MultiFinder (or System 7.0), if an object has been copied to the application clipboard, import into the application from the System clipboard is disabled.

MacDraw Pro: Issues with Network Version

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
The following are known issues with the network (concurrent use) version of MacDraw Pro 1.0v1:

-- When launched from a server, the application will crash when the user attempts to use it or quit after the server has been disconnected.

-- If a copy of the application is active anywhere on the network, the application cannot be copied from the server to a System 7.0 volume. It will be flagged as busy. The following are workarounds:
- Have all users quit the application from the server, then copy.
- Duplicate the application from the Finder, then copy the duplicate.

Claris CAD: Scanned or Bitmapped Pictures

I would like to scan images and paste them into Claris CAD. With these images in Claris CAD, I would like to:

1. Accurately dimension them (Claris CAD does not have a way to find specific points on bitmap)
2. Edit portions of them (Claris CAD does not have paint tools).
3. Delete portions of them (Claris CAD does not have paint tools).
4. Calculate out the amount of area being used by a specific portion of the bitmap (Claris CAD cannot define the different areas in bitmap).
5. Translate this bitmap to other platforms (The DXF & IGES formats do not support bitmaps).

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.
The above items are virtually impractical to do in Claris CAD, unless the person is willing to trace over these objects or use something like "Streamline by Adobe" to trace over simple line drawings.

You can dimension the distance between points on a bitmap if you use the point tool to place points on the bitmap and then dimension between the points.

Why do we allow customers to paste in Bitmaps into Claris CAD? You still can do a few things, for example rotate them, scale them and print them. Bitmaps are a Macintosh Graphics standard so for Claris CAD not to allow customers to do these things would not be a good decision on our part.

(A note on Streamline. A new version of "Adobe's Streamline" can save out DXF files, if the customer has a simple line drawing, for example, a scan of a house. They can trace it in Streamline. Save it as DXF. Translate it through CGT and work with it in Claris CAD.)

MacDraw Pro: Slow Printing to QuickDraw Printers

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
TIP: to print as fast as possible to QuickDraw printers (ImageWriter, DeskWriter, LaserWriter IISC, GCC PLP (General Computer Corporation Personal Laser Printer) and so forth), do the following:

1- Use MacDraw Pro 1.5, not 1.0v1
2- If using System 7, use Tuneup 1.1.1.
3- Turn OFF the "Maximum Printing Resolution" option in Preferences. However, note that rotated text will print very poorly with this option disabled.

MacDraw Pro: White Pen Objects Printing/Viewing Black

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
Objects from MacDraw Pro 1.0/1.5 created with a white pen, and saved as a MacDraw II file are printed and/or viewed as black from MacDraw II.

Reselect the objects in MacDraw II, then reset the pen color to white.

In MacDraw Pro 1.0v1, create an object and set the pen color to white. Save As the document to MacDraw II format. Open the file in MacDraw II.

The objects will have a black pen color on non-color Macs. The objects will appear to have a white pen color viewed on color Macs. The objects will print to a Postscript LaserWriter as black from either Mac.

MacDraw II: Lines per Inch

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
The MacDraw II configure program allows MacDraw II users to define how many Lines Per Inch (LPI) the hi-resolution printers will address per color. The default (preset) settings are 60 LPI for all colors.

Here are some guidelines of what is the "norm" in the industry according to Publish magazine.

Newspapers (low res) usually work with 85-100 LPI
Magazines usually work with 120-150 LPI
Publish Magazines uses 133 LPI
Advertising Materials usually work with 200 LPI or more.

Claris Resolve: Potential Issue with Monitor Extensions

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
In Claris Resolve, you have the ability to move one screen at a time with the command-arrow key combination. However, the RasterOps monitor extensions uses the command-right arrow and command-left arrow combination to zoom-out and zoom-in, respectively. Therefore, with such monitor extensions installed, the customer will get a surprise zoom when expecting to move one screen over.

The only resolution to this is to select the"Monitors" control panel device and click the "Options" button in the associated dialog box. From there you should be able to disable the zoom.

LaserWriter: Problem Printing Multiple Copies

I'm having a problem printing multiple copies of a document with a LaserWriter IINT through the AppleShare Printer Server. If the number of copies to print is greater than 6, the LaserWriter IINT doesn't stop when it reaches that number.

I increased the timeout delay on the printer (using SENDPS application) to send PostScript code to the printer, and installed LaserWriter Driver 6.0.1 and Laser Prep. Neither of these measures corrected the problem.

Can you help?
This article has been archived and is no longer updated by Apple.
This is a known problem with the LaserWriter family of printers that is particularly noticeable when printing to a LaserWriter via a LaserShare or an AppleShare Print Server. Macintosh Technical Note #123 describes the problem.

If a user prints more than 15 copies of a document, a timeout condition may occur, causing the print job to abort. With LaserShare or AppleShare Print Server, this problem can happen with as few as nine copies. This problem is a result of the LaserWriter not sending packets at the proper times to maintain the connection to the device sending the print job. Because of this, the connection times out after about 2 minutes. The AppleShare Print Server then sends the job to the LaserWriter again causing a duplicate set of printouts. This happens only when the LaserWriter is extremely busy.

The LaserWriter IINTX seems least affected by this problem.

As of April, 1990, we know of no solution.

The following Tech Info Library article can help you find the Tech Note mentioned here:

MacDraw Pro: Gradients on PostScript and QuickDraw Printers

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.

Postscript Printers (LaserWriter NT, etc.)
On screen, MacDraw Pro dithers gradients so that the transition between bands of color are almost undetectable. However, most 300 dpi Postscript printers are limited to about 32 levels of gray when printing and cannot print with perfectly smooth color/gray transitions. This is due to resolution limitations of 300 dpi printers. (Some 300dpi printers, such as the LaserWriter IIf and IIg, which utilize PhotoGrade technology, can print more gray levels). The solution is to print to a printer with higher resolution and increase the number of gradient printing steps in the Preferences/Printers window.
TIP: the gradient will print somewhat better as an EPSF image than as a MacDraw Pro object.

QuickDraw Printers (ImageWriter, LaserWriter SC, DeskWriter, etc.)
Many non-Postscript printers cannot print gradients with smooth color transitions. Instead, the gradients print with only a few (8 -12) steps, each step being a wide band without a smooth transition to the next step. Increasing the number of gradient steps in the Printing Preferences will have no effect on the print quality.

This is a limitation of the printer driver. It is not caused by MacDraw Pro. The print driver has to convert the colors in the gradient to gray levels. Each print driver has a limit to how many gray levels it can print. Print drivers that cannot print smooth gradients include all ImageWriters, the StyleWriter (original), the LaserWriter LS and the LaserWriter IISC. Note: some third-party print drivers (MacPalette II by Microspot; WonderPrint by Delta Tao) support dithered printing (smooth gradients) to these printers. All DeskWriters and the StyleWriter II can print fairly smooth gradients using printer drivers current as of 4/93. Tip: try increasing the number of gradient printing steps in the Preferences/Printers window.

Claris Resolve: Sending Apple Events from HyperCard 2.1

You can send Claris Resolve Script commands from HyperCard to Claris Resolve, but there is a limit to how many characters can be sent.

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
Note: It is recommended that you have the following versions of software: System 7.1.1 or System 7.5 or newer; AppleScript 1.1 or newer.

AppleScripting Level: Intermediate

You can send almost any Claris Resolve Script command from HyperCard 2.1 to Claris Resolve using Apple Events. Claris Resolve, however, has a 254 character limit for each "dosc" event (the event which HyperCard sends with the HyperTalk "Send" command.

You will generally receive a -1708 error as theResult of your Send command if you exceed this limit.

The following script will let you send scripts of any length from HyperCard to Claris Resolve in the most efficient manner possible. It sends as many lines as possible within the 254 character limit.

```
on mouseUp
put empty into scriptChunk
put 0 into counter
put 1 into i
repeat until i > the number of lines in field "Script"
add ( the number of chars in line i of field "Script" + 1 ) to counter
if counter > 254 then
send scriptChunk to program "Claris Resolve"
If the result is not empty then
answer the result
exit mouseUp
end if
put empty into scriptChunk
put 0 into counter
else
put ( line i of field "Script" & space ) after scriptChunk
add 1 to i
end if
end repeat
send scriptChunk to program "Claris Resolve"
answer "Your script is complete!"
end mouseUp
```

Where:
* Field "Script" is a field containing the Claris Resolve script you wish to send (you may need to specify it as a card field if it is not a background field).
* It is assumed in this example that Claris Resolve is already running on the same machine.
* Modifications to this script are required if you wish it to launch Claris Resolve or if it resides on a different machine. In the second case, you need to specify the full network pathname of the application.
* This method does not allow for logical structures such as For loops or IF statements. Logical structures must be sent in one complete chunk or errors will occur.

You can also create a simple loop that sends the commands one line at a time. This method, however, will be slower - especially when sending Apple events across a network.

Claris Resolve: Hide Utility Causes Crashes

There is a bug in Claris Resolve 1.0v2 in the Hide Utility. It has been corrected in Claris Resolve 1.0v3.

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.
In Claris Resolve 1.0v2 there is an issue with the Hide command under the Utilities menu. Here are the steps necessary to reproduce it:

1. The Cell must contain text (not numbers)
2. The Cell must be right aligned
3. The column which contains the cell is collapsed to just 1 pixel wide.

If the first two cases are true for any cell in the column, Claris Resolve will hang when the column is collapsed to just 1 pixel wide. This only happens in the 1 pixel case. 2 pixels or 0 pixels works fine.

The Claris Resolve Demo files use quite a bit of right aligned text, so the behavior is commonly reported by operators of this demo. It will also occur on a new worksheet, however, if the correct conditions exist.

This was corrected in Claris Resolve 1.0v3.

Claris Resolve: Selecting Polylines--Documentation Error

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
Selecting Polylines - Documentation / Publications Error

Page 5-23 of the Claris Resolve Users Guide (U91-600-001A) states "To select a polyline, click the line rather than inside the area bounded by the line. A polyline is a line, not a closed object."

This seems to be a mistake as you can click inside a polyline to select it. It appears that even though a polyline is a line, it still needs a bounding rectangle to define it. Therefore, selecting within the polyline keeps the click within its bounding rectangle and thus selects the object.
Published Date: Feb 18, 2012

AppleShare Print Server: Problems Using with Macintosh IIfx

There are some bugs in the AppleShare Print Server that only show up when the print server is run on a Macintosh IIfx machine. The bugs will be fixed in the AppleShare Print Server software in a future release that will ship subsequently to the release of the Macintosh IIfx machine.

NOTE: These bugs only occur under heavy load, for example when the server has captured 3-4 printers and all those printers are in use.

The bugs and the recovery mechanisms are described below:

This article has been archived and is no longer updated by Apple.

Bug: While the spooler is running under heavy load, sometimes it puts up adialog box with an error message saying something like "A fatal error happened so the print server attempted to clean up before releasing the printer. Error code -1104" or -91". When you click OK, the spooler closes the connection with the affected printer (stops spooling for that printer). Spooling on other captured printers goes on as usual.

Recovery: Re-capture the printer you just lost. Things should return to normal at that point.

Bug: While the spooler is running under heavy load, if you try to capture and release printers several times, sometimes the spooler crashes (with bus error) while trying to release a printer.

Recovery: Reboot the machine and restart the spooler.

MacDraw II, Claris CAD: Window Size Cannot Be Changed

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.

After launching Claris CAD or MacDraw II on a small start-up monitor and moving the window to a larger monitor, the window on the larger screen cannot be resized.

Both Claris CAD and MacDraw II set your window size to the size of your start-up monitor. The window size is set at this point and CANNOT become any larger. A work around would be to change your start-up monitor to the larger monitor and then launch Claris CAD or MacDraw II.

Published Date: Feb 18, 2012

MacDraw Pro: Changing Background Color of Patterns

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
MacDraw Pro 1.0 does not allow the background color of a pattern to be changed to non-white. All patterns must have a white background color.

MacDraw Pro 1.5 does allow the background color of a pattern to be edited to be non-white. To print color patterns directly to a Postscript printer, you need a Postscript Level 2 print driver (e.g., LaserWriter 8 driver) and a Level 2 printer (e.g., IIf, IIg, LaserWriter Pro). To print color patterns with an older printer driver or printer, save to an EPSF file, open or import the EPSF file, then print. If saving to an EPSF file, you must use the EPSF XTND translator included with MacDraw Pro 1.5v2.

MacDraw Pro: Changing Background of Scanned Image to Transparent

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
MacDraw Pro 1.0 / 1.5v1 does not support changing the white pixels of a bitmap, such as a scanned image, from white to transparent. Thus, placing a scanned image over another object will mask out the other object, rather than seeing through the "blank" areas of the scan to the object beneath. There are two workarounds to this problem. The following information applies to black and white (line art) bitmaps. Color/grayscale scans cannot be made to have transparent pixels.

Workaround #1
Resave the scanned image in another file format. For example, the AppleScan and Ofoto scanning software save the blank areas of a scan as white pixels to a PICT file, but as transparent pixels to a TIFF file. Other scanning sofware may behave similarly.

Workaround #2
MacDraw II 1.1 allows changing the background color of a bitmap to transparent. Thus, one workaround to this problem is to open the bitmap in MacDraw II, save, then Open/Place the file in MacDraw Pro.

Printing and Plotting with Radius Rocket Accelerator

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
NOTE: A fix for this problem is available from Radius.

Problem: Using an HP Draftmaster in Final Mode and about 3-4 minutes into the plotting, the plotter just stopped. This occurred on many documents with sufficient memory to plot.

Cause: Per Radius, there is a serial problem between the Radius Rocket Accelerator and the ImageWriter II, LQ, and HP DeskWriter. It is manifested by a loss of handshaking whereby the buffer overflows and the printer just stops.

Temporary Solution: Turn off the Accelerator when plotting. In addition, have the customer call Radius so that they may be logged in to receive their fix when it becomes available.

MacDraw Pro: EPSF Objects Display Incorrectly when Zoomed Out

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
The following steps recreate the problem:

1) In MacDraw Pro 1.0v1, create a rounded rectangle and an oval
2) Fill them with any fill pattern
3) Save out as an EPSF file
4) Open the EPSF file as a new document
5) Zoom out

The fill pattern may not be visible on the screen. Diagonal line-type fill patterns seem to disappear at about 50% zoom level. Dark gray fill patterns disappear at about 25% zoom level.

The EPSF will print correctly, however. This is only a screen preview problem.
Published Date: Feb 18, 2012

Claris CAD: Exporting EPSF Files

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
You can export Claris CAD files to EPSF by using EPSF XTND filter version 1.2v2 or later and the EPSF filter that ships with MacDraw Pro, ClarisWorks, ClarisDraw and ClarisImpact. The translator (EPSF Kit, which includes instructions) are available on request from Customer Relations. You will need Claris CAD 2.0v3 or later to export EPSF.

The EPSF translator that ships with FileMaker Pro will not work in Claris CAD. This translator is named EPSF PFLT. The correct filter will just be EPSF.

To use the filter, just select EPSF in the Save As dialog. The file will be translated upon saving.
You cannot import EPSF into Claris CAD.

Instructions for using the filter are also provided on page 6 of the Release Notes. What you need to know is:
1) Points created with the point tool will not be exported.
2) Type 3 downloadable Postscript fonts will not be saved.
3) Walls need to be unjoined before exporting.

To unjoin all of the walls in a drawing quickly:
1) Open the Layers floater and click on Multi-layer selection.
2) Select the wall tool.
3) Select all.
4) Go under the Arrange menu and select Unjoin.

If you have CGT, you can translate a file from IGES or DXF to EPSF. Translate the file from IGES or DXF to Claris CAD format via CGT, then open the file in Claris CAD and save it out as EPSF.

MacDraw Pro: Minimum Memory Requirements

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
MacDraw Pro REQUIRES 2 MB (with System 6) and 4 MB (with System 7).

This information is different than the information in some of our literature. Some literature was printed earlier when the memory requirements were confirmed. (For example, literature states that "1 MB is required, 2 MB is recommended). If customers ask about the memory requirements of MacDraw Pro, please state the 2/4 MB minimum requirements.

MacDraw Pro: Printing Gradients is Slow to StyleWriter

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.

Printing gradients can be very slow when printing to the StyleWriter. Printing in Faster mode will significantly speed up the printing of gradients. (To do this, you'll have to uncheck the Maximum Resolution option in printing Preferences.)

MacDraw Pro: Issue Word 3.0 XTND Filter

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.

MacWrite II 1.1 comes with an XTND filter for Word 3.0 (Macintosh) files. If this filter exists in the Claris Translators folder AND you use the Place File command in MacDraw Pro to place a Word 4.0 file AND you leave the popup menu in Place File set to show "All Available", MacDraw Pro will attempt to use the Word 3.0 translator to open the file. The result is an error message which says that the file is incompatible with the translator, and the file is unopened.

Solution:
1) remove the Word 3.0 translator, or
2) in the Place file translator popup menu, click on "All Available" and select "Word 4.0" instead.

ImageWriter LQ: Temperature Sensor Prevents Overheating

I have a problem with my ImageWriter LQ. Every month I do a payroll run, printing continuously for 2 to 3 hours. Often, at some stage, the printer just stops.

Is it overheating? If so, how long can an ImageWriter LQ print before it overheats?

This article has been archived and is no longer updated by Apple.
Yes, it is very likely that the ImageWriter LQ is overheating. There is a temperature sensor in the printhead that causes the printer to stop printing when the printhead temperature reaches approximately 190 degrees Fahrenheit. The ImageWriter LQ printhead reaches this temperature after printing pure black for about 1 hour. Depending on the text being printed, the printhead may overheat after approximately 2 to 6 hours of continuous printing.

Claris CAD: Clipboard Looks Incorrect (Splines)

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
This is corrected in Claris CAD 2.0v3

Q. I have copied a spline to the clipboard and when I look at the clipboard it looks incorrect. Why is this.

A. Claris CAD shows two versions of the Spline on the clipboard. The smoothed and the unsmoothed versions. There is no problem when you paste this object from the clipboard. (I.E. If the spline is supposed to be smoothed then it will be smoothed when copied from the clipboard.

Claris CAD: Point Tool (ID=28)

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.

Q. When using the "Point tool" in Claris CAD 2.0 (v1,v2 and v3) I get an ID=28.

A. This will happen when you are creating point number 2 or above and you do a "Command - Period" before clicking on the screen. If you do not hold down the Command Period keys before and during clicking on the screen to create a point this issue will not occur.

Q. When using the "Point tool" I do a select all and it seams that the points have exploded. Have I done something wrong.

A. No, you have not done something wrong. This will happen when you are creating point number 2 or above and you hold down the "Command - Period" while clicking on the screen. If you do not hold down the Command Period keys before and during clicking on the screen to create a point this will not occur.

Important Note: If either of the two above issues have occured this customers document is most likely broken. We should suggest that the customer create a new document and copy and paste the information into the new document.

LaserWriter LS Print Dialog Shows 75% & 50% Reduction Options Grayed Out

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
Issue: Using the LaserWriter LS 1.0, the print dialog box displays the 50% and 75% options as grayed out.

Solution:
In Mac Draw Pro 1.0v1 / 1.5, the "Maximum resolution" print preference setting checked--unchecking it allows for reduction printing. That's why the message '(may limit QuickDraw printer options)' appears.

In MacDraw II, any version, you can only print at 100%. You cannot print at 50% or 75%, as these options are grayed out. There is no workaround. MacDraw II Configure will not fix this.

MacDraw Pro: Possible Conflict Master Juggler

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
There may be a problem using MacDraw Pro 1.0v1 with Master Juggler. This is a customer-reported problem that has not been confirmed by Claris. The version of Master Juggler used is not known.

The issue: Adding some Adobe fonts, then removing about 10-15 fonts. After removing the fonts, the font menu became corrupted (presumably the MacDraw Pro font menu). The customer may have been adding / removing fonts while MacDraw Pro was open, but this is not known.

The same scenario was repeated using Suitcase without problems.

MacDraw Pro: Issue with EPSF XTND translator 1.0

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
This issue exists with MacDraw Pro 1.0v1 with the EPSF XTND translator 1.0

The following steps recreate the issue:
1. Import or paste a bitmap with transparent pixels into MacDraw Pro
2. Draw a square or other object, fill with a color and place behind the bitmap. The filled object should be visible through the bitmap.
3. Save As to an EPSF file. Open the EPSF file and print a color separation.

The bitmap will mask out the colored object underneath, as if the transparent pixels were white. There is no current workaround for this issue.

MacDraw II vs. Pro: Text Line Spacing Differences

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.

Open a MacDraw II file with multiple-line text blocks in MacDraw Pro. The line spacing will be different if the text is Times 12 or Helvetica 12. Other fonts and sizes appear to be unchanged between MacDraw II and MacDraw Pro. The line spacing can be changed in MacDraw Pro to match the line spacing in MacDraw II by using the Paragraph command in the Size menu, then resetting the line spacing in points. Here is a comparison of line spacing between MacDraw II and MacDraw Pro:

	MacDraw II	MacDraw Pro
Times 12	12 pts.	14 pts.
Helvetica 12	14 pts.	13 pts.

MacDraw Pro: Grouping Issue

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
This is fixed in MacDraw Pro 1.5v1

There is a confirmed issue in MacDraw Pro 1.0v1 where it may crash when you click on a group. The critical factor is the number of objects in the group. This number of objects is not a fixed number , but varies depending on other factors. Fortunately, it only happens when the Hide Notes command is selected, which is not the default setting. Here are the workarounds:

1) Select Show Notes. With Notes showing the issue will not happen. If you want to hide notes, do step #2, then select the Hide Notes command.

2) Ungroup the group. Either leave it ungrouped or change the number of objects in the group. For example, adding a transparent object to the group is acceptable.

Claris Resolve: Totaling Time Adds Up to More than 24 Hours

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
When I add or sum up hours in Claris Resolve, the total is less than it should be. What is going on?

If the total should be more that 24 hours, the information below will apply to you.

Claris Resolve stores time as a percentage of a day. So 2 hours and 40 minutes is stored as .1111, while 26 hours and 40 minutes is 1.1111. When the hours format is applied to a number greater than 1, only the decimal value used.

Here are some formulas that account for both the integer and decimal portions of the value:

=(Int(Sum(range)*24))&":"&(ATime(Sum(range),"nn:sc"))
Will display the total time in this format: 25:23:22 - (Hours:Minutes:Seconds)

=(Int(Sum(range)*24))&":"&(ATime(Sum(range),"nn"))
Will display the total time in this format: 25:23 - (Hours:Minutes)

=(Int(Sum(A1..A12)*24*60))&":"&(ATime(Sum(A1..A12),"sc"))
Will display the total time in this format: 153:45 - (Minutes:Seconds)

Explanation: These formulas calculate a sum of the range of times you wish to add, multiplies it by 24 and takes the integer, which peels off the decimal. This correctly calculates the total number of hours in the range. A colon is then added and the minutes and seconds are added to the end using the ATime function.

MacDraw Pro: Plotting Gradients

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
MacDraw Pro will not plot gradient fills with either MacPlot 1.2 or MacPlot Professional.

This behavior was implemented for the following reasons:

1. It's impossible to get a smooth blend since the plotter only supports seven colors.
2. Plotting gradients could be very time consuming and would wear out your pens.
3. MacDraw Pro implements Region Clipping when printing gradients and none of today's plotter drivers support this. In fact, MacDraw Pro is unable to recognize when you are printing with PLOTTERgeist and will end up plotting gradient fills beyond an object's boundaries because it is unable to clip it.

Book: Technical Drawing with Claris CAD
Publisher: Scott Foresman Professional Books, Carmel, IN 46032 - 800-969-4360

Over 500 pages of useful tips and hints, real-world examples and interesting case studies, Technical Drawing with Claris CAD shows readers how to solve specific drafting and design problems. It covers through Version 2.0 and Claris Graphics Translator. Find out why industry leader Dr. Joel Orr says: "Unquestionably the most cost-effective 'peripheral' a Claris CAD user can buy." It includes information and techniques for Claris CAD 2.0, a comparison with Auto*Cad and the forward is by Craig Young of CASE.

The book covers...

* Organizing and planning the Claris CAD work environment
* Mechanical and architectural drafting and design
* Schematics, wiring diagrams, charts and other diagrams
* Technical Illustration
* Informative case studies
* Claris CAD & AutoCAD comparisons and integration
* Use of Claris Graphics Translator
* Networked Installations
* Benchmarks

Order the newsletter...

Join today and receive a quarterly newsletter containing up-to-date information and news about Claris CAD, Claris Graphics Translator and co-operative applications and utilities. The newsletter is written for all levels of users, from beginners to experts, and covers all disciplines such as mechanical, architectural and engineering. A must for all serious Claris CAD users.

Claris CAD Newsletter:
* Tips and Hints
* Reviews of third-party products and utilities
* Clearinghouse for custom libraries, example drawings, macros
* Case studies
* Addresses and phone numbers of important Claris CAD resources

MacDraw Pro: Spell Check Issue

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
This is fixed in MacDraw Pro 1.5

Issue: Spell checking by selecting different text with the text tool can cause the computer to crash. The following steps illustrate the issue:
1- Create 2 text fields.
2- Double-click the text tool and click in the first text field.
3- Spell Check Selection.
4- When done, immediately click in the next text field.
5- Spell Check Selection again.

Solution: Do not spell check with the text tool double-clicked. Instead, single-click the text tool, check the spelling of the first text selection. Then select the text tool again (command-spacebar is the fastest way to do this), then check the spelling of the second text selection.

Or, select the text objects with the selection tool instead of the text tool, then check spelling.

MacDraw Pro: Screen Color does not Match Printed Color

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
Q: When I print from MacDraw Pro, ClarisDraw or ClarisImpact, the printed color does not match the screen color.

A. MacDraw, ClarisDraw and ClarisImpact do, in fact, output correct color information to the printer and screen. However, both monitors and printers vary greatly in the way that they output color. All monitors and printers output color with some degree of inaccuracy. In addition, no monitor or printer can reproduce the entire color spectrum, so there will be colors that can be viewed that can't be printed accurately, and vice versa. This is a issue that affects all color software. However, there are some things that you can do to improve the predictability of your color output.

1) Use Colorsync. This is a Control Panel by Apple that makes the colors on your screen display more accurately. Apple includes Colorsync settings for all Apple monitors. Many third party monitor manufacturers have Colorsync support files for their monitors as well.

2) Use a screen calibrator. Several companies sell screen calibrators that can improve the accuracy of color display.

3) Print a test page with color samples. Then choose the colors for your document based on this color output. If you're using different color printers for proofs and final output, remember to use a test print from the final output as your reference.

Claris Resolve: How to Add Items to the Utilities Menu

Here are some guidelines for adding items to the Utilities Menu and a short description of the items that are automatically loaded.

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
The following UTILITY scripts files are supplied with the program: Startup, Sounds, Zoom, Audit, Hide, Total, Print, Picture (Claris Resolve 1.1 adds the HostAccess script). These files may be used for the extra functionality they provide or as examples as to how to write your own scripts. These scripts may be found in the Utilities scripts folder on the Claris Resolve Samples Disk.

If you have a script named "Startup" in your "Resolve Scripts" folder or the Claris Resolve application folder, it is automatically run when the program launches. When this particular Startup file is run, it searches for specific scripts at the launch path or in the Resolve Scripts folder and, if found, installs them into a "Utilities" menu. Startup assumes that utility scripts are in Resolve Scripts folder or launch path (the folder in which the Claris Resolve application is located).

You can add your own scripts to the Utilities menu by following the conventions documented in any of the scripts listed below. Specifically, each script should

* Set the variable Startup:failed to FALSE().

* Add a menu item to the menu Startup:utilMenu which makes a call to a function in the utility script.

* Add a call to load the script in Startup using CALL loadScript("<script name>").

Read the comments in the Startup script for more details on this procedure.

The "Hide" script collapses entire rows or columns and places a button for expanding and collapsing the row or column. This makes creating a summary sheet easy.

"Audit" checks for and "circles" Errors, References to Blank Cells, Unreferenced Cells, Locked Cells, and Circular References for more accurate worksheets.

"Picture" allows you to open any PICT file and place it into your worksheet.

"Print" provides the convenience of printing any selected range of cells without having to select Page Layout.

"Sound" creates a button and allows you to record a sound to attach to it. This requires System 6.0.7 or 7.0.

"Total" automatically totals the columns and/or rows of a selected range of cells. It creates a "total" row and/or column. Note: If the the right column or bottom row are blank, then Total will only sum into those cells. If the cells designated for totaling are not empty, then Total will alert the operator that it can not delete existing data.

"Zoom" will resize a worksheet window to any of four different sizes. If you are
developing a custom template and want to see how it will appear on a operator's machine with a different monitor, you can quickly make changes.

Claris Resolve: How to Import PICT Images

Here'a a technique for importing PICT images into Claris Resolve without using the Clipboard.

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
Claris Resolve has the ability to import a PICT image without using the clipboard. This is done with an associate script called GET PICTURE which ships with the program. The Get Picture function requires the Utilities menu to be on the menu bar.

Simply select a range of cells (you need not be very specific) and choose get picture under the utilities menu. Choose the PICT image through the generic open dialog box. You can then drag picture to your desired location.

For instructions on how to install the Utilities menu, search for "How to install the Utilities Menu."

Claris Resolve: Adding Sound to a Worksheet

Here's how to add sound to your Claris Resolve worksheets.

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
To add sound to a Claris Resolve Worksheet:

1. Place all sound and startup utility scripts inside the Resolve Scripts Folder inside the Claris Folder inside the System Folder. Connect a sound recording device (MacRecorder with its 1.01 Init and Virtual Memory off or equivalent) or use a machine with built in sound input.

2. Launch Resolve

3. Make sure that the Utilities Menu is in the menu bar. If it does not appear there, select "run script" and choose the Startup script in the Resolve scripts folder.

4. Close the Worksheet you want to add sound to.

5. Go to the Utilities menu and pull down to Sound... Add sound...

6. The Standard file dialog will come up and ask you to choose a Worksheet to add to...

7. If you have the microphone or other input device hooked up correctly, you should now see the audio palette and be able to hit record, say something and close the palette and get an audio button dropped on your worksheet which, when pressed, plays your sound.

MacDraw Pro: Exporting Rounded Rectangle as EPSF

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.

The EPSF filter does not export Rounded Rectangles correctly. If a Rounded Rectangle has Round Ends turned on (from the Round Corners dialogue box) and is saved out as an EPSF file, then imported (either into MacDraw Pro, PageMaker or Quark Express, etc...), the arcs will shift when they are printed. The rectangle will look fine on the screen.

A workaround is to use a custom radius for the rectangle. This should allow the rectangle to export properly.

Claris Resolve: Negative Precision

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
The Format(15) command returns the absolute value of the current format's precision. If the precision is negative, therefore, you will get an inaccurate result from this function.

Not listed in the Scripting Reference due to a very late addition, is the Format(32768) function. This new argument to the Format() function determines whether or not the precision is negative.

You can use these arguments in conjunction with the If function to return the proper precision:

If(Format(32768), 0 - Format(15),Format(15))

MacDraw Pro: PICT File is Larger than Original File

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
There is a known issue saving out to a PICT file from MacDraw Pro 1.0v1 or 1.5v1/v2. The PICT file will be slightly wider and taller than the original MacDraw Pro file.

This issue is most noticeable when saving out drawings with a colored background, such as creating slides to be sent to a slide bureau. The colored background is created by filling the entire drawing with a colored rectangle. When this is saved as PICT, the drawing is slightly larger than the colored rectangle by about 1/4", both horizontally and vertically. This extra width and height will, of course, be empty. Thus, the slide will not be entirely filled with a background color.

There is no current workaround to this issue.
Published Date: Feb 18, 2012

MacDraw Pro: Text Not Printing to Personal LaserWriter LS

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
Note: this issue is only occasionally reproduceable. It does not appear to be strictly related to Truetype usage or memory levels.

When printing from MacDraw Pro 1.0v1 to a Personal LaserWriter LS, horizontal (non-rotated) text will only print on page 1. Horizontal text will NOT print on any succeeding pages. This issue has been reproduced when printing from a Macintosh LC / 6.0.7 / TrueType. This issue did not occur when printing from a Macintosh IIci with ATM.

Workaround:
1) Select all the text objects. (Click the text tool, press command-A; the text objects should be ungrouped)
2) Click the corner-center control to set it to the corner position. (See page 1-7 of the MacDraw Pro User's Guide to see where the corner-center control is at.
3) Rotate the text objects 180 degrees. (Select the Rotate command. While holding the Shift key, rotate the text 180 degrees, so its upside down. Each text object will rotate around its center.).
4) Flip Horizontal, then Flip Vertical. The text will appear reoriented to its original position. It will now print correctly.

Here are some other characteristics of the issue:
- Rotated text will print correctly
- The issue occurs with either 1.0 or 1.1 of the LS driver
- Printing back-to-front is not a workaround. Horizontal text only prints if its on the page in the upper-left corner of the drawing
- Changing the color has no effect
- Print monitor settings have no effect

Claris CAD: Line Styles

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.

Q. I have just translated a document from DXF to Claris CAD and every time I try to edit Line Styles within Claris CAD my machine bombs. What can I do to fix this issue?

A. We are aware of this issue. The actual document is not damaged when this occurs. If you copy the current document to the clipboard and paste it into a new document everything should work correctly.

MacDraw Pro: Autographix Driver

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
There has been some confusion about using the Autographix driver with MacDraw Pro. Apparently, some customers have been told by Autographix bureaus that they don't take MacDraw Pro files.

The Autographix driver IS compatible with MacDraw Pro. They are working on an update for MacDraw Pro to fine-tune it, but the current driver does work.

MacDraw Pro: 20-Tab Limit for Text Objects

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
There is a limit of 20 user-set tabs that can be created in a MacDraw Pro text object. This limit is hard-coded into the program. If you try to add a 21st tab into an object's text ruler, you will not be able to grab the tab from the tab well. This limit applies to tabs set by the user, not the preset tabs that occur every 1/2".

Claris Resolve: 32k Maximum Allowed in Text Fields

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
This issue has been corrected in Claris Resolve 1.0v3

Text fields and object scripts (buttons and fields) in Claris Resolve can have a maximum of 32k of information per object.

There is another issue, however, relating to this limit. Claris Resolve will allow you to put more than 32k in an object but will not warn you! Once the file is saved and closed, you will not be able to reopen the file.

Files saved by WingZ or saved in the WingZ format will not exhibit this issue when opening in Claris Resolve. The reason? We do not check the contents of objects when converting a WingZ file. This is not to say that WingZ does not have the same 32k limit, they just fail to check for it when opening their files.

Claris Resolve: Memory Requirements

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
Claris Resolve has a maximum cell capacity of 32,768 rows by 32,768 columns, provided you have enough memory.

How much memory?

A 1000-row by 1000-column worksheet, including numbers 1 through 1,000,000, requires a minimum of 17MB allocated to Claris Resolve. Even at this setting, you may not have enough memory to perform all operations, but the worksheet will open. Complex operations will require additional memory.

MacDraw Pro: Mode 32 Issue

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
This is fixed in MacDraw Pro 1.5

There is an incompatibility between MacDraw Pro 1.0v1 and Mode 32. The symptom is that text will not select or highlight properly. When attempting to select text, the highlighting is in the wrong place on the screen. The cursor may appear away from the text.

Mode 32 is an INIT that allows Mac II / IIX / IICX / SE30 to use virtual memory, thus allowing the computer to address more than 8 MB RAM (for example, a Mac II could address up to 14 MB RAM).

TA41733_GOSIP_Government_OSI_Profile_Information_(TIL05465).pdf

GOSIP (Government OSI Profile) Information

What is GOSIP? How close is it to being a standard?

This article has been archived and is no longer updated by Apple.
The Federal Information Processing Standard has already adopted the Government Open Systems Interconnection Profile (GOSIP).

GOSIP defines a common set of data communication protocols that let systems developed by different vendors interoperate and lets the users of different applications on these systems exchange information. These Open Systems Interconnection (OSI) protocols were developed by international standards organizations, primarily the International Organization for Standardization (ISO) and the Consulative Committee on International Telephone and Telegraph (CCITT). GOSIP is based on agreements reached by vendors and users of computer networks participating in the National Bureau of Standards (NBS) Workshop for Implementors of Open Systems Interconnection.

GOSIP shall be used by Federal Government agencies when acquiring computer network products and services and communications systems or services that provide equivalent functionality to the protocols defined in the GOSIP documents. Currently, GOSIP supports the Message Handling Systems and File Transfer, Access, and Management applications. GOSIP also supports interconnection of these network technologies: CCITT Recommendation X.25, Carrier Sense Multiple Access with Collision Detection (IEEE 802.3), Token Bus (IEEE 802.4), and Token Ring (IEEE 802.5). Additional applications and network technologies will be added to later versions of the GOSIP document.

This standard became effective February 15, 1989. For a period of 18 months after the effective date, agencies are permitted to acquire alternative protocols that provide equivalent functionality of the GOSIP protocols.

Claris Resolve: Confusion About Negative Text Color

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
The manual's explanation of the Negative Text Color option in the Set Formats dialog is incorrect and misleading.

Negative text color cannot be "Turned off." A value is always stored for negative text color. You can set the Negative Text color to the same color as your normal text but this is not the same turning it off. If the normal text color is changed, the negative color will remain the same.

The check box next to the Negative option in the Set Formats dialog box does not turn the Negative Text Color off as stated in the manual. This check box tells Claris Resolve whether or not to apply the currently chosen color (in the pallet) to ALL the cells in the selected range.

For example:
If you select a range that has different Negative Text Colors specified, checking the box would apply whatever color is selected in the pallet to ALL the cells in the selected range. Unchecking the box would leave the the text color(s) the same (i.e. different cells would remain different).

MacDraw Pro: Faster ImageWriter Printing MacPalette II

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.

There is an option for the customer to get MUCH faster printing from MacDraw Pro (and other applications) to an ImageWriter II. Purchase MacPalette II by Microspot. This is a third-party replacement print driver for the ImageWriter II. It requires a Mac with color ROMS (Mac SE/30, LC or any Mac II).

MacPalette not only prints faster, but dithers gradients and other colors for better print quality. The speed difference is especially pronounced when printing from System 7, which is slower printing to an ImageWriter than System 6.

Speed comparison: In the test print using MacDraw Pro 1.0v1 (which included one large 4-color gradient and a text block, printing from a IIci using System 7), the Apple ImageWriter driver took just over 30 minutes to print. The MacPalette II driver took 4:58 to print the same document.

This product has not been fully tested with MacDraw Pro by Claris SQA. However, initial tests show no noticeable issues.

Claris CAD: GDT Font vs. GD&T Font

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
The GDT font was changed to GD&T for Claris CAD 2.0v3, which was also the first System 7 compatible version. The name was changed due to the fact that there is a company named GDT that produces postscript fonts and drivers

GD&T, which is a collection of frequently used drafting symbols designed to look good when plotted (stroked rather than bitmapped), is not automatically installed with the Claris CAD installer.

To install the font under System 7, simply drop the font onto the System folder an click OK when it asks if you want to put it in the System file. You could also drag it directly onto the System file.

Files that were created with earlier versions of Claris CAD will not have the GD&T font immediately available, and may show the GDT font, which will not be available. To remedy this, go under the Font menu to Fonts... Select Change menu, show the GD&T font and remove the GDT font.

Claris CAD: How To Set The Paste Point of an Object

his information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
To set the paste point of an object in Claris CAD:

1) Select the object..
2) Hold down the command key and click the point.

You can use modifiers to select the point, and the point does not have to be on the object itself. In other words, you could draw a circle, select it, hold down shft-cmd and click on a point 1/2" to the right of the circle. When you copy and paste the circle, the circle will paste 1/2" to the left of the last point clicked. There is no way to tell where the paste point is on an object other than clicking a given point then pasting the object and seeing what point on the object pasted at the point that you clicked.

Here's an example: Let's say that you have a square and you want to paste a copy of a circle with their top most points pasted right on the corners of the square:

1) Draw the square and the circle.
2) Select the circle. Use the endpoint modifier (which will find the left, right, bottom or topof a circle), hold down the command key and click the top of the circle. Hit Copy.
3) Use the corner modifier to select the a corner of the square and hit Paste. The circle will paste with its topmost point on the corner. Repeat for the other corners.

Paste points paste at the last point clicked as long as that point is showing in the active window (or is behind a floating window). If the last point clicked is not in the window the object being pasted will appear with the paste point in the center of the current window.

Paste points are retained when objects are pasted into a library objects. You can apply a paste point to a group.

Claris Resolve: Printing Charts Copied in Landscape Mode

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.

If an operator creates a 3-dimensional chart in Claris Resolve1.0v1, copies and pastes it into another application (e.g. Microsoft Word, MacWrite II, etc.), the text along the axis (axes) will not print correctly if printed in the Landscape (sideways) mode. The text along the axes will be garbled, run together and be unreadable.

This will not occur if the graph is printed in the portrait (upright) mode with the exception of Aldus PageMaker.

One reported work-around is to paste the graphic into MacDraw Pro and save as a PICT2 document.

Published Date: Feb 18, 2012

Claris Resolve: Error Message "Invalid Command"

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
There are times when the "Invalid Command" error occurs while using the "Pasting Function" feature.

In virtually all these cases, the issue can be traced back to a Software FPU INIT located in the system file. This INIT simulates the floating point co-processor (68881 & 68882) built into higher-end Macintosh models.

Removing this INIT eliminates the issue.

StyleWriter: Prints Incorrectly with Print Monitor Turned Off

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
This is fixed with the StyleWriter driver version 7.2.2, which is included with the System 7 Tuneup 1.1.1.

The StyleWriter driver version 1.1 prints incorrectly when BackGround Printing is TURNED OFF. This is a issue with the print driver and Print Monitor, not with a Claris product.

To Reproduce
1) Open Claris CAD, MacDraw II or MacDraw Pro.
2) Show Rulers.
3) Open the Drawing or Drawing size dialog and add 2 pages horizontally for a total of 3 pages.
4) Draw a rectangle approximatley 1" wide that straddles the 18 1/4" ruler mark and fill it with a pattern.
5) Print the third page in "Best" mode with Background Printing "Off".
The rectangle will print the entire width of the page.
Note: If the Rectangle is located entirely before or after the 18 1/4" mark it will either print correctly or not at all.

Workarounds
1) Print in Fast Mode
2) Turn Background Printing "On"
3) Use Stylewriter printer driver 7.2.2 or later, or version 1.0 (7.0).

MacDraw II: System Error when Saving on Quadra

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
This is fixed in the MacDraw II XTND translator (1.0v4) that ships with MacDraw Pro 1.5

Saving As a MacDraw II file from a Quadra with the 040 cache enabled will result in a system error. This system error happens when saving from both Claris CAD 2.0 and MacDraw Pro 1.0

The workaround is to turn off the 040 cache before saving as a MacDraw II file, or upgrade to the MacDraw II XTND translator 1.0v4.

Claris CAD: TIFF File Does Not Appear in Open or Place File Dialog

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.

If you have a TIFF file that Claris CAD will not display as openable in the Open File or Place File dialogs, the file may have an internal format that Claris CAD does not recognize. This is especially likely if the TIFF file came from a non-Mac platform. Claris CAD determines whether it can read the file by the files internal structure rather than by type or creator.

You may be able to open the file in Photoshop and save it out using the LZW compression routine. To do this, select Save As... from the File menu, then select TIFF as the file format. When you hit Save, a dialog comes up with the TIFF options, Click the LZW compression check box and hit OK. Claris CAD should be able to read the file.

MacDraw II: Printing Documents with System 6.0.x

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
Customers have reported issues when printing MacDraw II 1.1 under System 6.0.x (e.g. 6.0.5) with background printing and LaserWriter 7.0. These users have reported that the graphics in a document will not print, parts of the drawing was missing. If they take the illustration to another application, (e.g. MacWrite II) the objects will only print on some pages, while only text will print on other pages.

To see if this is the issue, have user create a new folder and move System, Finder and LaserWriter from the System Folder into this new folder. Restart. The issue will go away.

I believe matching the system to the LaserWriter version (System 6.0.x with LaserWriter 6.0.x or 6.1) with associated files (e.g. Print Monitor and Backgrounder 6.1) will correct the issue on a permanent basis.

Claris CAD: LimitCheck Error

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
Issue: When printing a document with a polygon, a LimitCheck error is generated.

Solution: Divide the polygon in half, and have it display and print the same way as the original:

1) Select the polygon. You might want to copy it to a new document so that it is easier to work on.
2) Duplicate the polygon.
3) Hit Reshape (command-R) from the Edit menu and click on one of the copies of the polygon.
4) Mentally choose a point (vertex) near the middle of the polygon; that is, so that there are approximately the same number of points on either side. Draw an arrow to the point if you wish.
5) Drag the Reshape cursor around all of the points on the left (or top) of the point you have mentally chosen, NOT including that point itself. Hit the delete key.
6) Click on the other copy of the polygon to select it. Drag the Reshape cursor around all of the points on the right (or bottom) of the point you have mentally chosen, NOT including that point itself. Hit the delete key.
7) You now have two polygons, one with the all of the points on the left (or top) and one with all of the points on the right (or bottom). They both have the point that you have chosen as one of the endpoints, so just move one of the polygons so that that point overlaps.
8) The polygon appears as it did originally , but it is now two separate polygons. It will be OK to group them. Since each polygon has about half of the number of vertices of the original, it should print without generating the LimitCheck error.

Claris CAD: Broken Document

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
This issue occurs under version 2.0v1 through 2.0v3

Issue: You will have a broken document if you have used Undo on a Hatch pattern that has one single line segment.

Issue: You will have a broken document if "Show Layers above" is Unchecked while you are viewing some of the layers.

Answer: It is suggested at this time that you do a select all and copy and paste it into a new document. If you need to retain layer information it is suggested that you copy the information over in the following manner.

1. Turn off multi-layer selection.
2. Go to each layer and do a "Select All" and "Group."
3. When completed with #2 above then Select the objects across all layers.
4. Copy everything from the old document to the new document.
5. Close the old document.

Each layer will now be grouped separately in the new document. If you select each group and cut and paste it to the correct layer you will have a new document that is ready for you to work in.

If you think that there will be a issue placing each layer directly over each other, you can paste a point in a given location (for example, X = 2, Y = -2) on each layer. Then when you paste each layer (making sure that everything on the layer is selected, drag by the point to the correct location.

Claris CAD: Crashes When Guidelines are Left Behind.

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
This issue has been fixed in 2.0v2

Issue: When using the Click-Click method and using the location bar to draw an object, Claris CAD will sometimes bomb. A good indication is when the graphics guidelines are left behind on the screen.

Solution: If you are having issues with this we suggest using click-drag or the click-lock methods.
Published Date: Feb 18, 2012

Claris CAD: Prints Rotated and Non-Rotated Versions of Object

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
This issue is fixed in 2.0v2

Issue: When plotting a rotated object (I.E. Ellipse, Rounded Rectangle or Arc) that is filled with a non-solid colored pattern Claris CAD 2.0 prints the rotated and the non-rotated version of the object.

Solution: Instead of using the bitmap fill pattern you could create the desired results by filling your object with hatches. When plotting with hatches you will notice that your plots will print faster because the plotter is not bitmaping your fill pattern.

Claris CADL: Document Printing "Clipped" to Color QMS Printer

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
Issue: When I print my document on a QMS Colorscript color Postscript printer, the objects at the edge of the page are clipped off.

Solution: The printable area for the QMS color printers is smaller than the default printable area encoded into the LaserWriter print driver. For example, the top margin of the Colorscript printer is almost 1 inch, whereas the top margin of the LaserWriter driver is about 1/4". When MacDraw and Claris CAD calculate the page breaks for a drawing, they use the printable area as defined in the LaserWriter driver. Thus, documents printed to the QMS Colorscript printers may be clipped unless you take certain precautions.

First, the drawing size should be limited to one page vertically. This is because there is no way to increase the top margin to match the printer.

Second, do not place any objects in the top 3/4" or so of the page. This area will be clipped when printed.

Claris Resolve: Formula References are Not Copied

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
Issue: When I cut and paste my formula, sometimes the formula copies, and sometimes the cell shows as zeros. What's wrong?

Solution: Like most spreadsheets, when a formula or range of formulae are Pasted after performing a Cut, the cell references will not be changed (i.e. they will act like absolute references even if they are defined as relative). This is referred to as Moving your formula.

There is a bug, however, that may cause this feature to work incorrectly. If the cells directly to the right and left of the range being Cut are formatted in something other than General, the formula references will change (this is normal when performing a Copy).

This issue was corrected in Claris Resolve 1.0v3.
Published Date: Feb 18, 2012

Claris CAD: GD&T Font Floater Does Not Appear

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
Issue: When I select the GD&T Font (formerly known as GDT Font), the floater will not appear. Why?

Background and Solution: If you install Claris CAD 2.0v3 and don't install the GD&T font, when you go to use the font the floater will not appear. In most cases this will happen when a user has had a previous version, which had the font named GDT. In Claris CAD 2.0v3 and later, the program is looking for the font by the name GD&T.

To correct the issue, use the Font/DA mover to de-install the GDT font, and install the GD&T font.

Claris CAD: LaserMax Printers Issue

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
LaserMax produces drivers and laser printers that print at fairly high resolution (up to 1000 DPI). There has been a report that these printers will not print dashed lines from Claris CAD. We have not been able to test this printer to confirm or deny that this issue exists.

This printer and driver were not certified with Claris CAD 2.0v3.
Published Date: Feb 18, 2012

Claris Resolve: ON ACTIVATE Limitations

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
The ON ACTIVATE handler in Claris Resolve has some limitations. Basically, any command that will cause the worksheet that contains the handler to move to the background (i.e. open another window or dialog) will not be executed.

This is not a bug, it was designed this way to prevent operators from getting themselves into endless loops. WingZ did allow some of these commands to be placed in this handler.

Examples of commands you cannot use include:
* OPEN filename
* OPEN SCRIPT filename
* OPEN DIALOG
* OPEN SCRIPT DIALOG
* GO TO WINDOW string
* USE DIALOG BOX
* MESSAGE text
* HELP number
* SAVE DIALOG
* NEW SCRIPT string
* NEW WINDOW [LOCATION (X,Y) (X,Y)]
* NEW WORKSHEET filename [LOCATION (X,Y) (X,Y)]

NOTE: This is not a complete list.

LaserWriter Family: How To Print Test Page w/o Resetting Printer

What is the PostScript code for resetting the LaserWriter test page?

The code below does perform a reset on all PostScript LaserWriter models produced as of this writing. This includes the LaserWriter, LaserWriter Plus, LaserWriter IINT, IINTX (both ROM versions), IIf, IIg, and Personal LaserWriter NT.

This article has been archived and is no longer updated by Apple.
The following code completely resets the LaserWriter to power-on condition, which is the same as turning the power off and on. This is the only way to get a startup page without turning the printer off and on.

```
serverdict begin 0 exitserver
systemdict begin quit end
```

Note that this behavior of the quit operator outside of the server loop isn't specifically defined by Adobe. It may change in later revisions of PostScript, so it shouldn't be relied on to restart future LaserWriter models.

The following PostScript program prints a page that gives you the current page count (including the page itself) without resetting the LaserWriter (the comments aren't necessary):

```
/Times-Roman findfont %Lookup font in fontdict and push it on stack
15 scalefont setfont %Push size, scale it, and make it the current font.
72 700 moveto %One inch over, and 700 72nds up.
statusdict begin %We'll be using two operators from statusdict.
32 string %Push an empty string of 32 length on stack.
printername %Puts the LaserWriter name in the string on the stack.
show %Show the topmost string from the stack at 72 700.
( has printed ) show %Push another string and show it.
pagecount 12 string %Push the pagecount and a 12 length string onto stack.
cvs show %Convert the pagecount into the string and show it.
( pages.) show %Push the final string and show it.
showpage %Draw the image and spit out the page.
```

ClarisWorks: AppleWorks File Conversion

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
The following AppleWorks files can be opened from within ClarisWorks:

* AppleWorks 2.0 and later Word Processing, Data Base and Spreadsheet files
* AppleWorks GS Word Processing files (for DataBase files save to DIF or ASCII format and for SpreadSheet documents save to SYLK or ASCII format before following the steps below)

The easiest way to convert AppleWorks files is to use a 3.5-inch floppy disk and Apple File Exchange. Apple File Exchange is a file transfer utility which is included in the Macintosh system software. 3.5-inch floppy disk drives are standard equipment with the Apple II GS and the IIc+ and are also available for the IIe and IIc from your Apple dealer.

Once your AppleWorks files are saved on an 800K, 3.5-inch disk, any Macintosh with a high density 3.5" drive, also called a SuperDrive or FDHD, can transfer them to Macintosh format.

To use Apple File Exchange:

1. On the Macintosh, launch the Apple File Exchange application by double-clicking on its icon.

2. Insert your AppleWorks data disk in the disk drive.

Directories of the destination disk (left side) and source disk (right side) appear in the Apple File Exchange window.

3. Under the ProDOS to Mac menu at the top of the window choose Default Translation. Make sure that no other items in this window are checked.

4. Select the AppleWorks files to be transferred from their directory.

5. Either choose an existing folder on the destination disk for the files or create a new one by clicking the New Folder button. At the prompt, name the new folder.

6. Click Translate.

The AppleWorks files you selected will be translated to Macintosh files. You may either translate more files, or choose Quit from the File menu. Your disk will be ejected when you quit.

Opening the files with ClarisWorks:

When you wish to open your AppleWorks files in ClarisWorks, launch ClarisWorks, choose Open from the File menu, and navigate to the folder which contains your translated files and select it by clicking on its name.

When the Open dialog box appears, click on the Import Options flag. This will reveal a sub-menu of file types which can be imported by ClarisWorks 1.0. When you select the type of document you wish to open, a list of available files of that type will appear. NOTE: If you are using ClarisWorks 2.0 then the Open Dialog box will not have an Import Options flag but instead there will be a pop-up menu that allows you to choose the file type you wish to import.

Choose the desired converted file(s) by clicking on its name and then click the Open button.

When converted files are saved, they are saved as ClarisWorks files and have a ClarisWorks Icon.

Apple File Exchange can also be used to convert ASCII (text) files in ProDOS format, as well as MS-DOS ASCII (text) files and some MS-DOS word processing files. Once converted, these files can be imported into ClarisWorks.

For more information about Apple File Exchange, consult the reference materials which came with your Macintosh.

ClarisWorks: Copying Summary Field Data from Database

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.

In a ClarisWorks database you can copy the results of summary field calculations. After coping this information you might paste it into a spreadsheet (or database) for further manipulation and charting.

For example, using a database of invoices you would produce a layout that gives a breakdown of the sales by salesperson.

1. Choose Insert Part... from the Layout menu and select Sub-Summary when sorted by: Salesperson.
2. Define the following field: TotalSales (summary, number result) = SUM ('Invoice Total').
3. Then use the Insert Field... command to place the field TotalSales on your layout and move it into the area above the Sub-Summary label.
4. Sort by Salesperson.

This database would then display your breakdown in Page View. In order to copy the total sales for each Salesperson:

5. Press the Enter key to ensure that no records are selected.
6. Choose Copy Summaries from the Edit menu or press Command-C (Mac)/Ctrl-C (Windows).

Once pasted into a spreadsheet, the summary field data from each occurrence of a Sub or Grand-Summary part will be displayed in a different row. Each field will appear in a separate column, displaying the summary information from left to right in the order that the fields were defined.

If you want their names, as well as the data, you'll need to create a Summary field as follows, and place it in the Sub-Summary part as well:
SalespersonName (summary, text result) = 'Salesperson'

ClarisWorks: Deleting Records in the Database

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.

ClarisWorks does not provide a menu command for deleting records. Records are deleted by using the Cut or Clear command in the Edit menu.
To delete a record:

1. While in Browse mode, click anywhere in the record except inside a field. The record will highlight on screen.

2. Choose Cut or Clear from the Edit menu.

In ClarisWorks 3.0 and 4.0, a Delete Record command has been added to the Edit menu.

ClarisWorks: File Not Found Message when Converting Documents

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.

ClarisWorks and ClarisImpact use translators to open files created by other software programs. When these translators are not installed properly, you may get a message saying "File not found." All three items below should be found in the folder called "Claris" located in the "System Folder" on a Macintosh and in the Claris directory on a PC.

ClarisWorks Translators (translates spreadsheet & database formats)
- Files ending in .XTD on PC's

Claris XTND System (manages entire conversion process)
- XTND.DLL for the Windows version

Claris Translators folder (contains translator files for word processing & graphics formats)
- This is not used for the Windows version

If one or more of these is missing, re-install the translators using the ClarisWorks Installer disk (Reinstall the entire application for Windows users). If this does not solve the issue then find the file called XTND Translator List (XTNDTRAN.LST for Windows) either in the Claris folder/directory or the Preferences folder and delete it. The XTND Translator List is rebuilt at launch of ClarisWorks or ClarisImpact so make sure the program has had a chance to rebuild this file before trying your conversion again.

ClarisWorks: AppleWorks Evaluate Formulas Differently

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
This issue is corrected in 1.0v3.

AppleWorks and ClarisWorks evaluate formulas differently. Appleworks evaluates a formula from left to right. Clarisworks evaluates an * or / operator before + or -, even if that operator is to the right in the formula. For Example, 1+2*6 results as 18 in AppleWorks. However, since ClarisWorks evaluates multiplication and division before subtraction, ClarisWorks would return 13. To resolve this issue ClarisWorks should translate 1+2*6 to ((1+2)*6).

ClarisDraw: ImageWriter Roll-Back when Printing

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
Issue: The ImageWriter rolls back when printing in the draft mode.

Background & Solution:
When printing in Draft mode to the ImageWriter, objects are printed in their stacking order. To avoid the roll back, adjust the stacking order of the objects by starting in the upper-left of your document or layout, select each object, and under the Arrange Menu, select Move to Front. Continue this for each object, working from the upper-left to the lower-right object on the layout.

ClarisWorks: Objects Shift When Copied or Saved as PICT

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.

Images Shift When Copied to Another Application or Saved as PICT

Objects that are copied and pasted from ClarisWorks into another application may shift slightly because the clipboard may be unable to record highly precise alignments you achieve in a ClarisWorks document.

To avoid shifting, create your ClarisWorks document with the ruler set to 72, 36 or 18 divisions per inch and turn the Autogrid on. Objects created under this ruler setting can be copied and pasted or saved in a PICT file with significantly less shifting.

In ClarisWorks for Windows, this shift can be caused by minor precision errors when ungrouping Windows Meta-Files.

ClarisWorks: Opening Text Files in Spreadsheet or Database

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
The Import Options in the Open dialog in the Spreadsheet and Database include the following standard file formats:

* DIF
* SYLK
* ASCII Text (Tab-Delimited)

DIF - used mostly for databases because it retains field names.
SYLK- used mostly for spreadsheets because it retains the formatting information and calculation formulas.
ASCII text - ClarisWorks supports Tab-delimited text. To open other text formats (such as Comma-Separated) you have to convert it to tab-delimited, using the Word Processor.

1. Choose Find/Change from the Edit menu.
2. Click in the Find text field and type a comma.
3. Click in Change text field and type Command-Tab or \\t.
4. Press Change All and then OK to confirm (this changes all commas to tabs).
5. Choose Find/Change from the Edit menu.
6. Click in the Find text field and type a double-quote.
7. Select and delete the text in the Change text field.
8. Press Change All and then OK to confirm (this changes the Quote marks to blanks).

NOTE: This method strips out commas indiscriminately.

ClarisWorks: Out Of Memory Message with the HyperTour

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
The ClarisWorks HyperTour has been tested with all versions of HyperCard from 1.2.5 through 2.1. The minimum memory requirement for HyperCard is 750K, and if the user has manually decreased this, they will receive a message that more memory is needed.

Solution: Increase HyperCard's memory allocation in the Get Info window or under System 6, make more memory available to HyperCard by turning off extensions or turning off MultiFinder.

MacDraw Pro: Colored Patterns Printing Incorrectly to LaserWriter

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.

To print color patterns directly to a Postscript printer, you need a Postscript Level 2 print driver (e.g., LaserWriter 8 driver) and a Level 2 printer (e.g., IIf, IIg, LaserWriter Pro). To print color patterns with an older printer driver or printer, save to an EPSF file, open or import the EPSF file, then print. If saving to an EPSF file, you must use the EPSF XTND translator included with MacDraw Pro 1.5v2.

ClarisWorks: Border Doesn‘t Print

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
ClarisWorks versions through 3.0 will not print borders for the top most or left most cells of a Spreadsheet document when both column and row headers are hidden (this has been reported to occur also with the right and bottom most boarders). This issue has been corrected in ClarisWorks 4.0. If you are unable to upgrade to 4.0, there are two other ways to get around this limitation:

1. Put data in the second row or columns only
2. Copy the data from your Spreadsheet document into a Spreadsheet frame.

ClarisWorks: Checkboxes in Cell Border Dialog

his information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
ClarisWorks 1.0 Spreadsheet
The Borders... command does not indicate the formatting of the currently selected cell(s). The check boxes in the Borders dialog are always unchecked when this command is chosen. Therefore, clicking OK in this dialog without selecting a border check box will remove all borders for the selected cells.

Also, choosing Outline borders for a series of selected cells will not automatically turn off other border styles for those cells. To remove the current borders for a series of cells and outline all of them:

1. Select the cells.
2. Choose Borders...
3. Leave the check boxes unchecked and click OK to remove the current borders.
4. Choose Borders...
5. Click on Outline and then OK to outline the selected cells.

ClarisWorks 2.0 Spreadsheet and ClarisImpact Table Model
I f a checkbox has an X in it, all selected cells have that border checked. If a checkbox has a dash in it, one or more, but not all, of the selected cells have that border checked. If a checkbox is empty, none of the selected cells have that border checked.

TA41777_Apple_IItoIBM_Host_File_Transfer_(TIL05470).pdf

Apple II-to-IBM Host File Transfer

How can I transfer an ASCII file from an Apple IIe to an IBM mainframe?

I haven't been able to find any 3270 Apple II solutions. Assuming there isn't a Macintosh available, we could send the ASCII file from the Apple IIe over CompuServe or some other network to a Macintosh (or even an MS-DOS PC) connected to a mainframe. Then, we could make the ASCII-to-EBCDIC conversion and store it on the mainframe.

Are there any other solutions?

This article has been archived and is no longer updated by Apple.
There are two other options. All options, including the one you mentioned, are based on file transfer from the ASCII environment to the EBCDIC environment (microcomputer to mainframe host). This file transfer is where the conversion will take place.

The first option depends on the services available from the mainframe. This method requires a mainframe-attached protocol converter that uses the XModem protocol, plus a communications package on the Apple IIe that also supports XModem. This setup should allow the Apple IIe to dial directly into the protocol converter and upload the file to the mainframe.

The second option is to dial the Macintosh or MS-DOS PC directly instead of paying for a commercial communications service. Since both computers require modems to access the commercial service, and most likely use XModem for the transfer, there should be no difficulties connecting directly to one another with their communications software and using XModem for the transfer. Once transferred from the Apple IIe to the Macintosh or PC attached to the mainframe, the file can be uploaded from the Macintosh or PC using the host's file transfer method.

ClarisWorks 1.0: Technical Specifications

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
The following are the technical specifications of ClarisWorks:

Word Processing, Graphics, Spreadsheet, and Database Documents
* Max. Number of Open Documents - Limited by available memory
* Max. Number of Open Views per Document - Limited by available memory
* Max. Number of Objects (Frames and Graphic Objects) per Document - 65,536
* Max. Object Size for Frames and Graphic Objects - Limited by document size
* Min. and Max Header and Footer Size- 4pt. to 1/3 of chosen paper size.
* Min. and Max Margin Settings - Specific to the chosen printer.
* Min. and Max Printer Reduction - Specific to the chosen printer.
* Min. and Max. for Starting Page Number - 1 to 9000
* Number of Split Bars - 2 Horizontal and 2 Vertical (9 panes)
* Min. and Max. View Scale - 3.125% to 3200%
* Types of Rulers - 2 (Text and Graphics)
* Types of Ruler Units - 5 (Inches, Picas, Points, Millimeters, and Centimeters)
* Number of Divisions per Ruler Unit - 1 to 512
* Min. and Max. Object Scaling - 25% to 400% both horizontally and vertically.
* Number Formats - 5 (General, Currency, Percent, Scientific, and Fixed)
* Number of Text Styles - 10 (Plain, Bold, Italic, Underline, Outline, Shadow, Condense, Extend, Superscript, Subscript)
* Min. and Max. Font Size - 4 pt. to 255 pt.
* Number of Text Colors - 81
* Max. Number of Style Changes in a Text Frame or Set of Linked Text Frames - 65,536
* Number Precision - 0 to 15 places
* Date Formats - 5
* Time Formats - 4
* Dictionary - 110,000 words
* Thesaurus - 660,000 synonyms
* Max. Number of Macros - 65,536
* Graphics Formats Supported - 4 XTND Filters (EPSF, MacPaint, PICT, and TIFF)

Word Processor
* Max. Number of Pages Across - 9
* Max. Number of Pages Down - (65,534 / Number of Column per page) / Number of Pages Across
* Max. Number of Columns - 9
* Min. Space Between Columns - .01 inches
* Max. Number of Footnotes - 65,534
* Min. and Max. for Starting Footnote Number - 0 to 9999
* Number of Alignment Options - 4 (Left, Center, Right, and Full Justification)
* Number of Tab Marker Types - 4 (Left, Center, Right, and Decimal)
* Number of Tab Stops per Paragraph - 20
* Min. and Max. Line Spacing - 4 pt. to 255 pt.
* Formats Supported - 20 XTND Translators (Acta 3.0, AppleWorks 2.0-3.0, AppleWorks GS, EPSF, MacPaint 2.0, MacWrite 5.0, MacWrite II, MS-Word 3.0-4.0, MS-Word 4.0-5.0 PC, MS-Works 1.1, MS-Works 2.0, PICT, RTF, Text, TIFF, WordPerfect, WordPerfect 4.2-5.0 PC, WriteNow, and WriteNow NeXT.)

Graphics Document
* Maximum Number of Pages - 9999 across or 9999 down with a total of 32,767.
* Number of Tools - 7 (Line, Rectangle, Rounded Rectangle, Oval, Arc, Polygon, Freehand)
* Max. Number of Points per Polygon - 8,192
* Max. Number of Points per Freehand Object - 8,192
* Number of Fill/Line Colors - 81
* Number of Fill/Line Patterns - 64
* Min. and Max. Line Width - .01 pt. to 255 pt.
* Number of Arrow Line Types - 3 (Start, End, and Both Ends)

Spreadsheet
* Max. Number of Cells - 256 Columns by 16,384 Rows = 4,194,304 cells
* Max. Number of Characters in a cell - 255
* Min. and Max. Column Width - 0 to 510 pts.
* Min. and Max. Row Height - 0 to 256 pts.

* Number of Page Breaks per Document - 65,536
* Number of Functions Available - 100
* Chart Types - 7 (Pie, Bar, Stacked Bar, Line, Scatter, X-Y, Scattered X-Y)
* File Formats Supported - 5 Internal Translators (Text, DIF, SYLK, AppleWorks 2.0 and MS-Works 2.0)

Database
* Max. Number of Records per Document - 32,767
* Max. Number of Fields per Document - 255
* Min. and Max. Number of Chars. in a Field Name - 1 to 63
* Number of Field Types - 6 (Text, Number, Date, Time, Calculation, and Summary)
* Max. Number of Chars. in a Text or Number Field - 510 chars. minus 20 for each style change in the field.
* Max. Number of Chars. in Calculation or Summary Field Formula - 254
* Number of Available Functions - 91
* Max. Number of Layouts in a File - 32,767
* Min. and Max. Number of Chars. in a Layout Name - 1 to 31
* Types of Layouts- 5 (Standard, Columnar, Labels, Blank, and Duplicate)
* Max. Length and Width of Layout - 1 printed page (currently uses objects that extend below)
* Number of Layout Parts - 5 (Header/Footer, Sub-Summary, and Leading/Trailing Grand Summary)
* Max. Number of Columns in a Layout - 12
* Max. Length of a Match Records Formula - 255 characters
* File Formats Supported - 5 Internal Translators (Text, DIF, SYLK, AppleWorks 2.0 and MS-Works 2.0)

Communications Documents
* Max. Number of Open Documents - 1
* Max. Memory of Log Window - 2,978 lines of 9 point or 2,184 lines of 12 point text.
* Number of Included Tools - 6 (Apple Modem, Serial, Text, XMODEM, TTY and VT102)

ClarisWorks: Fields are not Placed on the Grid

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
Fields are not automatically placed on the same grid when creating a new layout or inserting a field. This can make manual field placement difficult when the Autogrid is on. Here are a few alternatives that will make it easier to manipulate your fields:

Select all of the fields and Choose Align to Grid. Continue to work with the Autogrid on.
- or -
Choose Autogrid Off if it is currently on and use the Align Objects... command to make sure that objects are perfectly aligned.

Locking a field will allow you to align objects more percisely for placement purposes.

Perfect alignment is crucial for Slide Objects to work.

FileMaker Pro: ClarisWorks Feature Comparison

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
FileMaker Pro 2.0 adds the following features in comparison with ClarisWorks 2.0:

Multi-user/Networking
Larger Disk-Based Files (up to 32 mb)
Larger Text Fields (up to 64,000 characters)
Repeating Fields
Picture, Sound and QuickTime Movie Fields
Multi-Line Calculation Fields
Change Ordering of Fields in Define Dialog
Print Field Definitions
User definable buttons
Powerful Scripting Capabilities
File Lookups
Pop-Up Menus, Check Boxes, and Radio Buttons
Number, Auto-entered Data, Value Verification.
Larger Layouts
Edit Paper Sizes
Passwords
Sliding Part Up ("Also reduce the size of the enclosing part")

In addition to the list above, FileMaker Pro 2.0 adds the following features to ClarisWorks 1.0:

Pop-Up Lists
File Import Mapping
Precise Object Sizing with Size Box
Entry Options: Creation Date/Time, Modification Date/Time, Creator Name, Modifier Name, Serial

ClarisWorks: How the Field Format Command Works

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
In versions of ClarisWorks through 3.0, the Field Format command was not implemented for text fields or calculations that are formatted to return a text result. Because of this, the Field Format command is not available when a text field is selected.

Text fields are formatted by selecting one or more fields and choosing the desired Font, Size, Style, Text Color, Alignment, and Spacing attributes from the Format menu.

In ClarisWorks 4.0, the Field Format command is available regardless of the field type selected. The options in the dialog box will change, depending on the field type, to show text, number,date, or time formatting options. As in all previous versions of ClarisWorks, to change the text formatting attributes (font, size, etc.) of non-text fields, you must choose the desired options from the Format menu. In all cases, line spacing and text alignment can only be changed using the Format menu.

MacDraw II, MacDraw Pro and ClarisWorks: Feature Comparison

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
MacDraw II adds the following features to ClarisWorks 2.0:

Multiple Object Based Rulers
Posted Notes
Unlimited Layers
Object Libraries
Adds Lower, Upper, and Title Styles
Set Named Views of the Drawing
Put Custom Pen Sizes in Menu
Free Rotation to any Angle
Edit Rotated Text
Customizable Dashed Lines
Customizable Arrow Heads
Autosize Lines that Display their Length
Document Size Grows to Show Entire Drawing
Fit to Window Command
Corner to Corner or Center to Corner Drawing Methods
Spell as you Type
Ability to Print with either Color or Black and White Patterns

In addition to the list above, MacDraw II adds the following features to ClarisWorks 1.0:

Rescaling Feature
Presentation Support
Custom Font Styles in Menu
Pattern Editing
Show Size of Objects
Spell Check Selection

MacDraw Pro 1.5 adds the following features to ClarisWorks 2.0:

MacDraw II Features
More Color Support
Precise rotation
Scale rulers
EPSF write (as well as read)
Letter Spacing Control (kerning)

In addition to the list above, MacDraw Pro adds the following features to ClarisWorks 1.0:

Gradients
Bezier Curves

MacWrite II/Pro: Feature Comparison

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
Compared with ClarisWorks 2.0:

MacWrite II adds:
Endnotes
Hide Pictures Command for speed
Merge Commands (conditional mail merge)
Ability to merge to a new document
Ability to Left/Right Headers and Footers
Word Underline, Double Underline, Lowercase, Uppercase, and Small Caps styles
Larger Type (up to 500 pts vs. 255)
Find/Change character styles
Hyphenation Control
Spell as you type
Allows you to Save Selection only
Allows Page # of Total format
Option to turn off time/date updating
Page Breaks command when using Multi-Column Document

MacWrite Pro adds:
MacWrite II features, plus:
ADDit Modules
Text wrap-around irregular bitmap images
Fixed Frame Locations
Text and Sound Notes
Paragraph Style Sheets
32K Headers and Footers
Auto Save
Auto Backup
Graphic Cropping
Manual Tracking Control
Text Palette
Mouse controllable Page margins/ guides
Document Statistics
Sections
Multiple Headers and Footers
Custom character spacing

ClarisWorks: Resizing or Scaling Multiple Objects

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
There are two ways to resize multiple objects at a time in ClarisWorks 1.0:

1. You can select the objects and choose Scale Selection to scale them by a specific percentage.
2. You can select the objects, choose Group, and then resize them using one of handles of the new grouped object. Then choose Ungroup once they've been resized. This method cannot be used with database fields because you can't group fields with other objects.

ClarisWorks 2.0 allows multiple object resizing. In addition, choosing Object Size from the Options menu will show a pallette which allows you to resize objects by selecting them and specifying a dimension.

Claris Cad: Crashing when Opening Arrows or Line Styles Dialogs

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
Certain files converted from DXF crash when the "arrows..." or "line styles..." dialogs are accessed. This is caused by information regarding arrows not being converted exactly correctly. The issue does not cause a distortion of the existing arrows in the file, but prevents arrows from being modified because the application unexpectedly quits when accessing arrows.

The way around this issue is:
1. Copy and paste the information to a new Claris CAD file. This can be cumbersome if the document has several layers.
2. Save the document as a MacDraw II 1.1 file. Then re-open the file and save it back into Claris CAD format. This is less cumbersome than option 1, but can cause issues for users with arcs.

The arcs may come back into Claris CAD slightly smaller than they were before. Please have users check for this issue if they choose to use option 2.

Partitioning a Hard Disk with the Apple IIe Card 2.0 in the Macintosh LC

The IIe Startup Disk mentioned in this article can be downloaded from the Apple Support web site, Apple Software Updates collection.
This article has been archived and is no longer updated by Apple.
The Macintosh LC's Apple IIe Card software is only supported by Apple with version 6.0.8 of system software. (However there are no known problems with system 7.0 or 7.01) . If you have a different version of Macintosh system software installed on your hard disk or if you don't use a hard disk at all, you can use the disk labeled "IIe Startup Disk" to run Apple IIe programs. In addition, the ProDOS file system, requires version 6.0.8 of the system software.

The process of creating space for your Apple IIe files is time-consuming, and requires you to erase your hard disk. Also, you cannot store both Apple IIe files and Macintosh files on the same hard disk unless you reserve part of the hard disk for IIe files, i.e. partitioning. Once again, this procedure requires that you erase all information stored on the hard disk. So be sure and back up your hard disk before beginning the partitioning process.

The following procedure describes how to set aside 10 MB for Apple IIe files:

1. Shut down the Macintosh.

2. Insert the IIe Installer Disk into the built-in disk drive.
3. Start up the Macintosh.
4. Open the IIe Installer Disk by double-clicking.
5. Double-click the Apple HD SC Setup icon.
6. Click the Partition button. (A screen appears with all your partitioning options.
7. Click "10 MB ProDOS, Maximum Macintosh," the click OK.
8. A dialog box appears to confirm that you want to erase your hard disk.
9. Click OK.
10. The program takes a few minutes to partition the drive and then asks you to name the new Apple IIe partition. (Remember no more than any combination of 15 numbers and letters.)
11. Type a name and then click OK.
12. Then QUIT.

You now have two icons representing the same hard disk. The new icon, with the symbol for the Apple IIe on it, represents the space reserved for your Apple IIe files. The original icon represents
the rest of the hard disk, which is reserved for Macintosh files.

IMPORTANT:

Drag the BASIC.SYSTEM icon and the PRODOS icon to the new Apple IIe partition.

You can now restore the contents of your hard disk by:

1. Ejecting the IIe Installer disk.
2. Insert one of your backup disks into the disk drive.
3. Copy all the Macintosh files and folders back to the Macintosh partition of the hard disk.

MacDraw Pro: Documentation / Publication Issue

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
Documentation / Publication Issue

The initial shipment of MacDraw Pro was shipped with an incorrect version of the Dandie Candie tutorial file. Specifically, several items that were supposed to be grouped were left ungrouped. If a user attempts to step through the tutorial instructions in the MacDraw Pro Getting Started manual using the Dandie Candie file, the results will not be what the manual states. Listed below are the errors a user will encounter using this version of the Dandie Candie file.

* Page 2-19 #2: The manual states the "You can also click the right and left arrows on the Style bars to scroll the bar one cell at a time." This is not true.

* Page 2-38 #1: The tutorial tells you to choose Move Backward only once when, in fact, you have to choose Move Backward 6 times to achieve the effect illustrated in the examples.

* Page 2-39 #4: Same issues as pervious. Must choose Move Backward 6 times.

* Page 3-23 #1: It tells you to choose Show Size here but this option is not available under the View menu because the Size bar is already shown when the document is first opened (Hide Size is shown).

* Page 3-24 #4: This step tells the user to click on a graphic and move it up 1/4 inch. The issue here is that the object in question is not grouped! The example clearly shows this object grouped but it'is not in the provided sample file. This could be very confusing to a new user. You need to drag around the object and group it before performing this step.

* Page 4-17 #1: It mentions 2 additional gradients added to the palette but the sample file actually contains 10 additional gradients.

* Page 4-18 #3: It says to click the first gradient cell in the bottom row. Due to the additional gradients, however, it should be the first gradient in the 3rd row (there are 4 rows).

* Page 4-19 #6: Second gradient in the bottom row should be the second gradient in the 3rd row (same issue as above).

* Page 4-25 #13: It says to open the stationary document just saved but you cannot see it because the Show popup menu in the Open dialog box is still set to show only Library files (from step #1 on page 4-7).

ClarisWorks: Installing from an AppleShare File Server

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
To install ClarisWorks or MacDraw Pro (or any other software that installs using the Apple Installer program) from an AppleShare file server, do the following:

1. Copy all the disks to the server, creating folders on the server. Do not rename these folders.
2. Move the resulting folders into a common folder.
3. Open the Installer folder. Option-drag the Installer Scripts file to the common folder, which copies this file.
4. Also option-drag the Installer file to the common folder.
5. To install, double-click the Installer Scripts file in the common folder.

Claris Resolve: Open Window Limitation

How to get around the 32 open window limitation in Claris Resolve. Not recommended for the faint of heart (or for those not experienced with ResEdit.)

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
Claris Resolve 1.0vX is limited to opening 32 windows at a time. This would be a reasonable limitation if weren't for the fact that when Claris Resolve opens a WingZ file with scripts, it will create a new window for each script it encounters that is _attached_ to the WingZ file. If there are more than 32 such scripts, Claris Resolve will stop opening the file with a "Too many windows" dialog box.

Claris Resolve 1.1 has a resource (MxWn) which can be edited to allow more than 32 windows to open. Increasing this setting, however, will require that more memory to be allocated to the program. This is because more window handles must be allocated at startup to reduce the danger of memory fragmentation. The resource can be edited with a utility such as ResEdit and consists of a single hexadecimal number (20 Hex = 32 Decimal) representing the maximum number of windows allowed.

Extensive testing beyond 32 windows was not performed on this product so we do not guarantee this procedure, however, no issues were encountered in the limited testing that was performed. This procedure should be used AYOR (At Your Own Risk).

ClarisWorks: Opening or Inserting Non-ClarisWorks Graphics

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.

Issue:
When double-clicking on one of the art files, the file does not open. Instead, an alert appears on screen that says something like "The application that created this file could not be found, is busy or is missing".

Solution:
Double-clicking on a file in the Finder can only open the file in the application that created it. The art files were created in other programs (MacPaint, etc.), so double-clicking on them won't open them into ClarisWorks.
To open these files into a new document, either:
1- Drop-launch the file (drag the file icon onto the ClarisWorks applictication icon), or
2- Launch ClarisWorks, then use the Open command in the file menu to open the file
To open these files into an existing document, use the Insert Command

Issue:
When using the Open command, the Pegasus Art file is not listed in the Open dialog box.

Solution:
(ClarisWorks 1.0): In the Open dialog box, click the Import Options flag so that it points down. Then Click the Drawing button.
(ClarisWorks 2.0): In the Open dialog box, click the Document Type popup menu and select Drawing for the file type.

The Pegasus Art file, and other non-Clarisworks graphics files (MacPaint, TIFF, etc.) should now list in the scroll bar. If not, be sure that you are viewing the correct folder. The folder name is listed in the popup menu above the scroll bar. If you are viewing the proper folder and the graphic files are still not listed in the Open dialog box, try the solutions listed next.

Issue:
When Inserting the Pegasus Art for the tutorial (ClarisWorks Getting Started, Page 6-26), the inserted art takes up the entire screen, covering the fields behind it. The selection handles are not visible on screen, what is happening?

Solution: ClarisWorks is using an old MacPaint filter in your Claris Translators folder. Remove the filter called "MacPaint" and keep the one called "MacPaint 2.0". The Installer does not remove this older filter during the installation process.

FYI: When the inserted art takes up the entire screen, choose "Scale Selection" and reduce the inserted object by 50% - the logo itself is in the upper left corner of a solid large white object, which covers up all the fields in the layout and therefore also in browse. Select the object and choose "Send to Back" under the arrange menu.

Manual Correction: In addition, on page 4-13 of the ClarisWorks Getting Started manual, the Open Document dialog box lists the file "Pegasus Art" and instructs the user to open the file. After step 1, the instructions should tell the user to click on the Import Options flag, then click on the Graphics radio button. "Pegasus Art" will then be listed as an importable file.

Issue:
When Inserting (using the Insert command) the Pegasus Art for the tutorial, the Pegasus Logo file does not show up in the Tutorial folder.

Solution: First make sure the Pegasus Logo file is in the Tutorial folder by opening the folder in the Finder. If the file icon is there, try the following:
1. Locate the file called XTND Translator List and delete it (System 7: it's in the Preferences folder inside the System Folder; System 6: it's in the Claris folder inside the System Folder).
2. Reinstall the translators from the original ClarisWorks disks: Insert the Installer disk; double-click the Installer icon; click the Customize button, choose the translators option, then click Install).
3. An INIT or extension file may be conflicting with ClarisWorks. If your computer is running System 7, hold down the shift key while restarting the computer. This will turn extensions off. Try opening or inserting the file into the ClarisWorks document again. You can use your extensions again by restarting the computer without holding down the shift key.

Hard Drive SCSI Termination Power

I'm experiencing a startup problem with Mass Microsystem's DataPak attached to my Macintosh. Sometimes I could start up fine with or without the DataPak turned on. Other times, the system hung until the DataPak was turned on.

What's going on?

This article has been archived and is no longer updated by Apple.
The SCSI bus requires termination power on the bus to provide clean, quality SCSI signals. Mass Microsystems' DataPak supplies its own termination power to the SCSI bus. (This characteristic is also common to early SuperMac DataFrames.) Other SCSI devices that we checked use the termination power provided by the Macintosh.

When a SCSI device provides its own termination power, the SCSI bus signals may be corrupted when that device is powered down because it leaves the SCSI bus unterminated. An unterminated SCSI bus can cause startup problems because of noise on the bus.

Sometimes when a SCSI device that supplies its own termination power is powered down, the Macintosh will still start up because the SCSI bus signal is clean enough for the startup process to take place. However, there is no assurance that the bus signals will stay clean and uncorrupted since the SCSI bus is not properly terminated in this situation.

SCSI devices that use the termination power provided by the Macintosh do not have to be powered on for the SCSI bus to be properly terminated. The termination power from the Macintosh provides the correct termination to the SCSI bus.

Claris Resolve: Insert and the Sum Function

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
This problem has been corrected in 1.0v3.

Inserting a column on a worksheet that uses the Sum() function will sometimes cause the range used in the function to be incorrectly adjusted.

Example:
* Put some values into B2..B4.
* Put the formula '=Sum(B2..B4) into C5.
* Put some values into D2..D4.
* Put the formula '=Sum(D2..D4) into E5.
* Select column E and choose Insert from the Edit menu (or Command-I).
* The formula in column C now references A1..A4.

ClarisWorks: Printing in Best or Faster on the ImageWriter and Other Options

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
This is corrected in 1.0v3.

In ClarisWorks 1.0v1, you cannot take advantage of "Best" mode quality on ImageWriter printers.

Even if "Best" quality is selected, the ImageWriter or ImageWriter LQ will print at the lower resolution "Faster" quality. Also, other applications you use after printing from ClarisWorks may behave in the same way until you restart the computer, or change printers in the Chooser.

ClarisWorks 1.0v2 only enables the use of best and draft modes. This is because ClarisWorks 1.0v2 prints to the ImageWriter at the highest resolution possible. This precludes ClarisWorks from using options available to the ImageWriter. So in ClarisWorks 1.0v2 faster printing, tall adjusted and 50% reduction will not be available when printing to the ImageWriter I/II.

Claris Resolve: Script Command for Removing a Menu Separator

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
The usual procedure for deleting a menu item is the use the three commands SELECT MENU, SELECT MENUITEM and REMOVE MENUITEM as follows:

SELECT MENU "MyMenu"
SELECT MENUITEM "MyMenuitem"
REMOVE MENUITEM

Menu separators, since they do not have a name, are added and deleted differently. You need to explicitly select the menu separator by using its number in order to delete it properly. The menu item number is determined by its position on the menu. In a standard Edit menu, for example, Undo would be 1, the menu separator 2, Cut 3 and so forth. To delete a menu separator, you need to use the SELECT MENU, SELECT MENUITEM NUMBER and REMOVE MENUITEM commands:

SELECT MENU "MyMenu"
SELECT MENUITEM NUMBER 2 {Here we are referencing the menu by its number which corresponds to its position on the menu (first item is 1 second item is 2, etc...)}
REMOVE MENUITEM

MacDraw Pro: EPSF in PageMaker Missing Right Side

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
This is fixed in MacDraw Pro 1.5

PageMaker 4.0 has a issue with some EPSF files from MacDraw Pro 1.0. If an EPSF from MacDrawÊPro is placed in PageMaker 4.0, and the image has a rectangular border with a thin pen weight, the right side of the border will be missing in PageMaker. The top may be missing also. To recreate this, draw a box and give it a very thin pen weight, say .01 pt. Save as EPSF. Place into PageMaker. The EPSF will display and print incorrectly. The same image will display and print correctly from MacDraw Pro, PowerPoint, Persuasion and Freehand. One workaround seems to be to make the pen weight for the border thicker, say 1 point.

Claris Resolve: Highlight Color Does Not Change

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
Claris Resolve always uses black as the highlight color, and does not use the system highlight color.

This was a purposeful design decision due to the fact that custom highlights can produce bizarre affects if a custom color is applied to the background or the text.

There is currently no workaround.
Published Date: Feb 18, 2012

Claris Resolve: How to Convert Fractions into Numbers

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
Often, stock data you obtain from information services, or data entered into a spreadsheet will be in fractional format. For example, "38 3/8" to mean 38.375.

Here is a formula that will take any fractional expression of a number in cell A1 and convert it to decimal format that Claris Resolve can use:

= Value(Left(A1,Find(" ",A1,1)))+(Value(Left(Right(A1,Len(A1)-Find(" ",A1,1)), Find("/",Right(A1,Len(A1)-Find(" ",A1,1)),1)-1))/Value(Right(Right(A1,Len(A1)-Find(" ",A1,1)), Len(Right(A1,Len(A1)-Find(" ",A1,1)))-Find("/",Right(A1,Len(A1)-Find(" ",A1,1)),1))))

Here's how we built the formula:

raw text expression of number (a) = "38 3/8"
whole part of the number (w) = Left(a,Find(" ",a,1))
fractional part of the number (f) = Right(a,Len(a)-Find(" ",a,1))
numerator in the fraction (n) = Left(f,Find("/",f,1)-1)
denominator of the fraction (d) = Right(f,Len(f)-Find("/",f,1))
decimal version = Value(w)+(Value(n)/Value(d))

To find "w" we use two Claris Resolve text slicing functions to take the portion of the text string that appears before the first space in the number. "f" takes everything after the first space. "n" takes everything before the slash ("/") in "f" and considers it the numerator. "d" takes everything after the slash in "f." We put it together in "d," which has to convert the text values returned by the components and convert them to arithmetic values.

The first formula above is just everything put together.

ClarisWorks: PowerBook 140 & 170 Installation Issues

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
The PowerBook 140 & 170 cannot read part of the ClarisWorks HyperTour Disk that ships with 1.0v1. As a result, an Easy Install on these machines will result in a "failed" installation and clicking on "Quit" may cause the Installer to crash.

Since the HyperTour is the disk with the largerst single file, it failed more often due to size and how it was duplicated. When the issue was found, the duplication process was altered to avoid disk fragmentation and the Easy Install process does not include the HyperTour by default.

Separately, several vendors have reported that the PowerBook can't read certain floppy disks and this is caused by emissons from the screen. However, you should be able to install ClarisWorks by:

1. Turning the brightness control down or off and repeating installation.
2. Using a non-PowerBook Macintosh to copy the HyperTour disk onto another disk and installing from the copy.
3. Using Custom Install, install the HyperTour.

HyperCard 1.2.2: Can‘t Print More Than 127 Pages

I am having a problem printing from HyperCard v1.2.2. Specifically, it seems to be the "printing more than 127 pages" problem that others have noticed in earlier versions of HyperCard.

The "Now preparing page x..." counts up to 167 and down, printing pages 167 through 39, and then it terminates as if completed (167 - 39 = 128). I compacted the stack before printing, and I tried MultiFinder as well as Finder.
This article has been archived and is no longer updated by Apple.
This is caused by a problem in HyperCard 1.2.2. As of May, 1990, there is no solution to this problem.

Claris Resolve: Function Name Translation Utility

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
The following describes a Claris Resolve utility that will simplify the modification of Claris Resolve scripts for compatibility between various language versions.

ISSUE: Function names in localized versions of Claris Resolve are partially translated. Scripts created in different language versions may not work error free in another language version of Claris Resolve. For example, a script created with French version that calls French functions, will not work error free when opened in German or English versions.

SOLUTION: Resolve Function Name Translation Utility (RFNTU). The RFNTU will simplify the conversion of scripts from one language version to another by automatically translating function names.

AVAILABILITY: We expect the RFNTU to be available by early '92 or sooner. Countries with localized versions of Claris Resolve will be supplied.

Most customers will not be concerned by this issue. This issue only affects customers who are creating scripts AND are involved in a multilingual environment (e.g. Canada & Switzerland).

MacDraw Pro: Crashing with Text Pasted from PageMaker

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.

Text copied from PageMaker 4.0 with the text tool, then pasted into a text block in MacDraw Pro 1.0 will crash the computer. The following steps recreate the issue:

1) Type a text block with 2 or more hard returns in PageMaker 4.0
2) Copy the text with the text tool (you must select the text with the text tool, not with the selection arrow)
3) Copy to the clipboard
4) Open MacDraw Pro
5) Click the text tool and click in the document (to create either a caption or paragraph text block.
6) Paste, then crash.

The issue can be avoided by pasting into MacDraw Pro without pasting into a text block.

When text is pasted from PageMaker, it pastes as multiple text objects.

This article has been archived and is no longer updated by Apple.
This issue has been corrected in Claris Resolve 1.1

Claris Resolve will crash or lock up when saving a file as Excel 2.2 if the worksheet contains a function that includes more than 32 parameters. For example, the formula:

=Sum(A1,A2,A3,A4,A5,A6,A7,A8,A9,A10,A11,A12,A13,A14,A15,A16,A17,A18,A19,A20,A21,A22,A23,A24,A25,A26,A27,A28,A29,A30,A31,A32,A33,A34,A35)

Claris Resolve: Default Font has Changed from Geneva

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
Claris Resolve uses the default application font (Geneva) as the default font for new worksheets. Sometimes, however, the system parameter that defines this font gets lost. When this occurs, Claris Resolve will generally use Chicago in the default point sizes.

To correct this situation, you need to Zap the PRam. This is performed several different ways depending on the version of the operating system and machine.

* Under System 7 - Hold down the Option-Command-P-R key sequence while the machine is booting. You must be very quick since this process occurs very early in the boot process. If performed successfully, the machine will sound a restart chime just as the Happy Mac icon appears then restart.

* Under System 6 - Highlight the Control Panel option under the Apple menu but don't release the mouse. Hold down the Shift-Option-Command sequence while releasing the mouse. You will get a dialog asking if you want to zap the PRam, click yes. The reason this procedure is so awkward is due to the fact that the option key will hide all the DA's (including the Control Panel) if it is held down when displaying the Apple menu. For this reason, you must wait until the Apple menu is already displayed before pressing this key.

* On a Macintosh Plus - The above two procedures work for all machines introduced since the Macintosh Plus. For the Macintosh Plus and older machines, zapping the PRam is simply a matter of removing the battery located above the power switch on the back of the case. You should properly shut down and unplug the machine before attempting this operation. Make note of the battery orientation prior to removal to ensure proper reinstallation.

MacDraw Pro: Gradients not Printing to Personal LaserWriter LS

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.

Gradients inside ovals or circles don't print to the Personal LaserWriter LS when the focal point of the gradient is perfectly horizontal or vertical. Instead, the ovals will print with no fill. The issue happens using versions 1.0 and 1.1 of the Personal LW LS driver (aka 7.0 &b 7.1) and occurs due to a known issue in the printer driver. The current workaround is to edit the gradient so that the direction of the ending color is neither perfectly horizontal or vertical. Then reapply that gradient to the object.

Claris Resolve: Invalid Results from the Count Function

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.

The count function will not always return valid results if the range supplies as its argument contains other formulas. For example, if the range B1..B5 has a formula such as:

=If(A1 < 10,"",A1)

And cell B6 contains the function:

=Count(B1..B5)

Claris Resolve will always return the value 5, even if some of the cell function's return nothing. Even if a formula returns nothing, the flag used by the count function still indicates that a value was returned (in fact, a value is returned - a null string).

One work-around is to use the database function DCount.

NOTE: Some users have complained that the count function in Excel does not behave this way. The Count function in Claris Resolve is distinctly different from Excel's in that is will correctly count text as well as number cells. Excel only counts numbers and ignores text cells.

Claris Resolve: Using Custom Functions

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
Custom functions can be placed in a stand-alone script or in the Worksheet script of the document using the formula.

In both cases, the you must reference the name of the document along with the function. For example, if you create a script called "myScript" into which you include your "myAdd" function, you would reference it in the cell as follows:

=myScript:myAdd(2,2)

If the script name has spaces in it, you must surround the reference (not including the arguments) with single quote marks:

='My Script:myAdd'(2,2)

If the function is in the worksheet script, you need to use the second method, replacing the script name with the worksheet name (this tells Claris Resolve to look for the function in a script instead of its built in functions). For example, if the worksheet name is INTERNAL SURVEY, the reference would read:

='INTERNAL SURVEY:myAdd' (2,2)

Lastly, if your function is in an external script file, that script file needs to be open when using the function. Use the GET SCRIPT command to load, but not run, the script into memory. This command will leave the script in memory until it is removed with the REMOVE SCRIPT command or the program is quit.

If you want to automatically load this script, place your GET SCRIPT command(s) in a script called "Startup" and place it into your Resolve Scripts folder. This script will automatically run when Claris Resolve is launched (if you are using the sample scripts provided with the program, follow the directions in the Read Me file to modify the included Startup script).

Claris Resolve: Converting Excel Documents with External References

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
Claris Resolve support external cell references and will convert them when opening an Excel (2.2) document. In order for this to work properly, however, you need to convert the worksheets in the correct order.

* First, convert the worksheet that is being referenced (not the worksheet that has the external references but the one from which the data is being looked up).
* Save this document with its original name. Do not change the name or leave the "(Converted)" appendage in the name.
* With the first worksheet(s) still open, convert the worksheet that contains the external references.

It is neccessary to open the worksheets in this order because Claris Resolve will assume the external references are script names if the referenced worksheet is not open at the time of conversion. Script references and external references look essentially the same but are stored and treated differently.

If you have a worksheet that was not converted properly, the easiest way to fix the issue is to reconvert the document using the above procedure. If the original documents are no longer available, open all the worksheets involved (referencer and referencee) and make some small change to each of the cell formulas that display an error message (adding then deleting a space after formula will usually suffice). This will cause the formula to be re-parsed. If the referenced worksheet is open, therefore, it will correctly identify it as an external reference.

MacDraw Pro 1.0v1: 4-Disk Configuration

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
MacDraw Pro is now shipping as a 4-disk set instead of the original 6 disk set. Programs with serial numbers after 0001086200 are the four-disk set.

Pertinent Details:

1. The version number is still 1.0v1.
2. The four disks are named Help, Reference, Installer and Program. The files are compressed with Stuffit. The Installer installs the compressed files, then decompresses them on the hard disk. Thus, the customer will need a little more free hard disk space to install everything, as there has to be enough room to hold both the compressed and decompressed files on the hard disk.
3. To help with the hard disk space issue, the Easy Install button no longer installs everything. It does not install the HyperTour, Color Palettes, Help files or Printing support. To install the these files, you must use the Custom Install feature in the Installer.
4. The disks from the 6-disk set are not installable or usable in any way with the 4-disk set (and vice versa).

4-Disk Set Disk Contents:
Installer
* Installer
* Read Me (and Teach Text)
* Tutorial Files
* Sample Files
* 32-bit QuickDraw

Program
* MacDraw Pro (application)

Help
* Claris Help System
* MacDraw Pro Help
* MacDraw Pro HyperTour

Reference
* Claris XTND System and Claris Translators
* LaserWriter Driver files
* Spelling Dictionaries
* Color and Gradient palettes

Claris Resolve: Using Named Ranges in Scripts

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
You can use a named range to reference a location on your worksheet. The worksheet has to be open when you compile the script, however, or the Claris Resolve compiler will assume it's a script. If this occurs, you will get a "Missing Script" message when the script is executed.

Example:

* Create a worksheet named "MyWorksheet".
* Save it to the root directory of your hard disk.
* Select the cell or your choice.
* Choose "Name Ranges..." from the Format menu.
* Type "myrange" into the name field.
* Click OK.
* Save it to the root directory of your hard disk.
* Close the worksheet.
* Choose "New Script" from the Script menu to create a new script.
* Enter the following commands (replace <HD> with the name of your hard disk:

Open "<HD>:MyWorksheet"
Put 999 into MyWorksheet:myrange

* Save the script to the root directory of your hard disk.
* Choose "Run" from the Script menu.

You should get an error saying "Missing Script". This is because the script was compiled with the worksheet that contained the named range closed. Remember that scripts are compiled when you save, compile or run them.

To correct the problem:

* Open the worksheet named "MyWorksheet".
* Bring the script window to the front by choosing its name ("Script1") from the View menu.
* Choose "Compile" from the Script menu.
* Close "MyWorksheet" leaving the script open.
* Choose Run from the Script menu.

The script should now run correctly with no errors since we re-compiled it with the worksheet open.

ClarisWork: About Version 1.0v2 Macintosh, Release Notes

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
The update consists of a single disk containing: ClarisWorks, a new ClarisWorks Translators file and a Read Me file.

Changes in 1.0v2 include:

1. Removed low memory crashing when switching to Page View.
2. No longer crashes while opening MS-Works 2.00e Spreadsheet files.
3. Prints in Best mode (144dpi) to the ImageWriter.
4. Allows opening Communications Stationery files from Finder.
5. Now recognizes AppleWorks DB and SS files when copied over AppleShare, or Finder-copied using the software that comes with the Mac LC //e emulator card.
6. No longer reads empty cells as zero from AppleWorks spreadsheet files.
7. No longer installs HyperTour during Easy Install, must use Custom Install.

Here is the beginning of the Read Me file:

Thank you for choosing ClarisWorks. On this disk you will find the latest versions of this Read Me file, the ClarisWorks 1.0v2 application, and the ClarisWorks Translators file.

To install ClarisWorks 1.0v2 simply drag the ClarisWorks icon from this floppy into your ClarisWorks folder thereby replacing the existing application. If you originally installed manually, i.e. without using the Installer Script, you should replace the older version wherever you installed it. Similarly, to install the new ClarisWorks Translators file drag the ClarisWorks Translators icon into the Claris folder in your System Folder. It does not go in the "Claris Translators" folder.

We're excited about this new approach to integrated software, and we hope you enjoy using it. Some late-breaking information couldn't be included in the printed manual, so we're providing it here.

Please read this file carefully. It contains several important tips that will make it easier for you to use ClarisWorks. You may even wish to print this document for future reference.

ClarisWorks: Unindented Paragraphs Printing Indented

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
This issue is corrected in version 1.0v3.

The first line of a paragraph will print indented when the paragraph follows a blank line. The indentation is a space or so for each blank line preceding the paragraph. This issue happens under the following conditions:

* StyleWriter, ImageWriter or Personal LaserWriter LS, regardless of driver version, using TrueType fonts
* Version 1.0v1 or 1.0v2 of ClarisWorks
* Worst with System 6.x and the TrueType Init.

Workarounds for 1.0v2 and earlier:
Type a space on each blank line. The space character can be typed manually on each blank line, or can be inserted by using the Find/Change command. To do this, find \\p\\p, replace with \\p{space}\\p. (In other words, find two returns, replace them with a return-space-return).

Another workaround is to use ATM with Postscript fonts or plain bitmaps instead of TrueType fonts.

Some customers have reported that using System 7 and turning on Fractional Character Widths has lessened the issue. However, this does not solve the issue for most people.

Claris Resolve: About Version 1.0v3, Release Notes

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
Resolve 1.0v3 Release Notes, December 1991

Improved file handling
¥ Claris Resolve 1.0v3 correctly saves worksheets with text fields containing more than 32K of data.
¥ Lotus 1-2-3 files with the maximum amount of text entered in a cell (240 characters) import correctly.
¥ The Auto Save feature now correctly remembers the time interval specified in the "Auto Save..." dialog box.
¥ SYLK files with row and column formatting now import correctly.
¥ SYLK and Excel 2.2 files created by non-U.S. versions of Excel now import correctly.
¥ Worksheets saved in Excel 2.2 format import correctly into non-U.S. versions of Excel.

Improved worksheet editing
¥ Formulas adjust correctly when a range is cut from one area of the worksheet and pasted to another area that already contains data.
¥ Formulas adjust correctly when rows and columns are inserted or deleted from the worksheet.
¥ Setting the width of columns containing right-aligned text to 1 pixel no longer causes Claris Resolve to freeze.
¥ Claris Resolve 1.0v3 correctly interprets time and date entries when used with non-U.S. versions of the Macintosh Operating System.
¥ Formula references are now correctly adjusted when you use the "Transpose..." operation in the Matrix dialog box.
¥ The Cell Size, Text Field Info, and Other (Text Size) dialog boxes now accept units other than inches (for example, millimeters).

Miscellaneous
¥ A PVAL Apple Event specifying a range beyond the bounds of the worksheet will no longer cause a crash.
¥ Old script buttons are now restored when compiling a converted worksheet.
¥ Claris Resolve can correctly determine the number of colors available in a hidden (off-screen) window.
Published Date: Feb 18, 2012

ClarisWorks: WYSIWYG Menus from Now Utilities

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.

There is some confusion between ClarisWorks 1.0 & 2.0 and WYSIWYG Menus 3.0.2 from Now Utilities. The 4.0.1 update of WYSIWYG Menus remedies the confusion.

To illustrate the issue:

1) Create a new ClarisWorks word processing document. Note the current font.
2) Create a second word processing document.
3) Change the font.
4) Close the document.

When the Font menu of the first document is selected, it says Times and displays in Times as it should, however, now when you select the Size or Style menus, the menus are displayed in the font of the second (closed) document.

Published Date: Feb 18, 2012

ClarisWorks, Draw, Impact: Translators or Comm Tools are Not Available

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
Translators and Communications Tools may not be accessible immediately after installing ClarisWorks, ClarisDraw or ClarisImpact under System 7. These files are sometimes left in the Installer Temp folder and will not be moved into their proper locations until you restart the machine. When the Macintosh starts up again, the installation will be completed by the Installer Cleanup Init which puts them where they need to be.

In addition, if you have restarted your machine, and the translators are still not available, check the following:

1. The Claris folder is in the System Folder, and is named Claris.
2. The Claris XTND System is in the Claris folder.
3. The Claris Translators folder is in the Claris folder.
4. The translator files are in the Claris Translators folder, and are not compressed by any compression utility software.

ClarisWorks Users Group (CWUG)

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
For more information, visit the ClarisWorks Users Group Web site at http://www.cwug.org or the CWUG forum on America Online (keyword: CWUG).

CWUG Information

Formed in 1991, CWUG is an independent support group with more than 14,000 members in the United States and 47 other countries all dedicated to helping ClarisWorks users.

ClarisWorks Journal

CWUG members receive the ClarisWorks Journal, a 24-page monthly newsletter that describes tips, techniques, and hints that help users get more from ClarisWorks. The ClarisWorks Journal includes other articles of interest to ClarisWorks users, including news of product releases and reviews of ClarisWorks enhancements and ClarisWorks-compatible software. CWUG works closely with Claris Corporation and Apple Computer to ensure that members get the latest information about ClarisWorks and easy access to help with their ClarisWorks issues.

Members Helping Members

CWUG members can get free, one-on-one technical support from their colleagues who volunteer for CWUG's Members Helping Members program.

CWUG publishes the names, telephone numbers, and e-mail addresses of 65 volunteers in the United States, Canada, and 18 other countries. Members call these volunteers to get answers to their ClarisWorks questions and ideas for their ClarisWorks projects.

This is a members-only service. If you are a CWUG member, the Members Helping Members (25k) database is available here in encrypted form. To obtain the key to extract the database send your CWUG ID number to CWUGbruce@aol.com with your request. We also publish updated lists in each June/July issue of the ClarisWorks Journal.

Public Domain Library

CWUG's comprehensive Public Domain Library offers more than 500 megabytes of ClarisWorks-compatible templates, fonts, graphics, utilities, and system software. We add to the library monthly and distribute the software on disks and through our on-line services. (Our license with Apple Computer prohibits us from distributing Apple software on-line. We distribute Apple products on disks only.)

Sales of public domain disks helps support CWUG; we immediately release all new software on disks. New software is posted on our electronic services approximately 90 days after it is announced in the ClarisWorks Journal.

Macintosh Display Card 8/24GC and Raster Ops Monitors

I have a RasterOps Colorboard 108 plus video card and a RasterOps 19-inch Trinitron monitor. I also have two 1) Does the Macintosh Display Card 8/24GC support the RasterOps 19-inch Trinitron monitor?

2) If I install the Macintosh Display Card 8/24GC but don't connect a monitor to it, will it accelerate the display on the RasterOps monitor?

This article has been archived and is no longer updated by Apple.
1) The Macintosh Display Card 8/24GC supports any display that meets one of the following specifications:

Sense pins 10 7 4	Display	Hor x Vert Pixels	Dot Clock	Vert Refrsh	Horiz Refrsh
0 0 1	Apple Portrait Display	640 x 870	57.2832	75	68.9
0 1 1	Apple Two-Page Monochrome Monitor	1152 x 870	100	75	68.7
1 1 0	12-Inch Apple Monochrome Monitor	640 x 480	30.24	66.7	35.0
1 1 0	13-Inch AppleColor RGB Monitor	640 x 480	30.24	66.7	35.0

0 - Grounded 1 - Not Connected

Note that sense pins 4, 7, and 10 are referred to as SENSE0, SENSE1, and SENSE2 in pinout tables for the video connectors.

None of the RasterOps 19-inch Trinitron displays meets the above specifications. One of their 19-inch Trinitron displays has a vertical refresh of 75Hz and a horizontal refresh of 60.241KHz. We do not think that this will work properly, but you can try it in the "Apple Two-Page Monochrome Monitor" mode.

Here are the pinouts for the Macintosh Display Card 8/24GC:

Pin	Description
1	Red Video Ground
2	Red Video
3	Composite Sync
4	SENSE0
5	Green Video
6	Green Video Ground
7	SENSE1
8	Not Connected
9	Blue Video
10	SENSE2
11	Composite Sync and Vertical Sync Ground
12	Vertical Sync
13	Blue Video Ground
14	Horizontal Sync Ground
15	Horizontal Sync
Shell	Chassis Ground

2) If no monitor is connected to the Macintosh Display Card 8/24GC, the card will, in effect, turn itself off and not accelerate the RasterOps display system. You can trick the card into thinking that a monitor is attached by grounding pin 4. This will cause the card to accelerate other displays in the system.

Claris Resolve: Cell Fill Color Changing when Clicking in the Cell

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
This issue has been corrected in Claris Resolve 1.1

There is a new bug introduced in Claris Resolve 1.0v3 that causes repaint issues under the following conditions:

* A cell the the left of the affected cell is filled with a color, and
* It contains right-aligned text.

If these conditions exist, clicking in any blank cell to the right (in the same row) will cause that cell to be painted the color of the cell to the left. This only occurs with blank cells.

This condition did not exist in 1.0v2.

To Duplicate:
Fill A1..A10 with text, right-aligned, and fill the cells with a color.
Click in any cell to the right on A1..A10.

Claris CAD & MacDraw II: Pasting Spreadsheets Into

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.

Excel:
Copying an Excel spreadsheet, then pasting into Claris CAD or MacDraw II results in misaligned columns. This is because Excel copies all the cells to the clipboard as tab-separated text. Claris CAD and MacDraw II read the tab column separators as spaces. The best workaround is to copy and paste each spreadsheet column separately. Then align the text objects in Claris CAD and MacDraw II.

Claris Resolve:
When copying/pasting from Claris Resolve to Claris CAD and MacDraw II, each spreadsheet cell pastes as a separate text object. Gridlines, if displayed in Claris Resolve, also paste into Claris CAD and MacDraw II. All the cells and gridlines paste as a group, which can be ungrouped. Thus, when pasted, the columns align correctly.

ClarisWorks, Impact: Calculated Cells Showing Round-Off Errors

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.

Issue:
A calculated cell (e.g. =300-299.73) that has a Number format of General may display as 2.6999999e-1 or 0.26999999999999999 when 0.27 is expected.

Solution:
Use Number... from the Format menu to format the cell as Fixed if you are using ClarisWorks. In ClarisImpact the Number Format... will be found under the Table menu.

Explanation:
Calculating the difference between two large numbers that is in the range of -1 to 1 may produce results that are slightly off. This is due to the fact that ClarisWorks relies on the Standard Apple Numerics Environment (SANE) for it's computations and there are some precision related issues in SANE that ClarisWorks does not correct for.

Another way to illustrate the issue above is:
A calculated cell (e.g. = 409.39 * .5) (the calculation result is 204.695) that has a Number format of General may display as 204.69 when 204.70 is expected. Following the above procedure will work but causes some issues.

The cell will display the desired figure, but when the contents of the formatted cell (formatted as 204.70) are included in another calculation, the real calculated number will be used (204.695). To avoid the possibility of a discrepancy between what is displayed and what is calculated, use the round function in calculated cells where rounding is desired. In the above example you would want to use the following formula - Round(409.39 * .5 ; the result is 207.70).

ClarisWorks: Can‘t Open Microsoft Works Stationery Files

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
This is corrected in 1.0v3.

ClarisWorks 1.0v2 and earlier are unable to open files that are saved from Microsoft Works in Stationery format. To open these files, open them in Works and then save them in normal format which ClarisWorks will read.

MacDraw/ClarisWorks: Exchanging Files w/other Mac Draw Programs

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.

The PICT format should be used to import and export files to and from ClarisWorks, MacDraw II, MacDraw Pro and other Macintosh applications. Use the Save As command in the file menu, choose PICT for the file type, type a unique file name, then click Save. It is also possible to transfer graphics using copy and paste.

To open a PICT file, first open MacDraw II or Pro. Choose the Open command in the File menu, select the PICT file, then click Open.

Macintosh IIfx: DMA Access Support

Is DMA access supported to or from NuBus memory space on the Macintosh IIfx?

Which drives will benefit from DMA on the Macintosh IIfx? Is it only internal drives? Also, is it the same for both the A/UX and Macintosh OS?

This article has been archived and is no longer updated by Apple.
DMA access is supported to and from main memory -- but not to or from NuBus memory space. (The only way to access NuBus memory is through the NuBus controller chip, which is controlled by the 68030 CPU. This makes it impossible to do SCSI DMA involving NuBus memory on the Macintosh IIfx.)

Currently, only A/UX 2.0 supports the SCSI DMA capabilities of the Macintosh IIfx. SCSI DMA is possible on all SCSI devices, not just the internal SCSI device. The internal and external SCSI connectors support the same signals.

When running A/UX 2.0 on a Macintosh IIfx, any SCSI device (internal and external) will benefit from the SCSI DMA capabilities of the Macintosh IIfx.

ClarisWorks: File is not Recognized as SYLK

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
If a SYLK file opens as ASCII Text, it probably lacks a proper header. This happens with files from Accountant, Inc. from SoftSync.

For ClarisWorks to recognize a file as SYLK, the first line of the file must start with:

ID;POriginatingProgram

Just open the SYLK file as a Word Processing file, insert "ID;POriginatingProgram" into the first line, replace OriginatingProgram with the name of the program that created the file, and save as Text.

ClarisWorks: Leading Underline on Blank Lines when using QuickDraw Printers (WP)

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
This issue is corrected in 1.0v3.

Blank lines following a paragraph of underlined text will print with a small dash (underline) in the left margin with any QuickDraw printer using ClarisWorks 1.0v2 or earlier.

Here is a an example of what the text looks like on screen:

Now is the time for all good men to come to the aid of their party.
Now is the time for all good men to come to the aid of their party.

When printed out on either printer it looks like this:
Now is the time for all good men to come to the aid of their party.

Now is the time for all good men to come to the aid of their party.

Workaround
Put a space at the end of the underlined paragraph, select the space and format it as Plain Text (not underlined). The underlining continues to blank lines only when the last character of the previous paragraph is underlined.

ClarisWorks: Printing a Database with a Title Page can Crash

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
This issue is corrected in 1.0v3.

Printing a database in ClarisWorks 1.0v2 or earlier will cause issues if the Title Page option has been checked in the Document dialog box. During printing, part of the current window will be redrawn incorrectly and trying to manipulate this window after printing can result in a crash.
Published Date: Feb 18, 2012

ClarisWorks: Printing A Single Envelope (WP,DR,DB)

Basic tips on how to set up a document to print an envelope.

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.
Note: ClarisWorks 4.0 includes an envelope assistant to automate printing a single envelope. You can access it by selecting the New command in the file menu, then check to view assistant and stationary files.

Earlier versions of ClarisWorks do not have an automatic Envelope printing utility in the sense that you can launch a ClarisWorks document and just print an envelope.

However, with some formatting, you can easily create Database or Drawing documents (Graphics documents in ClarisWorks 1.0) which will print efficiently on envelopes.

The easiest way to do this:

1. Create a Drawing (Graphics) document.
2. Choose Page Setup from the File Menu and choose an Envelope paper format. (If you do not have an Envelope format that you can choose, this technique will not work.)
3. Choose the landscape orientation.
4. Click Ok.
5. When you get back to your document, you will see that the page looks like an envelope. Click on the Text tool at the top of the toolbar, click in the top left corner of the page, and type your return address.
6. Click on the drawing tool (the pointer) at the top left corner of the toolbar, then click on the Text tool again. Click in the center of the page and type the mailing address.

Try a printout and see how the results look. You might want to print on plain paper to check the placement of your text (hold an envelope over the printout to see where the text would appear on the envelope), and make any necessary adjustments in your document before printing onto real envelopes.

Remember that you will need to switch your document back to a normal page setup before printing on plain paper again. Be sure to go back to Page Setup and change your paper size back to US Letter and your paper orientation back to vertical.

ClarisWorks: Publications Correction: Automatic Stationery

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
New versions of the documentation fix this error as of 5/92.

Page 2-25 of the ClarisWorks Handbook incorrectly states that you should name a stationery file "ClarisWorks <document type> Prefs" for it to open automatically when new documents are created. "Prefs" is incorrect. It should be "Options".

The correct names for Automatic Stationery files are:

ClarisWorks WP Options
ClarisWorks GR Options
ClarisWorks DB Options
ClarisWorks SS Options
ClarisWorks CM Options

Note: Saving a Macro file with the name ClarisWorks Macros will force ClarisWorks to automatically load these macros when it's first opened.

ClarisWorks: Rotated Text: Printing and Saving as PICT

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.

Printing

Rotated text will print as a 72 dpi bitmap on QuickDraw printers such as the ImageWriter, StyleWriter and HP DeskWriter. This results in lower quality text. Color information may also be lost.

Saving as PICT

When saving a file as PICT which contains rotated objects, the rotated objects will be saved as a PICT bitmap. This results in jagged printout to all printers, including Postscript LaserWriters. Also, the rotated objects will not be editable in other object-oriented drawing programs since it becomes a bit-map.

Workaround for Printing from ClarisWorks 2.0 or higher

Rotated text retains it's resolution in a Paint document. The ClarisWorks Paint environment is capable of creating documents and frames at several resolutions, including 300 and 360 dpi. The StyleWriter is a 360 dpi printer and the DeskWriter is 300dpi.

ClarisWorks: Sorting on Calculated Cells may Produce Unexpected Results

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
This issue is corrected in 1.0v3.

ClarisWorks 1.0v2 spreadsheet is unable to properly sort calculated cells (cells containing formulas). For example, sorting on 0.5, 1, 1.5, 2, 2.5, 3, 3.5, 4 in ascending order will produce 0.5, 1.5, 1, 2, 3, 4, 2.5, 3.5 when the values are the results of calculations (numbers or dates).

The workaround is to select the range of cells to be sorted and copy them. Click in another area of the worksheet and select Paste Special from the Edit menu, pasting Values Only. The pasted cells will then sort properly since they are data and not calculations.

Macintosh: How To Get Serial Driver GPi Signal Access

As far as I know, the Macintosh serial driver supports checking the status of the HSKi (CTS) input line but does not support the GPi (DCD) input. With the Macintosh IIfx, developers are encouraged not to deal directly with the serial port hardware, since the IOP is in the way. In the past, this was the only way to use the GPi signal. Has the serial driver been extended to support the GPi signal? Support for it is necessary to properly handle high-speed modems.
This article has been archived and is no longer updated by Apple.
The GPi signal is still not supported by the Macintosh serial driver.

To access the GPi line on a Macintosh IIfx, it is necessary to turn off the IOP, as developers have done in the past on other Macintosh systems. This can be done using a control panel, called the "Macintosh IIfx Serial Switch" cdev, available from Software Licensing. Please contact Software Licensing at (408) 974-4667 for licensing information.

ClarisWorks 1.0: Var() Returning Negative Number or StDev() Returning #NUM! Error (SS,DB)

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
This issue is corrected in 1.0v3.

ClarisWorks cannot compute the Standard Deviation or Variance for a certain number of cells (population size). For example, a cell with the formula =Var(A1..A500) may return a negative number while the definition of variance prohibits negative numbers. Since Standard Deviation is defined as the square root of Variance and it's impossible to have a square root of a negative number, ClarisWorks will return #NUM! for a cell with the formula =StDev(A1..A500).

In this example, you can get around the issue by putting =A1^2 into cell B1, then selecting B1 to B500 and choosing Fill Down from the Calculate menu. This creates a range of numbers that are the square of your current data which can be used with the following formulas to derive the Variance or Standard Deviation.

Instead of Var(A1..A500) use:
=(1/(COUNT(A1..A500)-1))*(SUM(B1..B500)-((SUM(A1..A500)^2)/COUNT(A1..A500)))

Instead of StDev(A1..A500) use:
=SQRT((1/(COUNT(A1..A500)-1))*(SUM(B1..B500)-((SUM(A1..A500)^2)/COUNT(A1..A500))))

ClarisWorks: Y-Axis Labels are Clipped or Disappear

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.

There is a fixed distance between the Y-Axis and the left edge of a chart frame which may cause chart labels to be clipped on their left side. Since ClarisWorks displays all chart labels in the same Font, Size, and Style as they appear in your Spreadsheet, change the attributes of those cells so their contents may fit in the allotted space. If this is not desirable then you should find a way to reduce the size of the data itself.

You may choose to customize an ungrouped duplicate of your chart in the graphics environment in order to get wider labels. However, don't duplicate the chart until you've modified your spreadsheet so that all of the labels fit within the frame. Otherwise you'll find that ungrouping the duplicate of your chart will cause those labels that do not fit to disappear. Once ungrouped you can use the graphics tools to create a customized chart but only the original chart will reflect any changes that are made to the spreadsheet in the future.

ClarisWorks: "Port is Not Available" Message

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
When you choose Open Connection in a Communications document, you may see a "Port is not available" alert. This can happen if AppleTalk Remote or another Chooser device is keeping the serial port in use. To fix this, while this alert is visible, hold down the option key. The "Cancel" button will change to "Override". Click the Override button to disconnect the serial port from the other Chooser device and allow ClarisWorks to use it.

Another reason the serial port might be busy is that your modem is hooked up to the printer port and AppleTalk is active. With AppleTalk active, the printer port is an AppleTalk port not a serial port. Either switch your modem connection to the modem port (turn off your Macintosh first) or turn off AppleTalk in the chooser.

ClarisWorks: Freehand Objects, Borders, & the DeskWriter C

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
This issue is corrected in ClarisWorks 1.0v3.

There is a issue with printing freehand objects to the DeskWriter C and ClarisWorks 1.0 v1 and v2. If you unsmooth them, making them polygons, they print fine. If you fill them, however, the fill will print fine but the border will not without the following workaround.

How to print the border of a freehand object on the DeskWriter C:

1. Select a freehand object.
2. Choose Flip Horizontal.
3. Choose Flip Vertical.
4. Cut and paste it to the scrapbook.
5. Cut and paste it back from the scrapbook.
6. Choose Rotate twice.
7. Choose Print...

If an object is copied to the scrapbook and back again, then it is treated as a Grouped Picture. For some reason (probably because it's being treated as a bitmap), freehand objects will print when rotated as a Grouped Picture. The reason you flip the object first is so that it will be in its original orientation after rotation.

DOS Tool Kit: Switching HRCG on and off

The High-Res Character Generator can be turned on and off under software control.
This article has been archived and is no longer updated by Apple.
The following two subroutines will switch back and forth. The software was written assuming the variable "ADRS" is assigned as it is in the subroutine starting at line 2000 of MAXWELL on the Tool Kit diskette.

```
3000 REM TURN OFF HRCG
3010 PRINT CHR$(4);"PR#0"
3020 PRINT CHR$(4);"IN#0"
3030 HOME
3040 TEXT
3050 RETURN
4000 REM TURN ON HRCG
4010 CALL ADRS + 3
4020 RETURN
```

Beware: HRCG overwrites the text screen when outputting to the High-Res screen. It will destroy any information there. You will have to rewrite the text screen after using HRCG.

AppleTalk: Zones and Multicast Addressing Questions & Answers

Here are some questions and answers about AppleTalk zones and multicast addressing.

This article has been archived and is no longer updated by Apple.

Q) How do machines that reside in the same zone know how to communicate with other machines?

A) Macintosh-to-Macintosh communication, such as transferring a file from a workstation to a file server, does not have anything to do with zones. The workstation knows the network number and node address of the file server and can send packets directly or through a router to the file server and vice versa.

Q) I've heard about a name table that is used with zone multicasting. Where does that table reside, and who maintains it? Does the router or the workstation maintain it?

A) Extended AppleTalk Phase 2 networks (EtherTalk 2.0 and TokenTalk 2.0) can have several zones defined for a single physical cable. When a user selects the zone that he wants his machine associated with, a multicast address for that zone is added to the hash table of multicast addresses that the Macintosh accepts. The hash table is maintained on the network adapter NuBus card.

Q) Who assigns the zone multicast address, and where is it done?

A) The multicast address for a particular zone is extrapolated from the zone name itself and is done by an AppleTalk Phase 2-compatible router on the extended AppleTalk Phase 2 network. A checksum algorithm is used by ZIP (Zone Information Protocol) to convert the zone name into a multicast address and is returned to nodes, with the multicast address for the zone that the node has selected, on the Internet through a GetNetInfo reply packet by the router.

Q) If I have two machines on Ethernet that are in the same logical zone and one is near the router and one is 300 meters away from the router, how do these nodes interact and not cause excessive traffic on the network? What happens if the two machines are on different networks (for example, Token Ring and Ethernet)?

A) See the first answer above. No extra packet traffic is generated.

Additional Information

A zone on an extended AppleTalk Phase 2 Internet is an arbitrary subset of the AppleTalk nodes on the Internet. A particular network can contain nodes belonging to any number Of zones. The zone list and network number range for a particular extended AppleTalk Phase 2 network (physical cable) is maintained by routers. Nodes choose their zone from a list of zones available for their network.

The only time zone multicasting comes into play is when an NBP call is made.

For example, your Macintosh is on network 1, an EtherTalk 2.0 network, and has selected zone "Campbell 2" as the zone to which it belongs. There are five other Macintosh systems on network 1; one is an AppleShare File Server and has selected the zone "Campbell 2" to belong to. The other four have all chosen "Soup 1" as their zone. Now, you open the Chooser and select the AppleShare icon. Your Macintosh sends out an NBP lookup for all AppleShare File Servers in the "Campbell 2" zone. This NBP lookup is encapsulated in an Ethernet packet with a multicast address that matches only two nodes on network 1: your node and the AppleShare File Server.

Only the AppleShare File Server node will process the packet. The others will ignore the packet because the multicast address does not match any address in their multicast address hash table. On an EtherTalk 1.0 network, every node on the network or same physical cable would have processed the packet.

ClarisWorks: Unknown File Version Message

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
When importing files of another format (e.g. Microsoft Works) users may get the message "Unable to import file. Unknown file version".

This message is an indication that ClarisWorks is recognizing the creator type of the file. It is identifying it as a AppleWorks or Microsoft Works file, for example, but is unable to read the version of the file. This will occur, for example, if the user attempts to open a MS Works 1.0 database file.

Two possible solutions
* Open and save the file in the version supported by ClarisWorks. (e.g. open the MicroSoft Works file in MSWorks 2.0)
* Export or save the file in a format supported by ClarisWorks. (e.g. Text, Export formats)

Claris: General Instructions for the Set Up and Use of MacPlot

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
Below are general instructions for using MacPlot. There are important details listed at the bottom of this record and on other records.

In general: Using MacPlot is like using any other printer driver; you must select it in the chooser, make sure that the cable is plugged in to the correct port (modem or printer) shown in the chooser and you should go to Page Setup and hit OK.

The most common issue by far is using the wrong cable! We do not support custom made cables or cables that are not listed on the record entitled, 'Cables Recommended for use with MacPlot.' Even if you can plot from other programs, that doesn't mean that the cable you are using will work correctly with MacPlot.

Once the MacPlot driver is selected, you use the MacPlot Configure program to configure the driver for the particular plotter you are using. To configure the driver:

1) Double click on the MacPlot Configure program. Under system 6.x, if the MacPlot driver is not selected in the Chooser, MacPlot Configure brings up the Chooser for you. In System 7, You must choose the MacPlot driver in the Chooser before launching MacPlot Configure.

2) Go under the Windows menu to Settings. This brings up the window where you select the particular plotter that you are going to plot to. Generally you will not have to change any of the other settings.

3) Go under the Window menu to Pen Info. If the plotter can handle more than one pen, you must add a pen for each color that you want to plot, and you must enter the position number for each color of pen that you wish to use. This is a common error! You must enter a position number.

4) Quit MacPlot Configure, go to your program and use the Print command to get the plot started. You may be prompted to make sure that the carousel and paper are in place.

If you are using System 7.0 or later, the MacPlot driver must be in the System folder and not in the extensions folder. If you drag the driver onto the System folder icon, System 7 will want to put it in the extensions folder. To avoid this, double click on the System folder to open its window and drag the MacPlot driver into the System folder window. The MacPlot Configure program may be anywhere on the drive.

There is a serious issue if you use a MacPlot driver previous to version 1.2 and PrintMonitor. It may corrupt the system. If you have a customer who has used an early version and PrintMonitor and has also printed to a LaserWriter you should assume that there is corruption in their system and it should be replaced!

Slowing down the pen speed may increase the quality of the final output. If you plot in draft mode, you will get a rough equivalent of the final mode plot. Hidden lines may plot, and objects that show on the screen may not plot accurately.

Claris Resolve: Issues with Non-U.S. Scripts

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
There are a few issues concerning the compatibility of the U.S. version with the German version of Claris Resolve. All Claris Resolve functions have been translated in the German version. For this reason, scripts written in U.S. version are not going to work in certain instances with the German version. This and what follow is also the case with the French version.

EXPLANATION:

Scripts written in the U.S. version of Claris Resolve containing functions (e.g. Sum(), Left(), Contains(), Round()) will not work with the German version which expects: SUMME(), LINKS(), ENTH□LT() and RUNDEN(). This ONLY applies to scripts that have been uncompiled, or scripts that have been saved as text. This is not an unreasonable limitation, as scripts are only text files, and to give Claris Resolve the ability to compile a (text) script that has been written in any language would be a major demand.

SOLUTION:

When you compile a script with no text,

COMPILE SCRIPT scriptname TO newscriptname NO TEXT

the function names within the script get stripped out and replaced with token numbers. The token numbers for the various functions are the same no matter what language they have been written in. This means that a US script will correctly run in the German version - with one limitation.

If a function is embedded in literal text, then it will not be tokenised when compiled. For example, if you have the following 1-line script in the US version

PUT Sum(1,2,3) INTO A1

and you compile it with no text, everything will be fine when you run it in the German version.

However =, if you compile the following in US version with no text,

PUT "=Sum(1,2,3)" INTO A1

you will get an error when you run it in the German version. The function Sum() will not be tokenised in this case because it is contained in a string.

Claris Resolve: Copy as Picture

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
When you copy a range of cells in Claris Resolve, three layers of information are put on the clipboard:

"rslv" for Claris Resolve specific data
"pict" for picture-oriented data (fills and pen width, etc.)
"text" for plain-text use.

If you switch to a word processor and paste, most word processors will choose to use the "text" layer of the Claris Resolve clipboard. This lets you easily format the columns, fonts, etc. But sometimes you want the chart to show up just as it did in Claris Resolve.

The answer is to paste the items into a drawing program like MacDraw Pro. MacDraw Pro prefers to use the pict portion of the image, and discards the other two layers. After you paste, you can copy this item from the drawing program and and paste it back into your word processor.

The Copy As Picture utility added to Claris Resolve 1.1 has corrected this issue.

However, an Easy Install does not install the utility. To access it, do a Custom Install of the "Resolve Utilities Menu". Once this Custom Install has been completed, a Utilities menu will appear in Claris Resolve with "Copy as Picture" and a plethora of other options.

Claris CAD: Inaccuracies and Drawing Issues with Arcs

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.

In Claris CAD 2.0v3 and earlier, some arcs can contain errors, or inaccuracies. The issue can occur whenever the arc has a fractional starting angle, ending angle, or included angle. (If the start and end angles are integers, the included angle will also be an integer.) Midrange arcs usually are correct; the issue is mostly associated with exceptionally large, or exceptionally small arcs.

Apparently, QuickDraw can handle the arcs with integral included angles, and cannot deal with the fractional ones. When a fractional one must be used, we employ different routines, which can behave differently than the QuickDraw routines. (We in fact attach a small line to the end of the arc to attain the fractional adjustment.)

To eliminate the issue, set the starting angle, ending angle, and included angle to integral values. To do this you would:

1. Select the arc then select '"Show Info"' from the Layout.
2. Round the start angle in Show Info to the nearest whole number.
3. Round the end angle to the nearest whole number.

Note: The issue is also solved by exporting the file as EPSF format.

Claris CAD: Arrows Dialog Locks up my Machine

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
Q. When I bring up the "Arrows..." or "Line Styles..."dialog box my machine locks up. Sometimes the dialog doesn't appear fully on the screen. Sometimes I even see an error dialog. What is happening?

A. This should only happen when you have translated a file from Claris Graphics Translator. This happens because the arrow head size is scaled smaller then what Claris CAD can handle. The smallest arrowhead is .03 of an inch. A couple of work arounds are listed below.

1. Try to scale the drawing before coming into Claris Graphics Translator so the arrow heads are not scaled as dramatically. Note: Be sure to turn off the "Calculate object bounds" preference. You can find preferences under the "Layout" menu in Claris Graphics Translator.

2. Remove all arrow heads before translation by Claris Graphics Translator.

3. Copy and paste the information to a new Claris CAD file. This can be cumbersome if the document has several layers.

4. Save the document as a MacDraw II 1.1 file. Then re-open the file and save it back into Claris CAD format. This is less cumbersome than option 1, but can cause issues for users with arcs. The arcs may come back into Claris CAD slightly smaller than they were before. Please have users check for this issue if they choose to use this option.

Claris CAD, MacDraw: Pen Weights do not Print Correctly

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
Issue: When printing to a Postscript LaserWriter, lines and polygons do not print with the correct pen weights. Some lines print thicker than others. What is the issue?

Solution:
Claris CAD: If you have Claris CAD 2.0v3 and the EPSF translator that comes with MacDraw Pro, save the document as an EPSF file, open this file in another program, then print.

Explanation:
Lines: Claris CAD (any version), MacDraw II and MacDraw Pro print lines as QuickDraw objects. Thus, horizontal and vertical lines print at the correct pen width. Other lines, however, print slightly thicker than the line's defined pen weight.

Polygons: Claris CAD (any version) and MacDraw II 1.0 print polygons as QuickDraw objects. Thus, horizontal and vertical sides within a polygon print at the correct pen width. Other sides, however, print slightly thicker than the polygon's defined pen width. MacDraw II 1.1, although it prints polygons as QuickDraw objects, prints polygons with the correct pen width. However, the maximum number of printable vertices in a polygon is reduced. MacDraw Pro prints polygons as Postscript objects to a Postscript printer. Thus, all sides of a polygon print at a contstant width.
Printing an EPSF version of such objects bypasses these limitations.

Claris Resolve: Documentation Error

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
Documentation / Publications Error

At the bottom of page 6-3 in the Claris Resolve User's Guide, the following paragraph gives an example of what you might want to use this feature for:

"You can also publish and subscribe between Claris applications. For example, you could publish a table of data from MacWrite II to Claris Resolve, create a chart of the data in Claris Resolve, and then publish the chart back to MacWrite II."

Well, this is incorrect. MacWrite II does not support Publish and Subscribe. MacWrite Pro, however, will support this feature. The paragraph should read:

"You can also publish and subscribe between Claris applications. For example, you could publish a table of data from MacWritePro to Claris Resolve, create a chart of the data in Claris Resolve, and then publish the chart back to MacWrite Pro."

Claris Resolve: Enter Key Does Not Change Cells on Discontiguous Selections

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
If you have two discontiguous selections and one or both of them contains a single cell, hitting the enter key will not change the current cell from the singe selected cell(s).

To reproduce:

1) Select cell A1. Hold down the command key and select cell A3.
2) Hitting the enter key should switch between the two selections, but it will not.

If either of the selections contains more than one cell, the enter key will move through that selection to the last cell, then to the single cell. It will then not move out of the single cell.

Claris Resolve: ALERT Command

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
Claris Resolve has an undocumented command call ALERT which brings up an alert dialog box. The syntax for this command is as follows:

ALERT number "text"

Where number = type of alert

Number	Type	Icon	Beep?
0	Warning	Hand/Stop	Yes
1	Comment	Talking Head	No
2	Error	! / Triangle	Yes

The number argument will accept virtually any number, however, numbers other than 0, 1 or 2 will bring up the standard MESSAGE dialog box with no icon or beep.

Additional index search words: missing

Claris Resolve: KILL RANGE Command

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
The KILL RANGE command used many of the Claris Resolve dialog and menu scripts is not explained in the documentation. This command is defined as follows:

KILL RANGE rangevalue

Recovers memory used while pre-defining a range used by a command or function.

If you don't use the KILL RANGE command, you won't have as much available memory for use with other commands.

Rangevalue must be an integer between 1 and 13, inclusive, representing a range pre-defined by one of the following commands:

1 REPORT HEADER RANGE [USING range]
2 REPORT FOOTER RANGE [USING range]
3 REPORT PRINT RANGE [USING range]
4 SORT RANGE [USING range]
5 TABLE RANGE [USING range]
6 INPUT CELL 1 [RANGE range]
7 INPUT CELL 2 [RANGE range]
8 VALUES RANGE [USING range]
9 BIN RANGE [USING range]
10 DATA RANGE [USING range]
11 CRITERIA RANGE [USING range]
12 CHART RANGE [USING range]
13 SERIES LABEL RANGE [USING range]
14 DIVISION LABEL RANGE [USING range]
15 TITLE RANGE [USING range]
16 FOOTNOTE RANGE [USING range]
17 AXIS TITLE RANGE [USING range of Axis 1]
18 AXIS TITLE RANGE [USING range of Axis 2]
19 AXIS TITLE RANGE [USING range of Axis 3]
20 AXIS TITLE RANGE [USING range of Auxiliary Axis]
21 SERIES DATA RANGE [USING range 1]
22 SERIES DATA RANGE [USING range 2]
23 SERIES DATA RANGE [USING range 3]

NOTE: This command is missing from the documentation provided with Claris Resolve 1.0. The rangevalue arguments, however, are the same as those used by the GetRange function listed in the online Scripting Reference Guide.

Claris Resolve: Rotate text in your worksheets

The ResolveScript commands "add text" and "rotate on" let you place rotated titles into your worksheet.

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
Q .Is there a way I can rotate text in Claris Resolve? I want to place a horizontal heading along one of my columns of figures.

A. Although you won't find a rotate command in the menus, you can easily apply a short ResolveScript command to get the rotated heading you need.

Suppose you've got your series of figures in the range D2..D18. You want the heading "Before Discounts" to appear to the left of these values, in range C2..C18. Just type the following line into the Entry bar, and--this step is especially important--press Command-return at the end.

add text "Before Discounts" range C2..C18 text rotate on

You'll see the text "Before Discounts" appear, rotated 90 degrees. You can change the font, size, shape, color, location, etc., of this text to suit your needs. But you can't edit the text inside the object after it's placed.

Here's how it worked: When you pressed command-return, instead of the usual plain return, Resolve treated your entry as a script command, not a cell entry. (Any script command can be issued in this "interactive" fashion, similar to the way the HyperCard message box works.) The "add text" command creates a special kind of object called a "control." Controls are normally used only when you're writing a script, to create custom dialog boxes. Text you add with the usual method, the text tool, can be edited at any time, but not rotated. Text in controls can be rotated, but not edited.

Claris Resolve: ATIME Documentation Error

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.

Documentation / Publications Error

There is an error in the online Scripting Reference stack related to the ATIME function. The picture command for seconds is listed as" ss" when it should really be "sc".

This is inconsistent with the NCustFormat function which uses "ss" for seconds. This inconsistency will be remedied in a future version of the product when "sc" will be replaced by "ss". Currently, the manual correctly lists seconds as "sc" so it will be in error when this parameter is changed.

The NCustFormat function does not support hundredths of a second so the "hn" picture command does not work (it returns a composite of the hour and minute).

NOTE: The NOW() function does not return hundredths of a second so the "hn" picture command will always return zeros when used in the ATIME function where NOW() is the serial number argument.

MacWrite, MacPaint or MacDraw: Obtaining Early Versions

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
Currently (February, 1992), Claris cannot provide replacement disks for the following early versions of MacWrite, MacPaint, or MacDraw:

MacWrite: Any version prior to 5.0.1
MacPaint: Any version prior to 2.0
MacDraw: Any version prior to 1.9.8

People who have older Macintosh computers and/or prefer not to upgrade their software can contact a local users group for replacement disks for some of these versions. To find a local user group, call Apple's User Group Connection at 800-538-9696.

Another source for older software versions is B&R Computer Services. They also buy, sell, support, and repair older Apple and Macintosh computers and software.

Claris Resolve: Global Variables and the Now() Function

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.

In order to access a variable defined in the Worksheet script from a button script, you must specify the name of the worksheet along with the variable name as follows:

'Worksheet Name:Variable Name'

This can cause serious issues if the name of the worksheet is changed. Below is a sample script which sets a Worksheet script variable without having to hard code the name of the worksheet:

```
ON MOUSEUP
SELECT RANGE A1
RUN "" & Name() & ":theVariable' = True()"
END MOUSEUP
```

There is one issue with this method. The Name() function returns the name of the currently selected object or the worksheet if no object is selected. If the current selection is not a cell when this script is run, therefore, it will not produce the desired result. This is why the first line of the above example selects the range A1. We could select any range here or, to be more sophisticated, check the type of the current selection (using the Selection() and IsRef() functions) and only select a cell if the current selection is not a range reference. The point is that we need to make sure that a range is selected so the Name() function returns the worksheet name and not some random object name.

ClarisWorks: 50 Rows or 10 Columns Limits?

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
When you create a spreadsheet frame in a word processor document, you get 50 rows and 10 columns as a default size. If you try to resize the frame larger than that or if you try to paste more data than that, it will not work.

To enlarge the size of the frame, select the frame and go under the View menu to Open Frame. Then go under the Format menu to Document and increase the number of rows and columns to fit your needs.

This situation will sometimes occur when trying to resize across a page boundary. The issue is not the boundary; it is the default size of the frame.

There is an alternate method which allows the user to add 5 rows at a time to a spreadsheet frame of a word processing document without opening the frame.

Create the frame and expand it to 50 rows. Go under the Options menu to Frame Links. An arrow will appear at the bottom of the spreadsheet frame. Click the arrow and create a new spreadsheet frame with as many new rows (up to 5 additional) as you want. The first row will be row 51. Now go back and resize the first frame and then you can delete the second frame.

ClarisWorks: Cell Formatting Removed

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
In a Spreadsheet, when you delete data from a cell using either the delete key or command-X, all the formatting for that cell is lost (bold, borders, etc).

If you update data (replace data within a cell with different data), then type either return, enter, or go to another cell via the direction arrows on your keyboard, the cell retains its' formatting. Only deleting all the data in a cell results in lost formatting.

Note: This is not the case in ClarisWorks 2.x. In ClarisWorks 2.x, when you delete data from a cell using either the delete key or command-X, only the value within the cell is deleted. You have to use the Clear key (from your keyboard), or the Clear command from the Edit menu, in order to delete both the formatting as well as the cell's value.

ClarisWorks: Date Formats

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
This is to clarify the issue with date formatting in ClarisWorks running under non-US system software.

Issue: Dates in ClarisWorks which are formatted, don't retain the chosen format.

Solution: ClarisWorks looks to the System resources for its date formats. In the French Canadian System, dates are only recognized if they contain the leading zero in the day AND month portion of the date string. Example (using dd/mm/yy format):

"7/2/92" is not accepted by the system as a date string. The correct entry is "07/02/92".

NOTE: Users of French System software must NOT include the leading zero with the day entry but must include it with the month entry only. Example (using dd/mm/yy format):

"7/2/92" and "07/02/92" are incorrect. The correct entry in this case is "7/02/92".

In general, the date string entered by a user must match the date format in the itl0 resource in the system exactly.

ClarisWorks: Fields Do Not Fit on Standard Layout Message

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.

When you choose "Insert Field..." from the Layout menu, ClarisWorks puts the field at the bottom of the body, below any other object, in the current layout. If the body line is down near the extent of the maximum layout size and there is any object (field or text or graphic) near the body line, then there will not be enough room to insert the field and you will get the message 'Some fields do not fit on the standard layout. Move existing fields to create space and then insert remaining fields in layout mode.'

The solution is to free up space at the bottom of the layout and then insert the fields.

ClarisWorks: Frame Will Not Expand Across Page Break

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
If you are trying to resize a ClarisWorks Spreadsheet Frame in a Word Processing document or a ClarisImpact Model in a Report document and you try to go across a page boundary, it will only work if you have already created the next page.

In other words, let's say that you have a one page Word Processing document or a Report document and you want to resize your Frame or Model to the second page. You have to create the second page first, or you just won't get the frame across the boundary.

To create the second page you must create type that extends past the first page. Hitting return a bunch of times works. If you delete what you have typed on the second page, the page will disappear.

ClarisWorks: How to Find Records in ClarisWorks

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
There are three methods for selecting records in ClarisWorks:

1. Find/Change command (Edit menu; Cmd-F/Ctrl-F). This searches all fields for the next occurrence of the word you specify.

2. Find command (Layout menu; Shift-Cmd-F/Shift-Ctrl-F) which functions somewhat like the Find command in FileMaker, with these differences:
-a- These operations are not available in the ClarisWorks Find mode:
Ranges(...) within a field
Blanks(=)
Duplicates(!)
-b- Finding on text finds embedded characters as well as words that start with those text characters. For example, finding "sm" in the Last Name field finds all records that contain "sm" anywhere in any word in the Last Name field (Smith, Blacksmith, etc.)
-c- Math operators do not work in text fields. For example, entering ">=S" will not find any records. To search text using math operators, see the info on Match Records.

3. Match records (Organize menu; Command-M). This lets you enter a search formula, like:

AND(('FirstName'="Bob"),('State'="MI"))

After using Match Records, the found records are selected, but all records, selected and unselected, are still browsed. Usually, you'll want to use the Hide Unselected or Hide Selected command immediately after using Match Records.

TIP: If you are using ClarisWorks 1.0, while the Match Records dialog is open, select the formula, then Copy (Cmd-C/Ctrl-C). You can then reselect Match Records and Paste the formula back into this dialog box, so you won't have to enter the formula from scratch. ClarisWorks 2.0 retains the last formula when you enter "Match Records" again.

TIP: Finding a range of Records
You can find ranges using the Match Records method with the AND function.
For example, this formula:
AND('LastName' >= "D", 'LastName' <= "F")
finds the records where the first character in the last name field is D, E or F.

TIP: Finding blank records
The ISBLANK function detects records where a field is blank. In Match Records, the formula:
ISBLANK ('LastName')
will select all records where the LastName field is blank.

TIP: Finding duplicate records
To identify duplicate records, you could create a sub-summary report by the field you want to find duplicates on and include a summary field which counts. Anything with a count of 2 or more would be a duplicate, which you could manually delete.

ClarisWorks: Separating City, State and ZIP into Separate Fields

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.

In many databases it is common to enter city, state and zip information into one category (field). However, if you separate this information into separate fields, you'll have more flexibility in formatting this information on a layout, and in finding and sorting records. When you convert a database file from your old database program to ClarisWorks, the city, state and zip information may still be in a single field. Here is a suggested way to separate this information into three fields:

Note 1: This example assumes that you have entered the city, state and zip information with a coma after the city, and the two letter designation for the state. This example also assumes that the field containing the city, state and zip information is named "CSZ".

City (calculation,text) = IF(FIND(",",'CSZ',1),LEFT('CSZ',FIND(",",'CSZ',1)-1),LEFT('CSZ',FIND(" ",'CSZ',1)-1))

State (calculation,text) = MID('CSZ', FIND(",", 'CSZ',1) +2 , 2)

Zip 9 (calculation,text) = IF (FIND ("-",'CSZ',1),RIGHT 'CSZ',10),RIGHT ('CSZ',5))

Note 2: Make sure your "format results as" selection is set to Text. If not, click and drag to change it. Check the three fields in Browse mode to verify that they correctly separated the information. If so, return to Define Fields and change each field from a Calculation field to a Text field. Finally delete the original Text field.

MacDraw Pro: Adobe TypeAlign Issues

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.

Issue #1:
The following issue has been observed using Adobe TypeAlign 1.0.4 with MacDraw Pro 1.0v1: When text objects from TypeAlign are placed into MacDraw Pro (either through the clipboard or by an imported PICT), other text objects created in MacDraw Pro may print in the wrong font or size.

Solution: Select all the TypeAlign objects (which must be ungrouped). Choose Move to Front.

Explanation: TypeAlign objects seem to effect other text objects that are higher in the stacking order, making them take on font and style attributes of the TypeAlign objects. Thus, by moving the Type Align objects to the top of the stacking order with Move to Front, all MacDraw-originated text objects will be lower in the stacking order and unaffected.
At this point, the issue appears to be a TypeAlign issue.

Issue #2:
TypeAlign objects copied and pasted into MacDraw Pro appear correctly on screen, but print incorrectly, looking like a barcode.

Solution: Save As an EPSF file from TypeAlign, then Place into MacDraw Pro, instead of using the clipboard. The EPSF will print correctly.

ClarisWorks: AutoDoubler Issues

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
AutoDoubler version 1.0 has been reported to sometimes unbundle FileMaker Pro files. This results in files losing their icon and giving the "Application busy or missing" message when double-clicked.

The bundle bit is stored in the header of each file, and acts as a pointer to the file's creator, where icon resources are stored, among other things. AutoDoubler compresses and decompresses files in the background, and is known to unbundle PageMaker files. A utility for re-bundling PageMaker files ships with the product, but does not work for FileMaker Pro files. AutoDoubler is a cousin of DiskDoubler.

The developer, Salient Software, has been notified of this report and will investigate the issue.

AutoDoubler, versions prior to 1.0.5, will conflict with opening files created by ClarisWorks or FileMaker Pro.

Macintosh Portable: How the Sleep State Works

Is there any way to make the Macintosh Portable wake up from sleep just by presenting information on the serial ports? Also, can you put the screen and the disk to sleep and still have full access to the logic card?

This article has been archived and is no longer updated by Apple.
The Macintosh Portable will wake up for various reasons but not by sensing information on the serial ports.

In sleep mode, the Macintosh Portable has all system power turned down except for the keyboard processor and the modem card ring-detector circuitry, if one is installed.

Three possible conditions will end the sleep state:

- If a key is pressed on the keyboard.

- If the wake-up timer is enabled and matches the real-time clock.

- If the Macintosh Portable internal modem is installed and set up to watch for "ring detection".

You cannot selectively put some Macintosh Portable components to sleep, except for the hard disk drive via the Portable CDEV.

MacDraw II or MacDraw Pro: Translated DXF File Error Message

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.

A DXF file translated to MacDraw II using CGT may result in an error message when opened into MacDraw II or MacDraw Pro.
MacDraw II error message:
"This document contains some objects not recognized by this verison of MacDraw II...".
The file will open if the OK button is clicked.

MacDraw Pro error message:
"Sorry, there are issues communicating with the translator 'MacDraw II 1.1'."
The file will not translate into MacDraw II at all.

These error messages occur because there are points (point objects) in the DXF file that CGT is translating into the MacDraw II file. There are two workarounds to this issue.
Solution #1:
Use CGT to translate the DXF file to a Claris CAD file. Open the Claris CAD file in Claris CAD 2.0. Save the file as a MacDraw II file. This file will read correctly into MacDraw Pro.
Solution #2:
Turn off the points in Autocad, then do a DXF out. This may cause the points not to be exported to DXF. CGT can convert this DXF to a MacDraw II file that can be translated by MacDraw Pro.

ClarisWorks: How To Display Leading Zeros In A Cell

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.

In some cases you may want to display a number with leading zeros (i.e. 007). ClarisWorks Spreadsheet and ClarisImpact Table Model will normally identify 007 as a number and trim the leading zeros. To override this, type an equal sign and enclose the number in double quotes.

Example: ="007"

In the above example, 007 will be displayed WITH the leading zeros and will default to left justification as all text fields do.

ClarisWorks: Single Column Print Ranges in Spreadsheets

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
Printing with a single column print range will result in a corresponding second page being produced. This spurious page will display a series of row headers, or a vertical line if row headers have been deselected with the display command.

The workaround is to select two columns for the print range, then collapse the second column so it is hidden from view.

This issue occurs in every version of ClarisWorks 1.0 and is still under investigation. It may be related to the print driver selected.

Claris Resolve: Publish & Subscribe with Microsoft Word 5.0

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
When publishing a Claris Resolve 1.0v2 spreadsheet and subscribing to it in Microsoft Word 5.0, the data comes into Word as tab separated data with a return after each row. One can then use the Text to Table menu item under the Format menu to change it to a table.

When publishing/subscribing over a network, the volume that the publisher resides on must be mounted on the desktop before subscribing for the first time. When reopening the subscriber, the volume that the publisher resides on will automatically be mounted.

REMINDER: a published edition will only be updated when the publishing document is saved. Therefore, after making changes to data in Claris Resolve, select save and watch the information update in Word .

ClarisWorks: Setting up Mailing Labels

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
This article describes in detail the steps needed to create custom mailing labels for all versions of ClarisWorks software. The ClarisWorks User's Guide/ Handbook and Help also contain instructions for creating label layouts. In addition, newer versions of ClarisWorks software include Assistants that greatly simplify the label-making process.

Before you can create mailing labels, your information must be entered into a database. If you don't yet have a database with your names and addresses in it and you are using ClarisWorks 5.0 or ClarisWorks 4.0, you can use an assistant to create your database:

ClarisWorks 5.0:
Select New from the File menu. Click the "Use Assistant or Stationery" radio button, then select "All Assistants" for the Category. Choose Address List, then click OK and follow the instructions in the assistant. Once done, delete the example people in the Address List and add your own contacts.

ClarisWorks 4.0:
Select New from the File menu. Click the Use Assistants checkbox, then select the All Assistants category. Select "Name and Address List" and open it. Follow the instructions; when done, delete the examples and add your own contacts.

If you are using ClarisWorks 5.0 or ClarisWorks 4.0, you can use an assistant to create your labels and skip the rest of the steps in this article:

ClarisWorks 5.0:
In your Address List database, go to the Help menu and choose ClarisWorks Assistants. Click on Create Labels Assistant, click OK, and follow the instructions.

ClarisWorks 4.0:
Open your database. While in Browse mode, select ClarisWorks Assistants from the Help (?) menu and choose Create Labels. Follow the instructions as they appear.

If you are using ClarisWorks 3.0 or earlier or would like to create a label layout without using an assistant:
Step #1: Setting Document Margins
Select the Document command from the Format menu. Set the document margins to match the labels:
Label Sheets: Set the top margin to match the distance from the top of the label sheet to the top of the first label. For 1-inch labels, this is usually 0.5 inches. Likewise, set the left, right, and bottom margins to match the label sheet. If the labels extend all the way to the edge of the sheet, set the margins to the smallest allowed by your printer, usually between .25 and .5 inches. Click OK to exit the Document Dialog. If printing to a LaserWriter or other Postscript printer, select Page Setup; click Options, then set the "Larger Print Area" so it's checked. Click OK twice to exit Page Setup.
Note: This Larger Print Area is needed for many, but not all labels. However, it's OK to turn this option on whether it's needed or not.

These example settings for the following Avery labels should work with most LaserWriters:

Label No. Top/Bottom Margin
5160 0.5/0.5
5196 1.75/0.25
5197 1.0/1.0

Tractor Feed Labels: Set the top and bottom margin to zero. Set the left and right margins to the minimum supported by your printer (usually 1/4"). Click OK to exit the Document Dialog. Then select Page Setup. Set the "No Gaps Between Pages" option so that it's checked.
- To print labels that are 1" high, choose US Letter for the Paper Size.
- To print labels that are 2", 3", or 4" high, choose International Fanfold Paper Size (it's a 12" paper height, so it's an even multiple of 2", 3" and 4").
- To print labels that are 3.5" high, choose US Legal Paper Size.

Step #2: Creating a Label Layout
Choose New Layout... from the Layout menu
ClarisWorks 1.0 / ClarisWorks for Performa: Click on "Label" for the layout type. Click OK. Go to Step #3 below.
Other versions: Click on "Label" for the layout type. Click the "Custom" pop up menu, then select your label model number (e.g., Avery 5160). Click OK and skip to Step #4 below. Or, to set your own label size, choose Custom, click OK, and go to Step #3.

Step #3: Setting Label Size
In the Label Layout dialog, set the correct dimensions according to the following guidelines. Click OK.

- -Label size means the distance from edge to edge of two adjacent labels. For instance, a label's height is 1.0 inches if the distance between its top

edge and the top edge of the next label is 1.0 inches, even if the label's specifications say that they're 15/16" labels.

These settings for the following Avery labels should work with most LaserWriters:

Label No.	Label Width	Label Height
5160	2.75	1.0
5196	2.75	3.0
5197	4.19	1.5

Note: you cannot get back into this screen after the layout is created. If you set this information incorrectly, make a new layout starting with step #1 above.

Step #4: Choosing the Fields
Double-click on each field you want on the label. When done, click OK. You will now be looking at the label layout. All the fields will be in a single column and will be the full width of the label.

Step #5: Positioning the fields
You'll need to adjust the width and position of the fields. For example, to get FirstName and LastName fields on the same line, first make the field boxes shorter. To do this:
- You must be in the Layout mode (select Layout from the Layout menu).
- Click once on a field box to select it.
- Click the selection handle at the bottom right corner and continue to hold down the mouse button, then drag left to resize it so it's shorter. Release the mouse button when the field is the desired size.
-When the fields are resized, click inside the field box (not on the handles) and drag it into position.
- You'll need to place all the fields ABOVE the Body line and to the left of the vertical column line so that they'll print correctly.

Step #6: Positioning fields for sliding objects
The sliding objects feature is automatically turned on when you create a label layout. Sliding objects will, for example, close up extra space between the FirstName and LastName fields when you print. In order for sliding objects to work correctly:
- To slide up or left, fields cannot touch or overlap. You can verify this by increasing the window zoom level to 200% (lower left corner of the screen) , then moving fields apart if necessary.

- To slide left, all the fields in a row need to have their tops perfectly aligned. The easiest way to do this is to select all the fields in a row (hold the shift key, then click on each field), then choose Align Objects from the Arrange menu. Choose Align top edges; Left-to-Right: none.

- To slide left, objects must be of equal height or shorter than the object to their left. In other words, now that you've got the tops of the fields in a row aligned, the fields need to be sized so that the bottoms of the fields are aligned. If you have a row of fields such as "City", "State", "ZIP", then "State" can't be taller than "City" and "ZIP" can't be taller than "State". You can verify the size of the fields by increasing the window zoom level to 200%. Sliding up is not affected by field width.

Note: Objects slide only for printing, not on screen. To see if sliding is working, either print the document, or use the Preview option if your printer driver offers it (DeskWriter does, for example).

If a label layout does not print correctly on your labels, it's usually easier to start over and make a new layout than it is to fix an existing layout.

ClarisWorks: Age Calculation Based on Birth Date Field or Cell

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
Use the following formula to calculate an age given a birth date. This formula will work in a ClarisWorks Database document given a field named Birthdate, or in a ClarisWorks Spreadsheet document or ClarisImpact Table Model using a cell reference rather than a field name.

Age (Calculation, Number result)
=YEAR (NOW()) - YEAR ('Birthdate') - (IF (NOW ()<DATE (YEAR (NOW ()), MONTH ('Birthdate'), DAY ('Birthdate')),1,0))

This formula subtracts the year of birth from the current year and subtracts an additional year when the month and day of birth fall between Jan 1 and the current month and day (since the person hasn't had their birthday yet).

To calculate the age in years and months:

Some teachers need to be able to calculate a student's age for placement reasons. This series of calculations will allow you to enter a birth date and calculate the age in years and months.

Birthdate (Date)
Interim (Calculation, Number result) = NOW()-'birth date'
Month (Calculation, Number result) = ROUND(MOD('interim',365.25)/30,0)
Year (Calculation, Number result) = INT('interim'/365.25)
Output (Calculation, Text result) = CONCAT('Year'," Years ",'Month'," Months")

One caveat: This calculation will fix the age to the date that the birth date was entered. To update, go to define fields, double click the field description and press OK and Done to recalculate.

Claris Resolve: Checking for Open Worksheets

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
When writing a Claris Resolve script, it is sometimes necessary to determine if a particular worksheet is open. The NAME function will return the name of the current worksheet (if the current selection is a cell). When several worksheets are open, however, there is no built-in command to determine the names of all the open documents.

One technique you can use to determine whether a worksheet is currently open requires that a dummy function be placed into the Worksheet Script of each file you what to check for:

```
FUNCTION isOpen()
RETURN 1 {this line is not really necessary}
END FUNCTION
```

You can then call this function from a script and check for the existence of an error. If an error is returned, the worksheet is not open.

```
IF ISERR(Worksheet1:isOpen()) {replace Worksheet1 with the name of the worksheet}
MESSAGE "The worksheet is not open"
ELSE
MESSAGE "The worksheet is open"
END IF
```

In this example, we are simply displaying a message. Replace the message commands with code to perform the necessary operations for each case.

Crashing/Hanging when Launching Application

Some troubleshooting tips if your application crashes whenever you try to launch it

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.
Issue: Claris application crashes or freezes with a system error when launched or opened.

Solution: The issue may have one of several causes. The following are steps to correct this issue:

- Turn off Extensions (hold down the Shift key while restarting the computer). Launch the program to see if the issue is resolved. To determine which extension is causing the system error, you can use the Extensions Manager Control Panel to turn specific extensions on/off. When you determine which extension is the issue, you can replace or update it.

- If the issue persists, open the Preferences folder, inside the System Folder. Locate the file XTND Translator List. Delete it. Restart the Claris application. The file will be recreated.

- If the issue persists, the Claris Fonts file for the Claris application may be corrupted. First, delete the Claris Fonts file. This file is located in the Claris folder, which is inside the System Folder:
- for FileMaker Pro 4.0 or 3.0 - this file is called FM Pro Fonts
- for ClarisWorks 4.0 or higher - this file is called ClarisWorks Fonts
- for all other Claris Applications - this file is called Claris Fonts

Your Claris folder may contain one or more of these files. Delete the file that corresponds with the Claris application that won't launch. Restart the Claris application. The file will be recreated.

- If the issue persists, a font may be corrupted. To test this, create a new folder on the Desktop. Then, open the Fonts folder, which is inside the System Folder. Drag all the font suitcase files into the folder on the desktop. Restart the Claris application. If the application still will not launch, put all the font files back into the System folder and proceed to the next step. If the application launches successfully, one or more font files are damaged. To determine which font is corrupt, try putting half the font files back into the Fonts folder and relaunching the Claris application. Continue narrowing down the possible bad fonts in this manner. Throw out and/or reinstall any fonts that are corrupt. See also the article "System Freezing at the Splash Screen Spells Font Trouble."

- If the issue persists, rebuild the desktop (hold down the command and option keys while restarting the computer), then run Disk First Aid or Norton Disk Doctor. Disk First Aid is included on your System disks. Instructions are included in your computer's owners manual.

- If the issue persists, reinstall the Claris application. Turn off Extensions before reinstalling.

- If the issue persists, reinstall the system software.

- If the issue persists, update the hard disk driver. This is an invisible file on your hard drive. Updating the system software does not update the driver file. If your hard drive is an Apple drive that came with the computer, use the Drive Setup or HDSC Setup application. Be sure to use the latest version that comes with the latest system software. For non-Apple brand drives, contact your dealer or hard drive vendor for the latest version of their formatting software. You do NOT need to reformat the hard disk. Instead, run the formatting software and select the option Update, Install Driver, or Update SCSI driver. (The exact wording will vary depending on the software).

Claris Resolve: Title Borders

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
Borders around the spreadsheet title in Claris Resolve can be added or removed fairly easily by typing commands into the entry bar:

To Add a Title Border:
1. Type Select Report Header in the entry bar & then hit Command-Return which executes this script command immediately
2. Then type Single Line Border & again hit Command-Return

Some other options that are available are Double Line Border and No Line Border (to remove a border).

More information can be found in the on-line Claris Resolve Script Reference under the heading Select [More] Report Header.

TA41921_ClarisWorks_Superscripts_and_Subscripts.pdf

ClarisWorks: Superscripts and Subscripts

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
Superscript or subscript formatting will affect the spacing between lines on a one or one-and-a-half line spaced document. This also occurs in MacWrite II (all versions). Both programs are shifting to accomodate the height of the character being formatted. If the formatted character is in 9 point size, the only workaround is to use double-spacing between lines.

In ClarisWorks 2.0 and higher, a better workaround is to switch the paragraph formatting from lines to points, and then adjuct the point size as desired.

Apple System 7/ LaserWriter IIg/IIf & Font Printing Issues

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
Note: this is fixed with System 7 Tuneup 1.1.1

When I print the same document twice in a row, using either the IIg or IIf and TrueType fonts, the document doesn't print the second time.

This is a known bug in the ROM of both these printers. The work arounds are as follows:

Send a different print job down in between printing the issue document twice in a row.
OR
Use only ATM and Adobe fonts.
OR
Restart the printer in between.

MacDraw Pro: Conductor Compatibility Issues

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
This is fixed with Conductor version 2.7

Conductor is software used to image to film recorders by Agfa/Matrix, such as the SlideWriter. It accepts PICT images. When PICT images from MacDraw Pro 1.0v1 are imaged using the Conductor software (versions prior to 2.7), rotated text is not imaged (does not appear on screen or print to the film recorder).

This issue does not occur with PICT files from MacDraw II, so a temporary workaround would be to export or copy/paste to MacDraw II, then Save As a PICT file from MacDraw II.

Conductor owners can upgrade by calling the Agfa/Matrix parts department.

ClarisWorks: Transfer Data from FileMaker Pro for Mail Merge

A step-by-step guide to exporting your FileMaker Pro data to a ClarisWorks database for a mail merge

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
Here are instructions for moving your data from a FileMaker Pro database to a ClarisWorks database. Once moved, the data, such as names and addresses, can be used in a Mail Merge to print form letters.

Note: ClarisWorks 4.0 includes an AppleScript application, called Mail Merge, to automate this with FileMaker Pro 2.x. It is in the ClarisWorks Scripts folder inside the ClarisWorks folder, along with a read me file with instructions. A modified version of this application, called Mail_Merge.FMP3, is available for merging from FIleMaker Pro 3.0. It is available on the Claris ftp server at: ftp://ftp.claris.com/pub/USA-Macintosh/Templates/ClarisWorks/Mail_Merge.FMP3.bin. It is also available on America Online in the Software Libraries:ClarisWorks folder

Part One - Exporting the data out of your FileMaker Pro database
To begin we must export your data from FileMaker Pro. Following are the steps:

1. With your FileMaker Pro database on the screen, choose Export Records... from the Import/Export item of the File menu. If you are using FileMaker Pro 1.0 you will choose export from the file menu. Select "DIF" as the file type from the pop-up menu.

2. Enter a file name. It may be helpful to place the suffix .DIF after the name. (For example: MyNames.DIF)

3. If you are using System 7 (or later), click the Desktop button. Click on "OK".
In FileMaker Pro 4.0 or 3.0: In the Export Field Order dialog box, indicate how you want FileMaker Pro to export the data (check your onscreen help for more details. Search for: "exporting, data- Exporting data from FileMaker Pro".)

In FileMaker Pro 2.x or FileMaker Pro 1.0: In the Specify field order for export dialog box verify that each field you want to use in your mail merge has a checkmark to the left of it. Click to remove checkmarks from fields you don't want to export. Choose a format option for the fields. Click OK. You have now created and saved a data file.

Part Two - Bringing the data into ClarisWorks
Once you have the data file created from your FileMaker Pro database you must now bring that data into ClarisWorks. Follow these steps:

1. Launch ClarisWorks. Since you do not need a new document, click Cancel.

2. Choose Open from the File menu.

If you are using ClarisWorks 1.0, click on the Import Options flag and select database. With all other versions of ClarisWorks, select Database in the Document Type drop-down menu.

If using System 7, click the Desktop button. If not, navigate through your hard disk until you find the DIF data file you created in Part One.

Double-click on the file or select Open. The DIF file will be converted to a ClarisWorks database in a standard list style format. The layout structures from your previous FileMaker Pro file are not retained.

Part Three - Setting up the Mail Merge
With the data now in a ClarisWorks Database you are ready to complete the process by setting up and using the mail merge. Complete instructions for mail merge can be found in the onscreen help. Following is a summary of the steps.

1. Open your ClarisWorks word processing (or other) document.

2. Click within your document where you want the merged data to begin and choose Mail Merge... from the File menu.

3. After selecting the name of the open database, you are presented with the Mail Merge window. You can alternate between using the Insert Fields button to add merge fields to your document and typing into your document. Figure 1 shows a sample form letter with the Mail Merge palette window.

4. When you're done, press the Print Merge... button to print a copy of each record currently visible in the database merged into your current document.

When printing, ClarisWorks will remove lines that are completely blank and slide the rest of your data upwards. Although merged data will be visible only on the printout, use of a third party utility such as ClickBook or Print Previewer or printing to a Hewlett-Packard Printer with a print

preview option will allow you to preview the print image on the screen.

Claris CAD: Changing the Size without Changing the Dimensions

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.

Sometimes you might want to change the physical size of a drawing without changing the numbers shown in the dimensions on the drawing. This is easily accomplished in two steps.

In this example we want to scale the drawing by 50%.

1) Group the drawing and use the Scale command (under the Arrange menu) to scale the drawing by 50%.

2) Go to the Rulers dialog and reduce the actual (top) ruler's dimension by 50%.

MacDraw Pro: Font Issues Exporting to PICT

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
When saving to PICT (not PICT2) or copying to the clipboard with the color clipboard turned off, then importing into another program, text may have issues. The exact issues are unknown, but may include printing issues, or incorrect font/style/size information.

The issue is due to the system including a PICT2 comment into a PICT file. (When saving as PICT, the PICT file is generated by the system, not by the application). This PICT2 comment should not be in a regular PICT file, and is data regarding the text style. The best workaround is to use PICT2 instead.

Claris CAD: Setting Up More Than Six Dash Patterns

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
The Dashes.. dialog in Claris CAD can only display 6 dash patterns at once. However, you can have more than 6 patterns in your documents:

1) You can draw using the 6 dash patterns in the dialog, then change the patterns in thedialog and create new lines. (The dash patterns of the lines that you have already drawn will not change.)

or

2) You can use the Line Style floater (choose Show Line Styles under the Pen menu) to create many line styles with a different dash pattern for each style if you wish.

MacDraw Pro: Special Text Characters Not Exported to EPSF

Several text characters will not print (including ² ³ and) if included in an EPSF file exported from MacDraw Pro 1.0 or 1.5.
This article has been archived and is no longer updated by Apple.
These special characters may appear in the PICT Preview, but won't print. The workaround is to use Symbol font for these special characters. They will then print correctly when in an EPSF file.

The characters that require Symbol font to print in an EPSF are the following:
°, ², ³, ¶, ·, ,, ¹, º, ½, , Å, Æ, ×, ð

MacDraw: Text Word Wrapping onto Additional Lines

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
Issue: A document containing text may wordwrap some of the text onto an additional line(s). This may happen when a MacDraw II or MacDraw Pro document is created on one computer, then opened on another computer. Or it may happen when a MacDraw II document is opened in MacDraw Pro on the same computer.

Explanation: When a text block is created in MacDraw II/Pro, it has a defined width. However, differing font technologies (bitmap vs. TrueType vs. ATM) may produce characters of different widths. If a text block is created using one font type with narrower characters, then opened on another computer with a font type that has comparatively wider characters, MacDraw can't place as many characters on a line. It will then have to wordwrap the last word on a line to a new line below. The issue is most noticeable with stylized text (bold and italic).

The solution is to resize the text block so that the text block matches the original.

Claris Resolve: Version 1.1v1 Release Notes

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
About 1.1 Enhancements (released 4/92)

Excel 3.0 Import/Export.
Claris Resolve 1.1 can now import and export Excel 3.0 files. (Import/export of graphic objects and publish/subscribe links is not included. Macro conversions is also not supported.)

Host Access Support.
1.1 can execute DAL query documents created by third party access tools such as Brio Technology's DataPrism and Fairfield's Clear Access. In addition, Claris Resolve can also execute DataPrism "AutoRun" documents, providing access to host databases through not only DAL, but Pathworks, SQL-Net and Sequel Link as well.

Improved Printing Performance
Printing on postscript printers is up to 50% faster.

Copy as Pict
New item added to the Utilities menu.

Default Separator Change
Claris Resolve will now enter plus (+) signs instead of commas when selecting discontiguous cells in a formula. You can still get commas by holding down the command key while clicking on your second cell.

Installer Changes
There is now an option to install the Utilities scripts via the Installer's Custom Install section. They will not be installed when performing an Easy Install. Additionally, the utilities scripts will now be in their own folder instead of having to be placed into the Resolve Scripts Folder.

ClarisWorks: Pasting Graphics into Word Processing Environment

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.

If you paste a graphic object into a WP document with the text tool active, the graphic will be treated as if it were a piece of text. You can tab it to a new position, but you can't click on it with the arrow cursor and reposition it.

If you select the arrow cursor before you paste the graphic, it will come in as a graphic, with handles so that it can be resized or moved.

If the graphic is pasted using the arrow cursor, you can position it over text. You can change the stacking order and have the text appear over the graphic by using the Move commands under the Arrange menu.

ClarisWorks: Bad Range in Cell Formula After Undoing Insert Column

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
This is fixed in ClarisWorks 1.0v3.

Undoing an insert column in ClarisWorks 1.0v2 or earlier does not restore the proper range in formulas.

1. Select a column which is referenced as a range in a cell formula in another column.
2. Insert a column.
3. Then choose Undo.

Result:
The proper range is not restored in the formula. The result is "#REF!" and the word "BADRANGE" replaces the range in the formula.

ClarisWorks: Calculation & Summary Field Text Truncation

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.

When the result of a calculation / summary field in the database exceeds the width of the field, the text in that field will be truncated on the first line rather than wrapping to the second line. This will occur regardless of the vertical size of the field (the number of lines as formatted on the layout).

Currently there is no way in ClarisWorks to insert a return character into a calculation, therefore there is no workaround.

ClarisWorks: Copying/Pasting a Row while Retaining Formatting

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.

Situation: You want to insert a row into your spreadsheet file and you want it to have the formatting of the row above it. The issue is that if you copy and paste the row above or use Fill Down, you will get not only the formatting, but you will get all of the entries in those rows.

While there is no easy way to get the formats without the entries, you can do this:

1) Insert the new row.
2) Select and copy the row that you wish to copy.
3) Select the new row and paste.
4) Click into column A of the new row.
5) Hit 0 then tab. Hit 0 then tab again until you have cleared out all of the data in the row.

This works well except that in fields that are formatted as dates, you will get January 1, 1904 (date 0).

ClarisWorks: Opening Text Files in Spreadsheet or Database

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
Question: When I try to open an existing text file (Tab separated, DIF, SYLK) as a DATABASE using ClarisWorks import options open dialog box, I get only a Define fields box in a new database with only one field.

Question: When I try to open an existing text file (Tab separated, DIF, SYLK) as a SPREADSHEET using ClarisWorks import options open dialog box, I get an error message "Some data was outside of the document's range and could not be imported". When I click "OK" I get a new blank spreadsheet.

Probable cause of both issues: If you are using ClarisWorks application version 1.0v2, check the version of the ClarisWorks Translators file in the Claris folder within your System folder. If the ClarisWorks Translators version is 1.0v1, update it to 1.0v2. Restarting the Macintosh is not necessary. For ClarisWorks version 1.0v1, v2 and v3, the application version number must match the ClarisWorks Translators file version number for translations to work.

NOTE: ClarisWorks 2.0 does not require a ClarisWorks Translators file.

ClarisWorks: Renumbering a Database

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
No version of ClarisWorks includes a specific command to renumber existing records in a database, however, you can renumber existing records by using one of the following techniques. Be sure to back up your file before trying these.

For Clarisworks 4.0:
1. The database to be renumbered should already contain a field of type Number or Serial Number. Make sure that Show All Records is selected under the Organize menu. Sort the database in the order you want the records renumbered.

2. Define a new field of type Serial Number. ClarisWorks will automatically serialize your records in the the order in which they have been sorted. These new serial numbers will appear in this newly defined field.

3. Delete the old serial number field from your database, and place the new serial number field on the layouts where you would like it to appear.

For ClarisWorks 1.0 - 3.0:
1. The database to be renumbered should already contain a field of type Number or Serial Number. Make sure that Show All Records is selected under the Organize menu. Sort the database in the order you want the records renumbered.

2. Save the database in ASCII Text format. (Use the Save As command from the File menu.)

3. Open the text file as a new spreadsheet file. (Select Open in the File menu. Set the Document Type to Spreadsheet. Locate the text file and open it.)

4. Locate the column of cells with the serial numbers you want to replace. Click on the top cell in the column. Enter the starting serial number, then press Return. Type an "=" sign; click on the cell above; type "+1"; press the Enter key. Click into the cell with the above formula, and select the rest of the column below the cell as a range. Select Fill Down from the Calculate menu.

5. Use the Edit menu to Select All, then Copy. Use the View menu (Window menu on PCs) to select the database file.

6. In the database, choose Select All, then Clear from the Edit menu. Go into Layout mode and create a New Layout, of Standard type. Return to Browse mode and select Paste from the Edit menu.

ClarisWorks: Time Addition

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.

Question: How can I add up elapsed times in a ClarisWorks spreadsheet to get total number of hours? When I do the addition, if the result is over 24 hours, I only get the remainder. For example, I want to add 3 times together: 7 hrs 15 min, 12 hrs 20 min, 8 hrs 15 min. When I add them together I get 3:50! What can I do?

Solution: Format the times so that they are in 24 hour format (7 hrs 15 min =7:15) by selecting the "number" item under the format menu. Use the "sum" function as you normally would but display the result as a serial number by selecting a format of "General" or use a format of "Fixed" with a precision of 6.

The resulting number is in "serial format." The portion of the number that is to the left of the decimal point is the number of 24 hour days that have elapsed. The number to the right of the decimal point is the number of minutes and seconds that have elapsed. You can then use the "Trunc" function to discard the fractional portion of this serial number and multiply by 24 to convert to elapsed hours. So if the resulting serial number was 2.115589, using the "Trunc" function & multiplying by 24 would give me: 2*24= 48 hrs.

Similarly, you can use the "Hour," "Minute," and "Frac" functions to extract number of hours and minutes from the decimal portion of the serial number. For the example of the 3 numbers above, I would get a serial number result of 1.159722. Then I could perform the following calculations:

Hours1= Trunc (1.159722) * 24
Hours2= Hour(1.159722)
Minutes=Minute(1.159722)

Adding Hours1 and Hours2 would give me the total number of hours elapsed. The following formula displays the total number of hours and minutes in 0:00 format.

=(TRUNC(1.159722)*24)+(HOUR(1.159722))&":"&RIGHT("00"&MINUTE(1.159722),2)

ClarisWorks: Transferring Layouts Between Files

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
Question: Can I copy a layout from one ClarisWorks database to another?

Unfortunately ClarisWorks does not have this capability.

The workaround: Record a macro as you are creating the layout in the first file. Begin recording, then switch to layout mode, add fields and any graphics you may wish to add, resize fields, etc. Once you've finished the layout, stop recording.

Then open the second database and play back the macro. This method works even if the field names are not the same. (For example, if you've chosen to use the first five fields on the layout in the first file, the macro will place the first five fields on the layout of the second file - even if the two files have different field names).

AppleCD SC: Recognizes Four Formats

I want to use my AppleCD SC while running PC software on a Mac286 card. Is there any way to do this? The CDs I want to read are not available for the Macintosh yet.

This article has been archived and is no longer updated by Apple.
The only CD-ROMs accessible by the AppleCD SC are those that conform to one of its recognized standards. The available AppleCD SC drivers allow the Macintosh to read CD-ROMs in these formats:

HFS
High Sierra
ISO 9660
Audio

Mac286 can read any of these formats, but only as Macintosh files since that is the way the drivers present the files to the Macintosh OS. DOS drivers, which expect a CD-ROM drive attached to a card in a slot, have no way of communicating with the AppleCD SC and cannot read the CD-ROMs.

We recommend that you contact the CD-ROM vendor to see if they have versions available in one of the above formats. This would allow you to access the files directly without using Mac286 as a fix.

NOTE: Prior to being adopted by the ISO Committee, ISO 9660 was known as High Sierra. Although some minor changes were made to High Sierra during the ISO standardizing process, Apple's driver will enable you to read CD-ROM discs pressed in either format. The two format names are often used interchangeably.

Claris Resolve: Preventing Scripts from Opening

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.

Developers sometimes want to prevent users of their scripts from opening / seeing them. It is not possible to prevent a script from opening, however, the following script will prevent a user from opening a button script when placed in the worksheet script.

This means that even the creator of the script cannot open it. The only way to open a script with this function installed is to immediately press Command-period after requesting the script to open. This, of course,will not work if BREAK OFF has been executed prior to this function. It is suggested, therefore, not to use BREAK OFF in conjunction with this script!

****

```
on deactivate
call worksheet1:checkwindow()
end deactivate

function checkWindow()
if windowtype() = 7
close now
end if
end function
```

ClarisWorks: Microcom Networking Protocol

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
MNP or Microcom Networking Protocol is a system, present on many of today's more modern modems, that adds error checking and data throughput enhancing compression to a telecommunications session. If your situation is " I called... got a CONNECT message and then nothing happened! " you've experienced the joy of a failed MNP handshake! The approved way to avoid future occurrences of this unseemly behavior, is to disable the MNP features of your modem.

In the wonderful world of standards we find the AT command set. This uniform code of modem jargon specifies a large number of ways to disable MNP. A common method is changing \\N1 to \\N0. You really need to consult the owners manual of the specific modem you are using to find out the correct one. To enter a custom setting, hold the option key while accessing the modem selector popup in the Settings/ Connection dialog. You should see the word 'custom' at the bottom of the list. Select this option and edit the command string to alter the setting of the MNP portion. The 1.0 modem tool that shipped with ClarisWorks will not allow you to save the custom setting but the 1.1 tool available from your dealer or APDA will allow you to save it.

Another approach is to use V.42b standard compression instead of MNP. This will give the same functionality but will have less connection bugs and will be a little faster.

ClarisWorks: Replacing Data in a Database Field

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
FileMaker Pro has a Replace command to replace the contents of a field with new data for all records being browsed. However, since ClarisWorks 1.0 does not have a Replace command, you need to use a workaround. Here are three different methods to accomplish this.

EXAMPLE #1: Using a Macro
This method is good for auto-entering data into a blank field, or replacing the entire contents of a field with new data. (Note: ClarisWorks 2.0 adds auto-entry options features. See the TIP at the end of this article for more details.)

To define a macro to auto-enter or replace information, you must manually switch to each record, then replace the data in a field. Therefore, it's not practical to record a macro for more than about 5 to 10 records at a time. Nevertheless, if you need to replace the data in 100 records, its easier to record a macro that replaces the data in 10 records, then run the macro 9 times to replace the data in the remaining 90 records. Another disadvantage of this method is that it is not flexible. When a macro is recorded, it only handles replacing the data in a specific field with specific new data. Nevertheless, here is the technique to use:

Defining the Macro:
1. In Browse, go to the first record with the field you want to auto-enter the new data into. Click into this field.
2. Go to Macros in the File menu, then select Record Macro.
3. Give the macro a name and a keystroke, then click Record. (see Working with Macros in the ClarisWorks Handbook for more information)
4. Choose Select All in the Edit menu. DO NOT CLICK IN THE FIELD!
5. Type in the new data.
6. Choose Select All in the Edit menu., then choose Copy from the Edit menu.
7. Click the bottom page of the book in the Status Panel (Goes to the next record, leaving the cursor in the same field). Do NOT click in the next record to get there.
8. Choose Select All in the Edit menu..
9. Choose Paste from the Edit menu.
10. Repeat steps 7, 8 and 9 for as many records as you want to replace the data in (for a single macro).
11. To stop recording the macro, choose Stop Recording from the Macros sub-menu in the File menu.

Using the Macro:
1. In Browse, go to the first record with the field you want to auto-enter the new data into. Click into this field.
2. Run the macro. You can run this macro more than once to auto-enter into more records than are defined in the macro.

EXAMPLE 2: Using the Spreadsheet
This method involves moving the data to the spreadsheet, replacing the data in a column (field), then moving the data back to the database.
1. Be sure you're browsing only the records you want to auto-enter data into a field. You can use the Find command, or a combination of Match Records and Hide Unselected, or Show All Records to do this. Also, be sure you're in a layout that has ALL the text, number, date and time fields in your database.
2. Press the Enter key, or click on the white space of the layout (not in a field)
3. Choose Select All from the Edit menu
4. Choose Cut from the Edit menu
5. Choose New from the File menu. Create a new spreadsheet file
6. In the spreadsheet, choose Paste from the Edit menu. Your data is now Pasted into the spreadsheet
7. Click into the first cell in the column with the field data you want to replace or auto-enter.
8. Enter the new data, then press the Enter key.
9. Click on this cell again with the new data, then drag down to select all the cells in that column for all rows with data.
10. Choose Fill Down from the Calculate menu. The new auto-enter data will be entered into that column for all records (rows).
11. Choose Select All from the Edit menu.
12. Choose Copy from the Edit menu
13. Switch back to the database window (select the database file's name in the View menu). The database file's window will now be active.
14. Select Paste from the Edit. The records will be pasted back into the database.
15. Save.

EXAMPLE 3. Using Find/Change
Unlike the previously described examples, the Find/Change command can search and replace only part of the data in a field (say, a word or two), instead of completely replacing the field contents. This method cannot be used to auto-enter data into a blank field (you can't use Find/Change to search for a blank). See the ClarisWorks handbook for more information on Find/Change.

TIP: Since Find/Change searches and replaces data in ALL fields on your layout, create a layout that has only the field(s) on it that you want to Find/Change the data.

TA41958_ClarisWorks_Replacing_Data_in_a_Database_Field.pdf

TIP: (ClarisWorks 2.0): ClarisWorks 2.0 can auto-enter data into a field when a new record is made. If you think you'll want to auto-enter data into this field later (after the record has been created), consider this: instead of leaving this field blank, auto-enter some unique value into this field when the record is defined (say, an X). Later, you could then use Find/Change to find the X and replace it with updated data.

Palette XCMD: Closing External Windows Message

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
Both the Palette XCMD and the Picture XCMD -- and now the Movie XCMD -- will send a message to the current card signaling that a window is closing. These messages are, respectively, "closePalette","closePicture", and "closeMovie".

The parameters sent with the message identify the window that is closing: The first parameter is the window's name and the second parameter is the window's ID (window IDs are new in HC 2.1). The message is sent when the window closes, either via a click in a closebox, or by executing a "close window" statement.

Stack designers can define a "closePalette", "closePicture", or "closeMovie" handler to take care of any cleaning up or updating when a window is closed.

HERE IS ONE RESTRICTION- Don't try to close the window again within a closePalette, closePicture, or closeMovie handler. The script can STILL refer to the window, for example, getting (or even setting) the window's location. The script can also close other windows -- but HyperCard will crash if the script tries to close the window (e.g., close window id (the param of 2)).

Claris Applications: USA vs. British Installation Issues

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.

For Claris programs which use an installer, the USA installer will NOT WORK with British version software; a special "Brit. Installer" needs to be present. Also the program will have additional British disks (possibly program & reference - if that is where the spell checker resides). For Canadian customers with British versions, this may particularly be a problem.

Claris Resolve: Formatting a Number to Have Leading Zeros

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.

Q: How can I add leading zeros to a number?

A: Select the cells and choose Custom Format from the Format menu. Type zero ("0") as many times as you want digits in your number. A custom format of "0000" will yield a result of "0010" when "10" is entered in the cell.

Claris Resolve: Installing and using Host Access

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
DAL support for in Claris Resolve 1.1 requires the installation of the utility scripts. The easiest way to install these scripts is to use the installer and choose Utility Scripts in the custom section.

Once the scripts are installed, you simply need to launch Claris Resolve and choose "Run Autorun..." or "Run Query Document..." from the Utilities menu. A dialog box will be presented with a button for selecting your Autorun or Query document and whether you want to bring the data into a new worksheet or a specified range on the current worksheet.

The actual code for the host access support is handled by a Claris Resolve External located in the HostAccess script located in the Utility Scripts folder in the Resolve Samples folder. If you wish to use this external in a custom script, you may copy all the resources from this script using a utility such as ResEdit and paste them into your script or worksheet. You can study the HostAccess script for information on how to use this external.

Using Dow Jones Portfolio Evaluator 1.0 with a Super Serial card

This article has been archived and is no longer updated by Apple.
Dow Jones Portfolio Evaluator was designed to work with the Communications card; however, it also works fine with the Super Serial card after you make the change listed below in the DJPE program. The Communications and Super Serial card differ in these three ways:

* The location of the status and data registers are different.
* The status register bit arrangement is different
* The Super Serial card is switch dependent, while the Communications Card must be programmed entirely in software.

Place your Super Serial in slot 2, and then set its switches to:

switch: SW1 switch SW2
1 2 3 4 5 6 7 1 2 3 4 5 6 7
1 0 0 1 0 1 1 1 0 1 1 0 0 0
Note: These settings are not the same as for Dow Jones News and Quotes.

Next, modify the software as shown below:

1. Load Login
2. Unlock Login, then make these changes.

```
5710 ST=49321: rem addr of SS status
5720 DA = ST - 1: rem addr of SS data
5730 print : print chr$(4)"pr#2": print chr$(24)
5740 print chr$(4)"pr#0
5780 for I = 1 to len (I$):wait ST, 16: poke DA,
asc(mid$(I$, I, 1)): next I
5840 I = peek (772): if I = 8 then I = 1 : rem err flag
```

3. Save Login

4. Load Fetch
5. Unlock Fetch, then make these changes:

```
6910 wait ST, 16: poke DA, 17: rem Xon
7120 if IN = 1 then wait ST,16 : poke DA,19 : run
7200 if 5 * int (S / 5) <> S then wait ST, 16:
poke DA, 17: goto 7360
7300 wait ST,16: poke DA,17: rem Xon
7900 ST=49321: rem addr of SS status
7910 DA = ST - 1: rem addr of SS data
7920 print : print chr$(4)"pr#2": print chr$(24)
7930 print chr$(4)"pr#0
7970 for I = 1 to len (I$): wait ST, 16: poke DA,
asc ( mid$ (I$,I,1)): next I
8030 I = peek (772): if I = 8 then I = 1: rem err flag
```

6. Save Fetch

7. Bload Com22.obj
8. Unlock Com22.obj
9. Call -151
10. Enter 341:8 N 343:A9 N 34C:A8
11. Bsave Com22.obj,A$300,L$B1
12. Enter "fp" to enter Applesoft.

Claris Resolve: Cell Function Documentation Error

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
The Cell() function is available in Claris Resolve, however, it is not documented in either the manual or the online Script Reference Guide. Here is the definition of this function:

CELL()

This function returns the contents of the current cell. If the cell contains a formula, it returns the result of the formula, not the formula text. In the first example below, the CELL function could be used in conjunction with the Find command to locate the next cell in the worksheet with a value grater than 35. In the second example, if the current cell contains the value 348, the expression containing the CELL function returns 87.

Examples:

CELL() > 35
CELL()/4 returns 87

Related functions: CELLTEXT, INDIRECT, and INDEX.

Claris Resolve: Executing Custom Function Documentation Error

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
Documentation / Publications Error

On page 4-36 of the Claris Resolve Functions and Scripts Manual (U91-614-003A), there is an example explaining one of the ways to execute a custom function:

" Min (100,CalculateIndex())

If the custom function has been defined in a script attached to a worksheet other than the current worksheet, you must use the following format to execute the custom function:

Worksheet:FunctionName"

This excerpt implies that you do not need to specify the worksheet name if the custom function is defined in the current worksheet. This is incorrect. A custom function must always use the specified format (Worksheet:FunctionName or ScriptName:FunctionName) even if it is defined in the worksheet script of the worksheet in which it is used.

Claris Applications: How to Use MS-DOS TIFF Files

Access PC makes cross platform conversion automatic, but you can also use ResEdit or another utility to change the type and creator manually.

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
Q. I just transferred a TIFF file from my PC running MS- DOS. I want to open the file with MacDraw Pro, but it doesn't show up in the Open dialog box. Can MacDraw Pro read PC TIFF files?

A. MacDraw Pro can open most PC TIFF files. Because you can't see the TIFF file when using the Open command, the problem is the Macintosh doesn't realize the file is a TIFF-format document. MacDraw Pro and other Macintosh programs use the file's 'type' tag to determine whether it can open the file. Normally, Macintosh programs set this tag automatically when saving a file to disk. But because this file came from a PC, it doesn't have any type tag.

There are two ways you can open the PC file to be read by MacDraw Pro.

Use Insignia's Access PC
Access PC lets you tell your Macintosh that all files ending in .TIF should be treated as TIFF files and opened by MacDraw Pro when you double-click them. The program also lets you read PC-formatted floppies. For pricing and availability, contact

Insignia Solutions
526 Clyde Ave
Mountain View, CA 94043
(415) 694-7600.

Use a File Type Utility
This is more difficult. You open the file in any program that allows you to edit the file type attribute. These programs include Symantec's Norton Utilities, Central Point Software's Mac Tools, CE Software's DiskTop, Apple's ResEdit, and many shareware programs. Set the .TIF file's type to 'TIFF' (no quotes, all caps). How you do this varies with each program. If you make the change successfully, you can then open the file as a TIFF document in MacDraw Pro and many other Macintosh graphics programs.

MacPrint 1.2.3: Read Me File

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
Insight Development Corp.
MacPrint, Version 1.2.3
October 29, 1990

Insight Development Corp. is pleased to release version 1.2.3 of our MacPrint software.

LASERJET III and IIID SUPPORT

The LaserJet III and IIID drivers allow you to access the printer's internal fixed size and internal scalable fonts. This gives you greater selection when you need the speed and quality of printing with printer fonts, as well as greater flexibility in the point sizes you wish to use. The scalable fonts can be scaled to any point size from 6 to 999.75 in .25 point increments.

Note: Not all applications will support the use of all of the LaserJet III and IIID's internal font effects (rotation and large point sizes, etc.). Please see the application's user's manual for more information.

Internal fixed size
(plain, bold, italic)

LJ Courier, 10 &12 pt.
LJ Line Printer, 8.5

Internal scalable
(plain, bold, italic, bold + italic)

LJ CG Times
LJ Univers

You can now enlarge or reduce the size of your image, from approximately 10% up to 800% depending on page size. We have also incorporated data compression techniques in order to speed up transmission to the LaserJet III, reducing the total print time for an average page of bit-mapped text.

The screen fonts for the internal scalable fonts are in point sizes 9, 10, 12, 14, 18 and 24, each in 4 styles. These take up a total of about 200k of disk space. You may wish to remove the 18 and 24 point sizes of the fonts LJ CG Times and LJ Univers with the Font/DA Mover in order to save over 100k of disk space. The only penalty is that the on-screen appearance of these 2 fonts in larger sizes will be jagged. Nonetheless, they will print smoothly at 300 dots per inch.

In order to print with the LaserJet's internal fonts, select the appropriate LJ font from the application's font menu. Remember that selecting a font from an application's font menu will not format the document in that font unless you have selected (= highlighted or blackened) the text to be formatted. If you have not highlighted any text, only text typed from that point on will be in the selected font.

Some applications, such as MacWrite II, allow you to enter any point size of font, such as "8," "17," "99," etc., by selecting "Other" in the "Font" or "Size" menu, or in some other way. With such applications, you can use the scalable fonts at virtually any point size. Some applications, however, only allow you to choose point sizes from a menu. In applications like these, you will find your choices limited.

FONT MAPPER AND ADOBE TYPE MANAGER

1. A problem sometimes occurs when the Font Mapper is run with Adobe Type Manager. It is recommended that Adobe Type Manager be turned off (either through the control panel or by removing it from the System Folder) when running Font Mapper to create your screen fonts. MacPrint is fully compatible with Adobe Type Manager for normal printing operations, and may be turned on after the screen fonts have been created.

OTHER LASERJET NOTES:

1. LIMIT ON FONTS PER PAGE: Due to hardware limitations, the LaserJet series II and LaserJet+ printers can only print 16 distinct cartridge and/or internal fonts (LJ fonts) per page. Distinct fonts are those that vary by typeface, style, or size. This limitation does not apply if you're printing QuickDraw Graphics fonts.

2. INTERFONT FONT CARTRIDGES BY INTERCON ASSOCIATES: Four Interfont font cartridges by Intercon Associates are documented in Appendix B, MacPrint Font Cartridges. In Appendix B these font cartridges are identified by their Intercon Associates' part number. In MacPrint's FONT MAPPER and in the CHOOSER, these same font cartridges are identified by the font cartridge name. Intercon

WPC-PL1-HE is Interfont Humanist 601. Intercon WPC-PL1-DE is Interfont Dutch 801. Intercon WPC-PL1-SE is Interfont Century 701. Intercon WPC-PL1-CE is Interfont Swiss 721 I8. In addition, MacPrint supports another font cartridge from Intercon Associates. This new cartridge is Interfont Swiss 721 E8. This cartridge contains the same fonts as Interfont Swiss 721 I8, but uses the Roman-8 symbol set, rather than USASCII. Currently the Swiss 721 E8 cartridge is only available in Europe.

3. "FASTER, BUT MAY PRINT HIDDEN OBJECTS": A new check box has been added to the print dialog box for the LaserJet series printers, which has the title "Faster, But May Print Hidden Objects." When selected, pages containing lines and rectangles will be printed much more quickly, as the internal drawing capabilities of the printer are used. This approach does not support the recognition of "hidden lines" though, so the resulting page may not look correct under all circumstances. Problems are most likely to arise when using object oriented drawing programs such as MacDraw or Canvas, where overlaying of objects is a common method of creating the final image. This feature is most useful when used with images such as spreadsheets or pages with borders. Those lines are converted to graphic elements that can be transmitted very quickly to the printer, bypassing the much slower (though more precise) bitmap imaging that is done when this feature is not activated.

4. PDP 25-IN-1 FONT CARTRIDGE: The PDP 25-in-1 font cartridge uses different character widths for the portrait and landscape versions of some fonts. There is no satisfactory way for the Macintosh to change font characteristics when a document shifts orientation, so this causes problems with MacPrint. It is recommended that the following fonts not be used from this cartridge in landscape mode: Times 10 pt, Helvetica 8 pt, and Helvetica 10 pt bold. If these fonts are used, the output will not have proper character spacing.

5. PDP 25-IN-1 FONT CARTRIDGE: There are two font cartridges sold by PDP under the same name, both of which are now supported in MacPrint. The original cartridge came with black diskettes in the box and claimed support for "103 fonts and symbol sets." This cartridge does not have many of the characters needed for non-English text, and is supported in the Font Mapper and Chooser lists as "PDP 25-in-1 -- 103 Fonts." PDP now ships this cartridge with blue disks, and boasts "173 fonts and symbol sets." This new version adds a couple of fonts, but perhaps more important, adds support for non-English language text characters. This version of the cartridge may be accessed in the Font Mapper and Chooser as "PDP 25-in-1 -- 172 Fonts."

DESKJET NOTES:

1. LANDSCAPE PRINTING: A late addition to MacPrint 1.1 now allows you to print in landscape orientation on the DeskJet and DeskJet PLUS printers using the Printer Font method of printing. However, due to hardware limitations of these printers, you cannot combine landscape Printer Fonts (DJ fonts) and graphics in the same document. Since QuickDraw Graphics fonts are printed using the printer's graphics mode, this means that you cannot combine landscape Printer Fonts and QuickDraw Graphics fonts in the same document. Therefore, the Page Setup dialog for the DeskJet and DeskJet PLUS printers has changed. If you select landscape printing in Page Setup, you must select either QuickDraw Graphics only or Printer Fonts only. If you select QuickDraw Graphics only, all fonts, including DJ fonts, are printed as bitmapped fonts. Since the DJ fonts do not include the four times font size required for High Quality printing, any DJ fonts you print using the QuickDraw Graphics method will appear in Low Quality. If you select QuickDraw Graphics only and you want High Quality output, you must use a font for which you have the four times size available. The CS fonts supplied with MacPrint are excellent choices, since we have supplied you with large sizes of these fonts. If you select Printer Fonts only, you cannot include graphics in your document; this includes QuickDraw Graphics fonts. You can only use DJ fonts that are available in landscape orientation. Please see Appendix B, page 139, for a list of the landscape fonts available on these printers.

2. LANDSCAPE PRINTING - WHEN THE RECTANGLE RULE FAILS: Normally, if you're using the Printer Font method and you try to print a Macintosh symbol which is not found on the cartridge or internal font you've selected, the character will be printed as a rectangle. However, this rule fails if you're printing in landscape orientation on the DeskJet or DeskJet PLUS because the rectangle is a bitmapped character. Bitmapped characters cannot be printed if you've selected Printer Fonts only. Therefore, if you try to print a character not found on the cartridge or internal font, nothing will be printed for that character.

3. DESKJET PLUS FONT CARTRIDGES: Four new font cartridges have been added to the DeskJet PLUS driver. These new font cartridges (R, T, U, V) will work only in the DeskJet PLUS printer, and are therefore not selectable under any other MacPrint printer driver.

ClarisWorks v1.0v3: Release Notes

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
The following issues were fixed in version 1.0v3 of ClarisWorks:

General

1. In 32-bit mode with 18 or more MB of memory, closing the Help menu corrupts the heap.
2. If a stationery document is anywhere on the hard disk but at the root level, the ClarisWorks Stationery filter in the Open dialog will not see it.
3. Empower II 4.0 prevents ClarisWorks from opening saved files.
4. ClarisWorks could not handle upper ASCII characters as command shortcuts.
5. On the Macintosh SE/Classic , ClarisWorks will not use the LCAL setting for eight color palette width the first time you click on it.
6. When ClarisWorks is used with FileGuard installed, it is impossible to open documents.

Word Processor

1. If space between columns is increased and you change the size of text in the footer, it thrashes the columns created.
2. If a Change All for a Footnote is done in the Footnote panel, the application will crash with a Bus error.
3. Enter a underlined text into first and third line of a document. Printing this document to a StyleWriter or Personal LaserWriter LS prints a dot at the start of the second line.
4. Printing TrueType Fonts to StyleWriter or Personal LaserWriter LS puts an extra space at the start of a new paragraph.
5. When a MacWrite II document that used Auto Hyphenate is imported into ClarisWorks, formatting becomes corrupted.
6. There are compatibility issues running Thunder 7.
7. There are various repagination issues including very slow pagination on large documents.

Database

1. Create some and hide some records. Go to the Find mode, type text, check the Omit Check box, click All. It will only find the records from the visible (not ALL) records.
2. Create a spreadsheet frame with data and select Open Frame. The Make Chart menu is dimmed.
3. Create a summary field, go to Layout and create a new layout. The Body parts shifts down .5" in.
4. Omitting multiple records causes all data in the database to be found.
5. Sliding does not always work when printing to an ImageWriter.

Graphics

1. Freehand or smoothed polygons do not print on a DeskWriter C.
2. Line widths all print the same width on a DeskWriter C.
3. There are issues printing filled smooth polygons when you are NOT using Print Monitor.
4. There are some issues printing objects with fill patterns. They are not WYSIWYG.

Spreadsheet

1. Creating a 3-D bar chart with data that includes a zero. If you select LOG, system will crash.
2. Formulas on an AppleWorks 3.0 spreadsheet do not import correctly and/or sometimes missing.
3. Under certain circumstances, you will receive BADRANGE in cell A1.
4. Sorting does not work correctly in a column with formulas that contain Division or Multiplication operators.
5. StDev function cannot reference more than 181 cells.
6. Cannot use underscore or dash characters.
7. Some gradualness print more heavily than others when printing to a LaserWriter.
8. Mr. Bus Error will cause a spreadsheet to crash when opening a SYLK file.
9. There are issues saving files out as Excel 3.0 and then opening them back up.

ClarisWorks: Changing Font Styles of a Chart‘s Number Series

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.

If you want to make style changes to elements of a chart created in the spreadsheet environment you might refer the section "To create a chart" of the ClarisWorks Handbook which states, "Any changes you make to the font, size, or style in the spreadsheet appear automatically in the chart." This feature is quite apparent when changing the style of the category series or the legend.

However, if you want to change the font, size, style, etc. of the number series, you need to make the desired changes to the top left cell (anchor cell) of the range of numbers used to create the chart.

For example, you might have a range of data from cell A1 to D4, where row 1 is used for the chart categories and the numerical data for the chart is in the range B2...D4. The cell B2 represents the anchor cell for the data used in number series of the chart and any style changes made to this cell will automatically be reflected in the chart. Changing the style of any other cell in the range B2...D4, even if every cell in that range except B2 is changed, will not be reflected in the number series of the chart.

ClarisWorks: Database Not Printing Page One

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.

Problem:
The customer prints out of the database and the first page is missing.

Solution:
Title Page is selected in the Document window under the FORMAT menu.

In versions previous to 1.0v2, this caused a crash but now it just causes this symptom.

ClarisWorks: Extracting Names From a Field

How to extract the first, middle and last names from a full name field when these items are separated by spaces.

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
Given that FULLNAME is a text field in a ClarisWorks database and that data is consistently entered with first, middle and last names all separated by a space, here are calculations to extract the first, middle and last names:

FIRST (CALCULATION, TEXT RESULT)=
LEFT('FULLNAME',FIND (" ",'FULLNAME',1)-1)

MIDDLELAST (CALCULATION, TEXT RESULT)=
RIGHT('FULLNAME',LEN('FULLNAME')- FIND(" ",'FULLNAME', 1))

MIDDLE (CALCULATION, TEXT RESULT)=
LEFT('MIDDLELAST',FIND(" ",'MIDDLELAST',1)-1)

LAST (CALCULATION, TEXT RESULT)=
RIGHT('MIDDLELAST',LEN('MIDDLELAST')-FIND(" ", 'MIDDLELAST', 1))

Notes for calculations:
1. Each of the fields is a calculation field with the result formatted as text.
2. Double quotes in the calculations have a space between them.
3. The MIDDLELAST is an interim field that need not show on your layout.
4. When a new record is added and there is no entry in the FULLNAME field, any calculation fields showing on the layout will show #ERROR! until data is entered into FULLNAME.split

EtherTalk NB Card: Can Run Both EtherTalk & TCP/IP

Can you run EtherTalk and TCP/IP on our EtherTalk NB Card at the same time?

I need a workstation that runs MarketMax (an EtherTalk-based, client/server data feed service), has four 3270 sessions running (I'm thinking of the Netway 2000 with EtherTalk option), and has MacX for X Window System to their Sun servers (that's where TCP/IP comes in).

Will this work, and what do you think traffic will look like (MarketMax puts very little traffic on the Ethernet)? Alternative solutions might be to use a Coax/Twinax Card and MacDFT for the 3270 sessions, or use a GatorBox for the Sun sessions.

This article has been archived and is no longer updated by Apple.
There should be no problem sharing the EtherTalk NB Card between EtherTalk and TCP/IP.

It is not clear whether you need many workstations or just one, and if many workstations are required, whether you need distributed sessions on those stations.

Depending on the number of workstations to be connected to the mainframe, Tri-Data Netway 2000 from Tri-Data Systems is certainly a solution; however, it might be overkill for one workstation.

Running MacDFT using the Coax/Twinax Card will work, but you will need to connect to an IBM 3X74 controller. Running MacDFT 1.1 using the Serial NB Card, you can have SNA connectivity to the host via a Front End Processor.

You can also run Avatar MacMainFrame 3.5 (from Avatar, Inc.) using Avatar SNA/SDLC card and distribute the sessions to LocalTalk, EtherTalk, or TokenTalk.

It is difficult to predict the traffic without knowing about the network topology, the number of workstations, and the applications. Of the applications you mentioned, MacX might be the one with the most traffic, but this should be fine with one workstation.

For more information, search under: "DCA (formerly Avatar)" and "Tri-Data Systems"

Article Change History:
26 July 1993 - Company title changed from Avatar to DCA (Digital Communication Associates).
3 May 1990 - Updated for technical accuracy

ClarisWorks: Field Format of a Text Field

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
This has been fixed in version 2.0.

The database environment's "Field format" command (under the OPTIONS menu when you are in Layout mode) only works for number, date, time and summary fields, as well as calculation fields that return a number, date or time result.

If you are in layout mode and have no fields selected, the "Field format" menu choice will be gray. However, even though there are no field format options available for text fields, if you select a text field, the "Field format" menu item will become available (instead of being grayed-out, as you would expect). If you select it, nothing will happen. This makes it appear that ClarisWorks isn't performing properly.

ClarisWorks: Losing Contents of Clipboard

If you copy an item to the clipboard, paste it into ClarisWorks, switch to another application, and then go back to ClarisWorks, the clipboard contents may disappear.

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
This does not happen in ClarisWorks version 2.0.

Sometimes it seems as if ClarisWorks 1.0 can lose the contents of the clipboard. To demonstrate this:

1) Make sure another application is running while in System 7 or 6.x with MultiFinder
2) Launch ClarisWorks and open a document (preferably in the Graphics environment)
3) Open the Scrapbook and copy something to the Clipboard
4) Paste picture into ClarisWorks document-no problem.
5) Switch to the other application and then back to ClarisWorks
6) Try pasting picture. Nothing happens. It seems as though the contents of the clipboard have been erased although you will be able to paste the picture into your other open application

This issue will not happen if you copy a picture from ClarisWorks to the Clipboard and move between applications. Additionally, after you perform step 4, open the clipboard from ClarisWorks. When you switch applications in Step 5 and return to ClarisWorks, the clipboard window will still show the picture you copied even though you can't paste it. Close the window and open it again and you will have an empty Clipboard window.

Likely Explanation & Workaround:
In both System 7 and System 6 with MultiFinder, applications have the opportunity to check to see whether the contents of the clipboard have changed when responding to suspend and resume events (sent when you move between applications) so that the state of the Clipboard is properly handled.

In all likelihood, ClarisWorks is misinterpreting some of these events (probably the resume event) so returning to the application replaces the contents of the scrapbook with ClarisWorks empty private scrap. That's why copying a picture from ClarisWorks will not duplicate the problem-it's private scrap is not empty. On the positive side, it still manages it's responsibilities when you go to another application properly-that's why the contents of the Clipboard are OK when you go back to another application.

Additionally, according to Inside Macintosh, the clipboard window should be hidden when switching applications.

ClarisWorks: Non-Standard Results Printing from Finder

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.

Unlike most applications, and contrary to Apple's Interface Guidelines, ClarisWorks and ClarisImpact present the Print dialog box for each document when printing multiple documents from the Finder. All other Claris applications present the Print dialog box once, and then print all documents based on the specified settings. You do not have to confirm for each document.

There is no workaround at this time.

ClarisWorks: Printing with the HP DeskWriter

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.

Problem:
When printing a database (and maybe other document types as well) to a Hewlett-Packard DeskWriter you may get an "Insufficient Memory" message.

Solution:
Increase the application memory for ClarisWorks to about 1500K. This should alleviate the situation.

Other things to check are the version of the DeskWriter driver. Do this by going to Print under the FILE menu. Just to the left of the "Ok" button you will find the version number (other printers use a "Print" button). The latest DeskWriter driver version is 6.0.

If the driver is not at least version 6.0, contact Hewlett-Packard to get a new driver. Some older drivers start with "A" or "0A". These drivers are outdated and must be replaced.

Hewlett-Packard's Technical Support number is (208) 323-2551.

ClarisWorks: Auto-entering Today‘s Date

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
ClarisWorks 2.0 supports auto-entered date fields as well as many other automatic entry options.

ClarisWorks 1.0 does not support auto-entered date fields, but you can auto-enter today's date into a calculation field. The formula for the calculation field is just the NOW( ) function. The calculation field should be set to result in a date. The NOW ( ) function is not updated when the file is opened on a later date, so the date entered will not change.

Alternatively, you can auto-enter today's date and display it as a formatted date. Define a calculation field (to result in Text) with this formula:

TodayDate (Calculation, Text result) = DATETOTEXT(NOW(),x)

where x= 0,1, 2, 3 or 4 (date format choice) format the date as per the following:

0= 2/23/91
1= Feb 23, 1991
2= February 23,1991
3= Sat, Feb 23,1991
4= Saturday, February 23, 1991

However, there are a few considerations...
1. This field will contain a text value that cannot be sorted like a normal date field.
2. This text value cannot be used in other date calculations because it really is text.
3. You cannot match records using this in a date calculation.
4. These values will not have any particular range, so there is no less or more than this field.

ClarisWorks: Extra Quotes in Imported Excel SYLK File

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
Excel files saved out as SYLK will have quotation marks around the contents of any cell that contains a comma. This can be a problem when importing data into ClarisWorks, MacProject II, and Filemaker Pro.

If your Excel file has the data under the columns First, Last, Party, Motto like this:

First Last Party Motto
George Bush Republican If you can't join em, beat em.

then it will export as: George,Bush, Republican," If you can't join em, beat em."

1. To remove the quotation marks, open the SYLK file in a word processor, search for the quotations and replace them with nothing. You will also need to remove the comma from that field, or else it will be imported as two fields because the comma will be seen as a delimiter. Or, instead of removing the comma from the field, you could replace it with an unusual constant such as "XXX" and then replace the constant later once you have imported the file into its destination application.

2. Then export the file as text. The XTND filter for SYLK looks into the file itself to see if it is a SYLK file so you don't have to worry about the file being saved as text rather than SYLK.

MacDraw Pro: Opening MacDraw 1.9.x Files using HyperCard

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
This is fixed in MacDraw Pro 1.5

Using HyperCard to open MacDraw 1.9.x documents in MacDraw Pro 1.0v1 does not work.

This command should launch MacDraw Pro and open a MacDraw 1.9.x file named MDdoc:

"Open MDdoc with MacDraw Pro"
Instead, it opens a blank, untitled document.

This command works correctly for all other openable file types. For example:
"Open MW2doc with MacDrawPro"
will open a file named MW2doc into MacDraw Pro, even if this file is an EPSF, TIFF, PICT, MacWrite II or any other openable file.

Claris Resolve: Creating High-Low, XY and Scatter Charts

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
When High-Low, XY and Scatter charts, multiple columns or rows of data represent a single series. A High-Low chart with six columns of data, for example, would create 2 series. The first series represents the first three columns of data and the last three columns are plotted in the second series. XY and Scatter charts work in a similar manner but only use 2 columns or rows per series.

Rows and columns of data must be contiguous and odd rows or columns are ignored. If you tried to create an XY chart based on 5 columns of data, for example, the 5th column would remain uncharted because it does not complete a pair. Series labels are taken from the top-left cell of each pair (if it contains text). Defining series labels, therefore, must contain 2 or 3 cells for each series even if the 2nd and 3rd cells are blank.

Sometimes the data may not be laid out on the worksheet in a manner that allows the easy creation of this type of chart. You may have three columns of data, for example, that you want to chart in an XY format with the first column the left series in each pair. To create a chart from such data, use the following procedure:

1. Select the first two columns or rows. Claris Resolve defaults to using columns, however, this can be changed by selecting Rows from the pop-up menu in the Chart Options dialog box.
2. Create your chart.
3. Display the series dialog box by double clicking on the series label in the chart legend or selecting the label and choosing Series from the Chart menu.
3. Click the Duplicate button. This will create an exact duplicate of the first series.
4. Bring up the Series dialog box for the duplicate series and change the range, symbol and symbol color.
5. Click OK.
6. Repeat steps 3 through 5 for each series you want to add to the chart.

NOTE: The Data Range field in the Series dialog box will contain either 2 ranges (XY and Scatter charts) or 3 ranges (High-Low). These ranges will be separated by semi-colons. When changing the range information for your duplicate series, you usually only need to change one or two of these ranges. If the layout of your data conforms to the example cited above, you would leave the first series alone and change just the second.

MacDraw Pro 1.5v1: Product Fact Sheet

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.

Product Description:
MacDraw Pro 1.5 is the high-speed upgrade of the best- selling Macintosh graphics software for designing, illustrating, publishing and presenting.

MacDraw Pro 1.5 offers full System 7 support - including QuickTime - and performance improvements making it faster than version 1.0. MacDraw Pro continues to offer superior color support, unparalleled file exchange capabilities and complete content control.

New Features of MacDraw Pro 1.5:

- Text entry and redraw is up to 4 times faster, using improved algorithms which improve speed without accuracy loss.
- Text printing is two to five times faster (especially non- PostScript).
- Improved Fast Gradient display is up to five times faster than Best Quality display, with smoother visual representation.
- Launch time is reduced, and pop-up palettes are pre- drawn on program launch for better program "feel" and responsiveness.
- Other optimized functions including drawing, scrolling, rotating, and selection now 20% to 200% faster.

New RAM-scalable performance
- Open more documents with less memory.
- Use all available colors without memory restrictions (4MB no longer required for millions of colors).
- Speed redraw and scrolling performance by allocating additional RAM.

Full System 7 support ... and more
- Complete Publish & Subscribe support includes the ability to publish objects on a specific layer or across layers.
- QuickTime movies act as other objects and may be incorporated into drawings or presentations.
- Apple events allow MacDraw Pro to be "driven" by other applications. A sample Claris HyperCard stack is included which works as a timed slide-show controller (HyperCard sold separately; version 2.1 required).
- TrueType font support
- Balloon Help now complements Claris HyperHelp.
- Tile and select windows functions easily with the Windows menu.
- Select objects by color (or other fill).

Continuing Strengths of MacDraw Pro 1.5:

Extensive color support
- Takes full advantage of 32-bit color QuickDraw, displaying up to millions of colors.
- Automatic color approximation (dithering) allows users to display more than 2,000 approximated colors on a 256 color (8-bit) card.
- Multiple palettes open simultaneously to enable users to easily create blends or group complementary colors
- Ideally suited for mixed color and monochrome environments with features like "named colors," which allow users to easily elect colors, even on monochrome monitors.

File Exchange Capabilities
- Claris XTND architecture allows users to easily open, work with and save documents in a variety of industry standard file formats such as PICT, Color PICT2, MacDraw II, EPSF and other graphic and text file formats with translators supplied by Claris and third parties.

Complete Content Control
- Standard word processor ruler features in each text block allow users to position text precisely with left, right, center and decimal tabs, line spacing, letter spacing, and paragraph spacing control.
- Superscript and subscript allow users to create scientific notations and add common symbols to text.
- Polygon and new bezigon tool allow users to create and edit curves easily without bezier tangency controls, and access full bezier curvature when needed.
- Three editable gradient types offer professional shading effects to add depth and highlights to graphics. Up to four colors can be chosen for each gradient.

- Text and graphics can be precisely rescaled by percentage to fit an area.
- Full featured palette control with floating or "tear-off" palettes and a Finder-like interface for quick palette creation.
- Options available for more precise positioning of objects while drawing include the ability to zoom while drawing; duplicate while dragging; activate or deactivate grid snap while drawing; and edit points while drawing polygon and bezigon objects.
- Precision zooming from three to 3,200 percent, in 1 percent increments, allows users to maximize screen space.
- Keyboard shortcut support for quicker navigation through dialog boxes.
- Library feature allows addition or removal of named objects directly in library window for simple maintenance.

Built-in Slide Presentation Functionality

- Full on-screen presentation capability provides flexibility in delivering presentations with support for remote control devices and screen blanking.
- Layer/slide support allows users to copy and paste multiple slides or layers from one document to another for easier document and presentation management.
- Reorder slides or layers by dragging to quickly organize drawings and presentations.
- Semi-modal dialog box allows users to view changes before approving them.

Target Customers:

Business Professionals use MacDraw Pro for creating business presentations, free-form business charts, casual scaled designs, simple desktop publishing projects and enhancing graphics created by other applications or clip-art libraries (purchased separately).

Graphic Designers and Illustrators use MacDraw Pro for on-time deadline and informational graphics and illustrative graphics with the ability to work in full color, work with more precise curve tools and directly save Encapsulated PostScript (EPSF) files.

Engineers and Architects use MacDraw Pro for basic drafting, conceptual design, floor plans, architectural renderings and a number of other tasks that require drawing in scale.

In-Package Support Materials:
- Users Guide
- Color Guide
- Getting Started guide with tutorial
- On-line Guided Tour and Sample files
- Context-sensitive, customizable HyperHelp system

Support Services for Registered Owners:

Customer Relations
- Maintains registered customer database
- Handles non-technical questions, i.e., registration status, etc. Phone: (408) 727-8227
- Phone lines staffed from 8 a.m. - 5 p.m. PST, Monday through Thursday and 8 a.m. - 2 p.m. PST, Friday
- Phone: (800) 544-8554 for product upgrade order forms and instructions

Technical Support
- Dedicated team of Technical Support
Specialists.resolve technical software questions and problems
- Phone: (408) 727-9054
- Phone lines staffed from 6 a.m. - 6 p.m. PST, Monday through Thursday and from 6 a.m. - 2 p.m. PST, Friday

System Requirements and Compatibility:
- Macintosh Plus and all later Macintosh models
- Hard disk drive
- 2 MB RAM required (2 MB for System 6; 4 MB for System 7)
- System 6.0.5 or higher, or A/UX 2.0 or higher
- 32-bit QuickDraw required for color

MacDraw Pro 1.5v1: Upgrade Announcement

Claris upgrades MacDraw Pro with major performance enhancements and complete System 7 support.

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
SANTA CLARA, Calif., May 18, 1992 - Claris Corporation today announced MacDraw Pro 1.5 software, the high-speed upgrade to the best-selling graphics program for the Macintosh. The new version offers up to four times the speed of Version 1.0 and exceeds the Macintosh graphics performance standards set by MacDraw II. Major performance enhancements within Version 1.5 include user-controllable memory buffering and display options that improve the speed of on-screen display and printing, allowing for improved interactivity and handling larger-scale design and drawing tasks on a greater range of Macintosh CPUs.

Full System 7 support -- including QuickTime, Publish & Subscribe, and Apple events -- further bolster MacDraw Pro's position as the leading graphics solution for presentations and for workgroup environments.

"Mac users have made MacDraw Pro the best-selling graphics solution," said Steve Pollock, Claris director of product marketing. "We are confident that MacDraw Pro 1.5 meets the expectation of users and is the perfect blend of features, full System 7 support and high performance to best meet the graphics, design, illustration and presentation needs of typical Macintosh users."

Up to 4 times faster than Version 1.0
MacDraw Pro 1.5 speeds graphics creation with several improved performance factors:
- Text entry and redraw is up to four times faster, without any loss of accuracy.
- Text printing is from two to five times faster.
- "Fast Gradient" display is up to five times faster than the "Best Quality" display. Gradient can be tuned to the resolution of the output device.
- Other optimized functions -- which are from 20 percent to 200 percent faster -- include drawing, scrolling, rotating, and object selection.
- Greeking options allow users to display placeholders for complex graphics and text and image objects providing significantly faster redraw performance within detailed documents.

Full System 7 support
MacDraw Pro 1.5 new System 7 features include Publish & Subscribe capabilities, Apple events, QuickTime support, Balloon Help, and TrueType. Complete Publish & Subscribe support includes the ability to publish partial or complete objects from a user-specified combination of layers.

MacDraw Pro 1.5 users may now publish graphics, i.e., logos and charts, that are created in various applications and shared within a workgroup. In addition, users may also subscribe to charts created in applications such as Claris Resolve and other spreadsheet programs for more effective workgroup computing.

With Apple events users can "drive" MacDraw Pro from other applications, such as the HyperCard program. A sample HyperCard stack that works as a timed slide-show controller is included with MacDraw Pro1.5.

With QuickTime, users may enhance on-screen presentations with video, animation and sound.

Continued strengths of MacDraw Pro 1.5
Since its inception, MacDraw has continually set the standard fo0r business graphics on the Macintosh, making it the number-one choice of Macintosh users. Today, MacDraw Pr" 1.5 features extensive color support, state-of-the-art file exchange capabilities and leading edge gradient fill and text handling capabilities. New users will appreciate the familiar Claris family interface, including zoom tools, a favorites tool bar, the text ruler, and tear-off palettes. Professionals can take advantage of 32-bit color QuickDraw, and extensive, customizable gradient options.

In addition to general purpose drawing and graphics tols, MacDraw features on-screen slide presentation capabilities. The layer/slide support allows users to copy and paste multiple slides from one document to another for easier presentation management.

MacDraw Pro: Expressionist Equations not Pasting Properly

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
Equations created in Expressionist will not paste properly into MacDraw Pro 1.0v1. (Greek characters shifted up above the equal sign, etc.). The issue was also evident using MacDraw Pro 1.5.

Expressionist Tech Support confirms the following:
1) The current version of Expressionist as of May, 1992 is 2.07 (though updating probably wouldn't fix this issue).
2) They receive calls from MacDraw users of this issue
3) Suggested workaround (which sometimes helps): After pasting the equation into MacDraw Pro, Ungroup it several times. Then, move the characters into the proper position.
Published Date: Feb 18, 2012

MacDraw: Printing Phantom Arcs to StyleWriter

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.

MacDraw II and MacDraw Pro drawings with arcs may print incorrectly to a StyleWriter or LaserWriter LS. The printout may contain "phantom" extra arcs that do not exist in the drawing. These phantom arcs look as if their center points are the same as the drawn arcs. This appears to be an issue with the print drivers, as these same arcs print incorrectly from Canvas and SuperPaint as well. To reproduce the issue:

1- draw one or more circular arcs, with a 4¡ arc, from 268¡ to 272¡
2- print to a StyleWriter or LaserWriter LS

However, a 4¡ arc from 266¡ to 270¡ prints correctly.

Published Date: Feb 18, 2012

MacDraw Pro & Claris Resolve: Printing Two-color Patterns

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
Printing two-color patterns from MacDraw Pro or Claris Resolve to a Postscript printer will result in incorrect printing of the patterns. (A two-color pattern has a background color that is non-white).

To print color patterns directly to a Postscript printer, you need a Postscript Level 2 print driver (e.g., LaserWriter 8 driver) and a Level 2 printer (e.g., IIf, IIg, LaserWriter Pro).

To print color patterns with an older printer driver or printer, save to an EPSF file from MacDraw Pro, open or import the EPSF file, then print.

If saving to an EPSF file, you must use the EPSF XTND translator included with MacDraw Pro 1.5v2.

Claris Resolve: Charting Discontiguous Ranges

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
Claris Resolve does not allow you to select discontiguous ranges when charting, however, you can create charts based on discontiguous ranges by using one of the following techniques. The technique you use depends on the physical distance between the ranges being charted. These techniques apply for all chart types.

If your ranges are located close together:

1. Select the entire range including the area you don't want included and chart it.
2. Double click on the series item in the legend of the chart you do not want (or select it and choose Series from the chart menu). This will present the Series dialog box.
3. Click on the Delete button to delete the series from the chart (this will not affect the data on the worksheet).
4. Repeat steps 2 and 3 for each unwanted series.

If your ranges are widely separated on the worksheet:

1. Select the first contiguous group of data and chart it.
2. Double click on the series item in the legend of the chart just above where you want the next series placed.
3. Click the Duplicate button. This will create an exact duplicate of the selected series.
4. Double click on the duplicate series item to bring up the Series dialog box.
5. Change the data range to the next range of data you want charted.
6. Since this is a duplicate, you may want to change the symbol and symbol color (this only applies if the chart contains symbols).
7. Click the OK button.
8. With the duplicate series still selected, choose a new color from the fill color pallet in the tool bar (identified by the paint bucket icon).
9. Repeat steps 2 through 8 for each new series you want to add to the chart.

Claris Resolve: Creating Query Documents

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.

Claris Resolve 1.1 has the capability to read System 7 Query documents via the HostAccess utility script provided with the package (installation optional). It does not, however, create Query documents.

You can create System 7 query documents in several application including Clear Access and DataPrizm. Autorun files created in DataPrizm are also supported and add the ability to access other protocols such as SQLNET.

DataPrism is distributed by Brio @ (415) 961-4110

Claris CAD: Feet and Inches Displayed in Location Bar

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
You can get the Location bar in Claris CAD to display in feet and inches. Several conditions must be met, but these are common among architectural users, who are most likely to want feet and inches. All of the following commands are in the Rulers... dialog.

1) You must have an actual ruler set in feet. (The actual ruler is the bottom ruler in the Rulers dialog. It represents the 'real life' dimensions of the objects you are drawing. The top ruler represents the dimensionson the screen. For more info see the article "The Rulers... Dialog.")
2) You must have Fractional Readout selected.
3) You will get feet and inches more often if you have Round off values.

Round off values rounds off the dimensions in the location bar to display in feet an inches. 3.01 feet will display as 3' with Round off values active.

The denominator in the fractional readout will depend on the number of divisions per inch set in the dialog. If you have 12 divisions per foot, you will get whole inches in the readout; if you have 24 divisions per foot you will get half inches.

It is not possible to have feet and inches to display in the Info window.

Finding and Resolving Init Conflicts

Methods for troubleshooting Extension and other Conflicts with System 6 or 7

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.

Many software problems are caused by conflicts between programs and system software. Conflicts can cause crashing, unexpected or unexplainable behavior or corrupt documents.

There are many types of files that can cause these problems. Extensions (called inits before System 7), Control Panel documents, start up files and scripts are just some of the types. To determine if a problem you are having is being caused by a conflict, follow the directions below.

Step 1) Be sure that the behavior you are encountering is a system problem. Are you sure the program is misbehaving, and that you haven't misunderstood one of it's features? For example, if something is printing incorrectly, check your printouts against what you actually see on the screen. You might have inadvertently changed the something and if the first time you see the change is on a printout, you might assume it's a system problem.

Step 2) Define the problem. Some problems are easy to identify (If I go under the File menu to "Open" it crashes) and some are a little more difficult (If I draw a rectangle and then scroll to the bottom right of the screen, I get a little weird cursor). You need to have something to test to see if you have found the solution to the problem.

The trick for testing for a conflict is to separate the System file from anything that might affect it, then restart. If the problem goes away, then you can be sure it is being caused by something in the system folder, and you can begin the process of searching for it. If it does not solve the problem, then it either is something in the program, or just unexpected behavior.

While there is software that allows you to turn inits off from the Control Panel, they are not as reliable for testing as the methods outlined below. In some cases, the software that turns off the inits has caused the conflict!

METHOD FOR COMPUTERS RUNNING SYSTEM 6 OR EARLIER
In order to separate the system from the inits, you have to place them in separate folders and restart the computer. Here is a step buy step method for testing:

1) Open your system folder. Click on the File menu and select "New Folder." Drag the resultant new folder to the Desktop. You will not need to rename the folder. A handy place to put it is right above the Trash.

2) Move your System file and your Finder file out from the System folder to the new folder. It's important to move them, not copy them.
3) Restart the computer.
4) Try to recreate the problem you were having.

IF YOU FIND AN INIT CONFLICT (System 6)
Let's say you have 10 inits, and you've found that one of them is causing a problem, but you don't know which one. You could put them into your temporary system folder one at a time and restart and then check for the problem, but that would take a long time.

The trick is to put 5 of your inits into the temporary system folder, restart, then check for the conflict. If it is still gone, then you have eliminated those inits as the culprit. You can then put 3 more inits in your temporary system folder and restart and narrow down the possibilities that way. This is what is known as a binary search, and it can dramatically cut down the time it takes to find a problem. Instead of testing 100 files one by one, you could test all 100 files using only 7 searches (50 files, then 25, 12, 6, 3, 2,1).

METHOD FOR COMPUTERS RUNNING SYSTEM 7
System 7 has a very handy method built right in for checking init conflicts. If you restart the computer while holding down the shift key, none of the files that affect the system on startup are enabled. You should hold down the shift key until you see the message that says, "Welcome to Macintosh. Extensions off."

After that, check to see if the conflict has been resolved. If so, do a binary search as described above, if not, do a variation on the method for System 6:

1) Open your system folder. Click on the File menu and select "New Folder." Drag the resultant new folder to the Desktop. You will not need to rename the folder. A handy place to put it is right above the Trash.
2) Move your System file, Finder file and your Enabler out from the System folder to the new folder. It's important to move them, not copy them.

Different computers require different enablers. If you are not sure which one your computer needs, copy all of the enablers to the new folder. The incorrect ones will be ignored.

3) Restart the computer.
4) Try to recreate the problem you were having.

When you are done troubleshooting:
1) Put the System, Finder and Enablers back into the System Folder.
2) Restart the computer.
3) Put the new system folder and its contents in the trash.

IMPORTANT NOTE: Under System 7, if the System file doesn't find all of the folders it expects to in the system folder (Apple Menu Items folder, Control Panels folder, etc.) it creates the folders. It is imperative that when you put your System, Finder and Enabler files back into the original folders that you do not move these new folders. They are empty, and if you drag them to the original system folder and it asks you to replace items with the same names, hit Cancel! If you do copy them, the empty folders will replace the folders with items in them, and you could lose all of your extensions, control panels, etc.

To make it easy to remember, only move back the items you removed from the original system folder.

IF YOU FIND AN INIT CONFLICT (System 7)

If you find an init conflict under System 7, you could use the method given above for finding conflicts under System 6. This is especially useful since there are instances when holding down the shift key does not always keep the problem file from affecting the system.

SOLUTIONS
Unfortunately, you do not have many options if you do find a conflict. You should contact the publishers of the software and make certain that you have the latest versions, and to see if those companies have any suggestions. Using the Extensions Manager or Control Panels to turn problem software on and off temporarily may allow you to use conflict software packages one at a time.

Microsoft Word 5.0: EPSF Printing Problem

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
The following customer-reported issue was duplicated by Claris Technical Support: A Microsoft Word 5.0 document containing an EPSF image from MacDraw Pro would not print. Instead, the following error message results: "limitcheck error: offending command exec." Similar EPSF files from other applications also would not print.

The solution was to restart the laser printer. The documents would then print correctly.

ClaisWorks: Out of Memory or Disk Space Message

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
When downloading files from an online service, an "Out of Memory" or "Not Enough Disk Space" message may appear. If you have enough memory and disk space, the issue is most likely that the file header, which contains information about the file size, is being read incorrectly by the File Transfer Tool.

This issue is particularly prevelant among GIF (Graphic Interchange Format) files, which were probably uploaded originally by CompuServe Navigator version 3, and have a corrupt MacBinary header.

The solution is to use a method other than MacBinary. If you are using the XModem Tool, try MacTerminal. If the file is a text file or you know that it contains only a data fork (this is true of ClarisWorks documents, not true of applications or extensions), Straight XModem will also work. Use XModem Text if you are downloading a text file that was created on a computer other than the Macintosh (with the exception of Claris Windows products). The Kermit Tool which comes with ClarisWorks 2.0 is another recourse.

The XModem 1.1 tool which ships with ClarisWorks 2.0 is more robust in its error checking of MacBinary headers and will greatly reduce this issue.

Claris CAD: Radius Pivot Monitor Issue

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.

When running Claris CAD or MacDraw II (any version) on a computer with a Radius Pivot monitor, pivoting the monitor while the application is running can cause garbage to appear on the monitor. If you change the orientation before launching MacDraw II or Claris-CAD, the screen will appear correctly. This is because the off-screen buffer is set up based on the screen size upon launch.

This does not affect MacDraw Pro, because the off-screen buffer is set to the window size, not the screen.

Claris CAD: 7 Document Limit when Printing from Finder

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.

Claris CAD has a 7 document limit when printing from the Finder. Normally, you can select the documents you want and choose "Print" from the Finder's File menu. Claris CAD, however, presents the message that the Finder can only print 7 documents at a time.

This is not a limitation in the current version of the Finder and most applications do not limit you to 7 documents including MacWrite II and ClarisWorks. This appears to be a remnant from an earlier version of the operating system.

Claris CAD: The Rulers... Dialog

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
The object of the Rulers... dialog is to allow you to draw objects in a scale on the screen that represents the size of the drawn objects in real life. If you have a machine part that is one foot high in real life and you wish to draw it one inch tall on the screen, you would set your scale in the Rulers... dialog to 1" = 1'.

The top ruler in the Ruler... dialog represents the size of the object on the screen. The bottom ruler represents the size of the object in real life. This is the 'actual' ruler.

Notice that you can set a scale in miles on the actual ruler. It would take a pretty darn big monitor to show that on screen!

The divisions per (actual ruler unit) has two purposes. First, it regulates the number of grid points per (drawing ruler unit) on the screen. The other is influencing the read out of the Location bar.

If you wish to have feet and inches, you need to check Fractional Read out and Roundoff values (see the record "Feet and inches displayed in Location bar).

If you check Zero point locked then you will not be able to move the zero point of the drawing while that ruler is active.

If you deselect Show unit name then the unit name or symbol will not display in the Location bar.

MacWrite II: Microsoft Word PC Cannot Read Files

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
ISSUE: When trying to open a document saved out of MacWrite II as a Microsoft Word PC file, the Microsoft Word PC application on the PC cannot read the file.

SOLUTION: Give the file name a ".DOC" suffix when you save the file or change it on the desktop.

EXAMPLE: XXXXXXXX. DOC

The text before the suffix is limited to 8 characters in length.

EXPLANATION: Microsoft Word PC only recognizes files that end in .DOC

NOTE: WordPerfect PC files do not require this type of suffix.

Claris Resolve: How to "Clean Up" Imported Data

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.

Sometimes you import data into Claris Resolve that contains currency symbols within numbers. When a number contains a dollar sign, comma, parenthesis, or (in some cases) the percentage symbol, Claris Resolve will interpret it as a text label, and not a value. Examples of such values include:

$100
1,000
(50)

The Value() function will not be of much help converting these expressions into numbers. It will either return a 0, or only the part of the number that falls before the comma (or other non-numeric character).

If you import these kinds of values often, the script below will make the task much easier. Once you attach it to a button, you help Claris Resolve interpret the imported data. Just select the data and click the button. Claris Resolve will process the selected fields and distill numeric values. This particular script will process discontiguous selections, and will preserve labels and blank cells. But be careful not to "select all" and activate the script; it will process blank cells in your document, and that would take a very long time.

```
{-------------------------------------------------------}
{ declare variables }
DEFINE X,RR,THEROW,THECOL,CV
{ we're going to allow for discontiginous selections.}
X = 1
{ stop redrawing the screen }
INVALIDATE ON
{ make sure we're working on a valid range }
WHILE ISREF(RANGE(REFERENCE(SELECTION(X))))
{ what's the currently selected cell range? }
RR = REFERENCE(SELECTION(X))
{ cycle through cells in the selected range }
FOR THEROW = ROWOF(RANGE(RR)) TO ROWOF(RANGE(RR)) + ROWS(RANGE(RR)) - 1
FOR THECOL = COLOF(RANGE(RR)) TO COLOF(RANGE(RR)) + COLUMNS(RANGE(RR)) - 1
CV = INDIRECT(MAKECELL(THECOL,THEROW))
{ if it's already a number, we don't need to work on it }
IF ISTEXT(CV)
{ replace common elements of formatted numbers }
CV = IF(FIND("$",CV,1),REPLACE(CV,FIND("$",CV,1),1,""),CV)
WHILE FIND(",",CV,1)
CV = IF(FIND(",",CV,1),REPLACE(CV,FIND(",",CV,1),1,""),CV)
END WHILE
CV = IF(FIND("(",CV,1),REPLACE(CV,FIND("(",CV,1),1,"-"),CV)
CV = IF(FIND(")",CV,1),REPLACE(CV,FIND(")",CV,1),1,""),CV)
{ tricky way of discerning between text and numbers. }
CV = IF(VALUE("2"&(IF(LEFT(CV,1)="-",RIGHT(CV,LEN(CV)-1),CV))&"1")=2,CV,VALUE(CV))
PUT CV INTO MAKECELL(THECOL,THEROW)
END IF
END FOR
END FOR
X = X + 1
END WHILE
INVALIDATE OFF
```

ClarisWorks: Letter Grades from Test Scores

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.

With the advent of many teachers using the ClarisWorks spreadsheet environment to calculate letter grades, there's a need for a calculation to handle this situation. The basic problem is that I have a number in a cell less than or equal to 100 and I'd like to calculate a letter grade in another cell based on this number. The ranges are easy to change and the ones used in this formula are:

90 to 100 is an "A"
80 to 89 is a "B"
70 to 79 is a "C"
60 to 69 is a "D"
0 to 59 is an "F"

Here is the actual calculation which is indented & put on separate lines only for ease of reading:

```
= IF(A6>=90,"A" ,
IF(AND(A6>=80,A6<90),"B" ,
IF(AND(A6>=70,A6<80),"C" ,
IF(AND(A6>=60,A6<70),"D","F" ))))
```

So if there are numbers in column A, for example, type the formula above into cell B1 & copy & paste it into the remaining cells in column B.

Another solution is to use the Lookup or VLookup function. These functions are explained in the ClarisWorks Handbook.

Claris Resolve: Incompatibility with NoFontScaling INIT

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
There may be an incompatibility between Claris Resolve 1.1 and the NoFontScaling INIT (shareware).

Setup: System 7.0, Geneva bitmaps installed, Geneva TrueType not installed

Problem: When printing or previewing a spreadsheet, the numbers in cells would display in scientific notation or as "#######", even for numbers entered to only one decimal place. Switching to another font, or removing the INIT solves the problem.

MacDraw Pro: Bold Text Appears Plain on Screen

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
When using TrueType fonts, bold text may appear non-bold at 10 pt. size or below. Similar text may appear bold in other programs.

Unlike most other applications, MacDraw Pro gives priority to using the TrueType font over the bitmap font for screen display. TrueType does not render bold text on screen at 10 pt. or less with current system software (7.1/Tuneup 1.1.1).

If you magnify the document view to, say, 200%, so that 10 pt. bold text is displayed at 20 pts.., it will, of course, appear bold on screen.
Currently, the only way to make MacDraw Pro display bold text correctly below 11 pt. is to remove that TrueType font from the system.

Other programs will display TrueType fonts similar to MacDraw if the bitmap is removed from the System. This will force the program to use the TrueType bold font, rather than rendering a bold font from the plain bitmap.

MacDraw/MacWrite: Bottom of Text Characters Cropped

Non-Postscript Printers: Solution to Printing Large Characters

I'm having difficulty writing large characters on a Personal LaserWriter SC. Printed characters larger than 18 point are being cut off near the bottom. For example, if an "f" is printed, most of the part below the crossbar is missing.

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
The Personal LaserWriter SC exhibits the same symptom as the LaserWriter IISC and the ImageWriter LQ: when printing outline, bold and shadow text in 18 point or larger type sizes, some parts of the characters may be omitted and/or garbled. This issue usually occurs when 4X fonts are used. Installing more system RAM and/or allocating more memory to the application will have no effect.

In March of 1991, this issue is fixed by using TrueType-compatible printer drivers. Apple introduced the TrueType font scaling software which is bundled with both the StyleWriter and the Personal LaserWriter LS printers. The TrueType compatible drivers are available on a Macintosh Printing Tools disk which contains the drivers for the following printers:

Printer	Version
LaserWriter	6.1
ImageWriter	6.1
AppleTalk ImageWriter	6.1
Personal LaserWriter SC	6.1
Personal LaserWriter LS	1.0
ImageWriter LQ ImageWriter	6.1
ImageWriter LQ AppleTalk ImageWriter	6.1
StyleWriter	1.0

In May of 1991 another solution was made avaliable with the release of System 7. System 7 includes a new Printing disk and Tidbit disk which contain printer drivers for the following:

Printer	Version
LaserWriter	7.0
Personal LaserWriter SC	7.0
ImageWriter	7.0
AppleTalk ImageWriter	7.0
LQ ImageWriter	7.0
LQ AppleTalk ImageWriter	7.0

MacDraw Pro: QuickDraw Printers Faster with System 7 Tuneup

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.

When printing Truetype fonts from MacDraw Pro 1.5 with System 7, the System 7 Tuneup will significantly increase printing speed. This is especially true with QuickDraw printers (ImageWriter, Personal LaserWriter LS, LaserWriter SC, Deskwriter, etc.).

Published Date: Feb 18, 2012

MacDraw: Rotated Objects use More RAM

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
Rotated objects in an open document use more RAM than non-rotated objects. This is especially noticeable when bitmaps or pixmaps are rotated, as these objects use much more RAM than native MacDraw II/Pro objects.

MacDraw stores two images of rotated objects in RAM: a rotated and non-rotated copy of the object. This is done to improve the print quality of rotated objects when printing to print drivers that have their own rotation commands.

When printing to a print driver with built-in rotation, such as the LaserWriter, MacDraw sends a non-rotated version of the rotated object and lets the print driver rotate the object at its maximum resolution. When printing to a print driver without built-in rotation (i.e., ImageWriter), MacDraw sends the rotated bitmap based on 72dpi.

MacDraw Pro 1.5: Read Me File

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
Welcome. This addendum is provided to communicate information and work-arounds not available in printed documentation. You can also find important tips in the MacDraw Pro User's Guide Troubleshooting section (Appendix A).

INSTALLATION NOTES
Please remember to remove all virus checking software from your system before installing MacDraw Pro software, and then to re-install your virus checking software afterward.

The installation process will leave some temporary files on your hard disk. These files are automatically removed by your Macintosh when you restart (if you need to recover disk space after installation, Restart your Macintosh).

QuickTime EXTENSION
Apple's QuickTime extension is needed if you wish to use QuickTime movies with MacDraw Pro. Contact Apple at 800-947-5176 for information on how to get a copy of the "QuickTime System Extension ". Apple also has available a "QuickTime Starter Kit" which contains more than just the system extension. For information on the starter kit contact Apple Customer Relations at 800-766-2333.

SLIDE SHOW STATIONERY FILES
Included in the Slide Show Stationery folder, located within the Sample Files folder, are four stationery files. These files have drawing sizes that correspond to standard monitor sizes. If desired, these files may be used so that the content of a slide presentation is not scaled when Slide Show is turned on. Objects will appear as they do at a 100% zoom level and QuickTime movies will play with optimum performance.

If you need to generate a drawing size for a monitor size that was not provided or you are experiencing some scaling effects for your particular monitor, look up the picture dimensions in the reference manual that came with your monitor. Use these dimensions to set the width and height items in MacDraw Pro Drawing size dialog box.

A/UX 3.0 PUBLISHING
Due to certain anomalies, MacDraw Pro requires that an unsaved document must be saved before Publishing any information when running under A/UX 3.0. The Create Publisher menu item in the Publishing menu will be gray until the document is saved.

PRINTING TWO COLOR PATTERNS
MacDraw Pro 1.5 has included the ability to define and use patterns that have foreground and background colors. These patterns print correctly to full color QuickDraw printers. Due to current postscript driver limitations, these patterns will not print correctly when directly printing using the current Apple LaserWriter drivers. However, the EPSF file filter, included with MacDraw Pro, generates the necessary information to print these two-color patterns. If you need to print two-color patterns to a postscript printer, first save the file as an EPSF file. Place the saved file in a new document and print. The two-color patterns will print correctly.

FONT SUBSTITUTION
MacDraw Pro uses processes to place text as accurately as possible when printing. These processes are not compatible with Font Substitution in the LaserWriter Driver.

To ensure proper printing of high-resolution fonts, please use Helvetica, Times, and Courier instead of Geneva, New York, and Monaco.

MACDRAW II IMPORT
Improved text placement in MacDraw Pro may cause line breaks to change slightly within text blocks in imported MacDraw II files. This is due to letter spacing contracting (or in some cases expanding) slightly. Manually adjusting the letter spacing of words on a line above a new line break will return the line break to its original position.

To increase (decrease) character spacing for a word:
1. Select the text tool, and click on the text block.
2. Double-click the word to select it.
3. Hold down the option key and press the right (left) arrow key.

StyleWriter INFORMATION
The Apple StyleWriter printer uses the memory in your Macintosh to rotate blocks of text. Depending on available memory, large blocks of rotated text may not print. Try the following steps:
1. Break the text block into smaller parts, and delete extra carriage returns. The total amount of memory required to print rotated text varies in direct proportion to the total size of the text block, so smaller blocks need less memory.
2. Increase available memory. Instructions on increasing available memory may be found in Appendix A of the MacDraw Pro User's Guide.

ADOBE TYPE REUNION INFORMATION
Adobe Type Reunion substantially reduces the performance of MacDraw Pro for many interactive operations (such as selecting objects). You may

experience significant performance gains by removing Type Reunion from your system folder and restarting your system before using MacDraw Pro. Additionally, an incompatibility exists with Type Reunion when saving files in MacDraw II format which can result in system instability. Please do not Save As MacDraw II with Type Reunion installed.

COMPLEX POLYGON OBJECTS

Complex polygon, bezigon, and freehand objects may not print in some cases. Please see the User's Guide Troubleshooting section for information on approximate point guidelines, and tips on printing. Additionally, gradient fills may not appear in complex polygon objects.

Simplifying complex polygons will result in faster printing and faster screen display. To simplify these objects, use the Reshape command, select the object, and remove some points. Also, try to reduce points of overlap on an object (where lines on the object cross).

MacDraw II: Screen Redrawing Very Slowly

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.

If screen redraw is very slow (zooming, scrolling, changing views), check the Monitor cDev settings to see if it's set for "Colors/Black&White". To fix the problem, click on the "Grays" radio button.

Some video boards can be very slow when set to "Colors/Black&White", which can cause MacDraw II and MacDraw Pro to redraw on the screen very slowly.

Published Date: Feb 18, 2012

MacDraw Pro v1.5: Slow Screen Redraw when Spell Checking

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
Under certain conditions, screen redraw may be very slow when spell checking in MacDraw Pro 1.5. This can happen when the offscreen buffer is disabled ("Draw directly to screen" option in Preferences is ON). The solution is to turn this option off.

Note: MacDraw Pro 1.5 may disable the offscreen buffer automatically if it needs the RAM to function. This is noted in "About MacDraw Pro": Info.

In this case, making more RAM available to the document will automatically turn the offscreen buffer back on.
Published Date: Feb 18, 2012

MacDraw Pro: Small Caps Text Displays & Prints Incorrectly

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.

Under certain conditions, text with Small Caps style will display and print incorrectly. The text will appear slid about one inch to the right within the text block. Thus, the left side of the text block will appear blank, while the text will appear truncated on the right. Changing any of these conditions will work around the issue:

MacDraw Pro 1.5:
1 -32-bit addressing must be turned OFF to fix this issue

MacDraw Pro 1.0:
1 - The font must be a non-TrueType font
2 - The first character of the text block must be Small Caps style, and must not be a space character
3 - The text must be left-aligned
4 - The text block must be caption text (no right margin), not paragraph text
5 - 32-bit addressing must be on.

ClarisWorks: Using Macros to Simulate Custom Text Styles

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
If you use MacWrite II, you know how handy it is to set a custom style for the text formats you apply to headings and other sections of your document. Although ClarisWorks doesn't have a "Custom Styles" option per se, you can set up those styles easily with a macro. Here's what you do:

1. Highlight text that you want to format.
2. Choose "Record Macro" from the Macro item in the File menu. (Or press Command-Shift-J).
3. Pick a key equivalent for the custom style and click Record.
4. Apply the font, size, style, and color options you want.
5. Choose Stop Recording from the Macro item in the File menu. (Or just press Command-Shift-J again.)

From then on, whenever you want to apply that style in your document you just highlight the text and press the key equivalent you selected.

Claris CAD: X‘s Show Up in AutoCAD Document When Opening a DXF File

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
When a Claris CAD file containing dimensions is translated to DXF, then opened in AutoCAD, small X's show up in unexpected places. The X's are points that are associated with the dimensions in Claris CAD. These points are not displayed in Claris CAD but do exist and therefore they are translated through DXF.

We need to translate these points because we do not know if they are from a dimension or if they were created by the user. We set AutoCAD's points display mode to "ON" in our attempt to display everything that is translated. The AutoCAD user can turn off points display by changing "PDMODE" to 0. Use the following commands to do this:

SETVAR<return>
PDMODE<return> (PDMODE should be set to 3)
0 <return>

You must then force a redraw for the file to update with the X's hidden. The redraw command will not accomplish this task. The easiest way to do this is to Zoom In then back out again.

Claris CAD: Making an Arc or Circle Tangent to 2 Lines

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.

To make an arc which is tangent to 2 existing lines:

1. Select the Chamfer tool
2. Select 2-point drawing method (Use the 3-point tool if there are many lines near the two intended tangents)
3. Uncheck TRIM in the Location Bar
4. Type a Radius measurement into the Location Bar.

If you do not know the appropriate Radius -

a) Draw a line connecting the two original lines starting at about the location where you want the arc or circle to be tangent
b) SHOW INFO for the connecting line, then Select and copy the length dimension
c) Delete the measuring line
d) Paste the dimension into the RADIUS box in the Location Bar
e) Divide the length by 2 to get a radius. (Type "/2" after the dimension pasted into the RADIUS)

5. Click on the first line, drag to the second line and release

To make a circle which is tangent to 2 lines: Do steps 1 to 5 above

6. Select the circle tool
7. Select the center point modifier
8. Move the cursor over the tangent arc until the circle center point appears
9. Click and drag until the circle appears, then drag back to the arc until the tangent indicator appears
10. Release the mouse
11. Click on the circle and choose MOVE TO BACK from the ARRANGE menu
12. Click on the arc and hit DELETE

MacDraw Pro v1.5: SlideShow Stack Issue

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
In the SlideShow HyperCard stack included with MacDraw Pro 1.5, clicking on the Start Slide Show button may result in an error message and/or crash if there is no document open on the target computer (the computer that is to run the slide show).

The correct procedure is to make sure that there is a slide show document open before attempting to start a slide show.

MacDraw II: Missing Arrows when Pasted into Another Program

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.

In MacDraw II 1.1v2, showing the clipboard while lines with arrows have been cut or copied shows the lines without arrows. Subsequent pasting into MS Word pastes them without arrows, yet if MacDraw's clipboard is not shown after cutting or copying, the arrows paste okay. While the arrows do not show in the MacDraw clipboard, they do show in the Finder's clipboard.

MacDraw Pro: Freezes when Opening Translated Files

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
If MacDraw Pro locks up / freezes when opening / converting files using the XTND translators (MacDraw II, MacWrite II, TIFF, EPSF, etc.), try the following:

1 - Select the Translators icon in Preferences, then click on the Update XTND List button.

2- Quit the application, then delete the XTND Translator List file (System 6: in the Claris folder; System 7: in the Preferences folder).

3 - If the problem persists, rebuild the desktop (hold down the command and option keys while restarting the computer), then run Disk First Aid or Norton Disk Doctor. Disk First Aid is included on your System disks. Instructions are included in your computer's owners manual.

Display Cards 4■8, 8■24, 8■24 GC: Monitor Video Cables (2/94)

What are the part numbers of the cables used to connect the new Display Cards 4*8, 8*24, and 8*24 GC to these monitors:

- High-Resolution Monochrome Monitor

- AppleColor High-Resolution RGB Monitor

- Portrait Display

- Two-Page Monochrome Monitor

This article has been archived and is no longer updated by Apple.
The proper cable to use with the High-Resolution Monochrome Monitor and the AppleColor High-Resolution RGB Monitor is Apple Part #590-0161 (DB-15 to DB-15).

To connect the Portrait Display or Two-Page Monochrome Monitor to any of the new Display Cards or to the Macintosh IIci built-in video connector, use cable Apple Part #590-0615 (DB-15 to 13-pin mixed-contact D-connector).

ClarisWorks: Searching for a Range of Names with Match Records

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
If you would like to find a range of names, based on the first letter of the last name, here are some methods.

Given that your database has a text field named "Last Name", the following Match Records formulas will find the last names from A thru C. The Match records command is in the Organize menu.

OR(LEFT('Last name',1)="A",LEFT('Last name',1)="B",LEFT('Last name',1)="C")

or you can use:

AND(LEFT('Last name',1)>="A",LEFT('Last name',1)<="C")

The LEFT function is taking the first character of the 'Last name' field for comparison purposes.

Hints:
Notice that fields are surrounded by a single quote (ie 'Last name') and that text for comparison is surrounded by double quotes (ie "A").

If you are using ClarisWorks 1.0, once you click OK in Match Records dialog box, you lose the formula. (Version 2.0 of ClarisWorks will retain the formula when you reenter Match Records). You may want to select the formula first and copy it to the clipboard. Searches you do on a routine basis could be pasted into your scrapbook.

If you are doing the search for mail merge purposes, note the following:
- After you've clicked OK and selected the appropriate records, be sure to choose Hide Unselected from the Organize menu or your mail merge document will print a letter for the unselected records as well.

ClarisWorks: Blank Fields or Cells and Average/Count Functions

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
There are several situations where the AVERAGE and COUNT functions will count blank values as 0, thus returning an incorrect value.

In ClarisWorks Spreadsheet or ClarisImpact Table:
1. Individual cell references are used instead of cell ranges.
2. If the cell values are the result of an IF function which returns a blank value. The only known solution is to use the Find or Match Records feature of the database to meet the criteria you were trying to meet with the IF function.

In the database:
3. In calculation and summary fields.

For example, given:

Cell or Field Value
A1 2
A2 blank
A3 4

Spreadsheet or Table formula = AVERAGE(A1ÉA3) = 3 Correct: (2+4)/2=3
Spreadsheet or Table formula or Database Calculation = AVERAGE(A1,A2,A3) = 2 Incorrect: (2+4)/3=2

Solution one:
In a database, the Summary field returns values for the records you are currently viewing. So you can use the following method to discount blank values:

1. Choose Match Records from the Organize menu.
2. Type this formula: ISBLANK ('Field you're averaging').
3. Click the OK button.
4. Choose Hide Selected from the Organize menu.

Now the only records in the found set are ones that have data in the field you need to average. Since Summary fields only total records that are in the found set, all blank fields will be excluded from the average.

Solution two:

When it is not possible to AVERAGE a cell range (which returns the correct AVERAGE), the following formulas will create the correct divisor using the COUNT function, even without isolating the records with blank values:

Spreadsheet or Table = SUM(A1,A2,A3)/COUNT(A1,A2,A3)

Database Calculation field (which should be used to calculate the average of two or more number fields on a per record basis):
Average (Calculation, Number result) =SUM('num1','num2','num3')/COUNT('num1','num2','num3')

Database Summary field (which should be used to calculate the average of a single number field across a range of records):
Average (Summary, Number result) = SUM('num1')/COUNT('num1')

Note: A Summary field must be placed in a Leading or Trailing Grand Summary Part, or in a Sub-Summary when Sorted by (Some Field) Part on the Layout. Additionally, you must sort (if the field is in a Sub-Summary Part) and select View menu, Page View (or print) to see the results of a Summary field.

Claris Resolve: Database Won‘t Find Numbers with Alpha Characters

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.

Figure 6-14 on page 6-19 of the Claris Resolve User's Guide shows a database that will find on numeric entries. The example shows entries of 18 mm, 30 mm, etc.

The database find command will not find the examples as shown in the book unless you delete "mm" from the entries.

However, for other files this might not always be the case. The numbers in column "C" could have a Custom Format.

To illustrate, select a small range of cells and fill with numbers (Cmd-L). Choose Format > Numeric > Custom Format, type #" mm" into the dialog box and click OK. The numbers will be formatted like you see on page 6-19, and you will be able to find them as shown in the example.

Claris Resolve: External Cell and Range References

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
Claris Resolve has the ability to reference cells and ranges in another open worksheet. These references are not hot linked (They do not update automatically. See Below for updating info.).

To enter a reference, start the reference with the name of the worksheet and a colon.

Examples:

= B3 + Worksheet2:B9

This will add the contents of cells B3 through B9 from the worksheet "Worksheet2"
If the worksheet has a name with a space in it, you must enclose the ENTIRE reference with single quotations.

='Home Budget:C6'

To use a range reference, you must be using a formula that requires a range. All other external references reference a single cell. If you need to refer to a range without using a function, enter the range's first cell as the reference, select a range in your worksheet the same size as the external range and choose Fill Down and Fill Right. Claris Resolve will paste the values of the external range into the worksheet.

One note: If external data changes, you MUST choose Calculate Now to update your worksheet.

ClarisWorks: Freehand Tool Smoothing

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.

Objects created using the freehand graphic tool in ClarisWorks 1.0 are automatically smoothed. There is no way to bypass the smoothing when creating the object. When Unsmooth is selected, the object will not return exactly to its original unsmoothed shape. If you need more control over a freehand object's shape, try using the Reshape command.

ClarisWorks 2.0 allows you to toggle smoothing on and off through a checkbox in the Preferences dialog box.

ClarisWorks: Importing DOS spreadsheets

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.

Lotus 1-2-3

Lotus 1-2-3 for DOS only supports the formats WKS (release 1a), WK1 (release 2.0), and WK3, none of which ClarisWorks for Macintosh supports (the Windows version does support them). In addition, 1-2-3's "Translate" utility doesn't support any formats that ClarisWorks supports, except for DIF, which doesn't preserve formulas. Furthermore, Lotus 1-2-3's idea of creating a text file is printing to a file that uses spaces between cells to simulate columns -- not too useful as far as ClarisWorks is concerned. The best situation is either:

- Use Claris Resolve, which can open WKS or WK1 files, and export as SYLK.
- Use Lotus 1-2-3 for the Mac.
- Use any other Mac spreadsheet which can open Lotus 1-2-3 files

Another solution is to use Excel for DOS or Windows. Both can read WK1 files. So if a customer wants to convert a PC Lotus 1-2-3 file to ClarisWorks, and they have Excel on the PC, they should:

- Convert their file to a WK1 file using Lotus' "Translate" utility or by changing the file name to *.WK1 on the command line when they save the file
- Open the file in Excel
- Save it as SYLK
- Take the file over to the Mac using Apple File Exchange (specifying text translation!)
- Open it in ClarisWorks

ClarisWorks is more particular about SYLK files than is Claris Resolve. While you can export a SYLK file from Excel for DOS or Windows, take it through Apple File Exchange, and open it directly in Resolve, the ClarisWorks SYLK translator isn't as robust. You must remember to select "Text Translation" in Apple File Exchange. Then ClarisWorks will be able to open the SYLK file. Otherwise you'll get a dialog box saying there were "errors" translating the file, and you will probably end up with an empty spreadsheet.

ClarisWorks: Open/Save Dialog Does Not Update

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
There is an incompatibility between Directory Assistance II 2.0, included with Symantec's Norton Utilities for the Macintosh, and ClarisWorks.

If you choose Open and click Import, when you change the radio buttons from ClarisWorks to another choice (such as Word Processor, Spreadsheet, Graphics, etc.) the window will not update to show the appropriate files available for opening.

You can force ClarisWorks to redraw the list by backing out of the folder you are in and then reentering it.

Another solution is to disable Directory Assistance. To do this, select "Directory Assistance Settings..." from the "diamond" menu in the upper left hand corner of the Open/Save dialog. Click on the turned up page corner to go to the second page of preferences and check "Bypass Directory Assistance." Directory Assistance will be disabled whenever you use ClarisWorks.

Think C: Troubleshooting Bus Errors

I'm programming with Think C on a Macintosh IIci. When I try to run a Menu Management program, I get a bus error.

The source debugger that comes with Think C says that it's running into a bus error at address 0x81BBAE. A bus error implies a hardware problem, since it's trying to access memory that it doesn't have, and it is not wrapping around to pick up the unused memory. The program seems to be initializing the windows OK but crashes just before it creates the menu bar.

Can you help?

This article has been archived and is no longer updated by Apple.
Actually, a bus error does not mean that you are having a hardware problem.

One of the most common causes of a bus error is a word or long word instruction being executed on an odd address. Another common cause is a program accessing an address in the range of addresses belonging to NuBus. Usually, the slot owning this address will not have a card in it.

Check the calls being made to the Menu Manager -- if you suspect these calls. Specifically, passing an invalid handle to one of the calls could definitely cause this error.

Try stepping through the code using the debugger and the variable watcher. Find the exact point where the error occurs and work your way back until you find the culprit.

ClarisWorks: Printing Color Bit-maps to the ImageWriter

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
ClarisWorks prints color bitmaps to an ImageWriter in black and white when using Apple's ImageWriter driver. This could happen when inserting a color bitmap into the graphics environment of ClarisWorks 1.0 or when creating bit-map art from scratch with the ClarisWorks 2.0 (or 3.0) painting tools.

NOTE: Color bit-maps print out fine to other color printers, including color DeskWriters.

Solution for ImageWriter Owners:
Printing to an ImageWriter using the MacPalette II driver by MicroSpot will allow ClarisWorks to print color bitmaps in color. The driver supports dithering, so the print quality is pretty good for an ImageWriter.

MacPalette II requires a Mac with color ROMs (not the Mac Classic), and is much cheaper than buying a better color printer.

This product is not officially tested by Claris, but initial printouts indicate no problems.

MicroSpot
Suite 6
12380 Saratoga-Sunnyvale Road
Saratoga, CA 95070

(800) 622-7568 Sales
(408) 253-2000 voice
(408) 253-2055 fax
(408) 257-4000 Technical Support

NOTE: The drawing module in ClarisWorks can print up to 8 colors with the ImageWriter driver but will be enhanced by adding MacPalette. Mac Palette can approximate up to 250,000 colors using dithering.

ClarisWorks: Printing Text and Graphics Separately

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
There is no specific feature which will allow you to print text and graphics separately from ClarisWorks.

However, this can be done for a word processing document which has graphics only on the graphic layer (not pasted in-line with text). You can cut the graphics, print the text, and then paste the graphics, cut the text, and print the graphics. To do this:

First, save your document!

1) Click the arrow tool.
2) Choose Select All from the Edit menu (this selects all graphic objects).
3) Cut
4) Print the text.
5) With the arrow tool still selected, Paste.
6) Click in your word processing text and then choose Select All and Cut.
7) Print the graphics.

Close the file and don't save changes.

ClarisWorks: Viewing Databases in "Spreadsheet" mode

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
The Microsoft Works database module has a "Spreadsheet View" which allows the user to view all data in columns and rows with grid lines.

ClarisWorks database offers similar functionality with its columnar layout. However, if the user has more fields than can reasonably fit across one page (usually greater than 12 on a letter size page), not all fields can be viewed.

If a spreadsheet view is important for viewing and manipulating data, the ClarisWorks user can create a new standard layout (to include all fields), select all the records (using Select All from the Edit menu), and then copy them to the clipboard (choose Copy from the Edit menu). Then open a new spreadsheet document and paste in the data from the clipboard.

If any changes are made to the data, be sure to copy all the spreadsheet cells, delete all records in the database, and paste the new data back into the database.

ClarisWorks: Split Window Pane Anomaly

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
The following is a known bug with the split window pane feature in the spreadsheet environment.

1. Open a ClarisWorks Spreadsheet.
2. Use the horizontal split pane tool to divide the window.
3. Scroll the second half down to a lower part of the spreadsheet.
4. Type a value in a cell in the lower half, column A and hit the ENTER key
5. Close the spreadsheet, leaving the cell selected.
6. Open the spreadsheet (the cell in the lower half should still be selected)
7. Tab to the next cell in the column

The top half of the spreadsheet will unexpectedly scroll to the area of the lower half.

This seems to happen on any machine and has been reproduced with versions of ClarisWorks up to and including 2.0v1.

MacDraw Pro: Scaled Text Reverts in Updated Subscriber

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
Text in a scaled / resized subscriber will not retain its scaled size when the subscriber is updated. The text will revert to the size of the text in the publisher.

To reproduce the problem:
1- In MacDraw Pro 1.5, type "This is a test" in 36 point Helvetica
2- Draw a rectangle around the text and choose Send to Back from the Arrange menu.
3- Publish the two objects
4- Within the same file, Subscribe to the Edition file. Verify that Keep Size Changes is checked for this Subscriber.
5- Scale the Subscriber 50%, or resize it manually
6- Save

When the Subscriber is updated, the rectangle will stay the correct size, but the text will revert to 36 point.

ClarisWorks: Rounding Issues

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.

ClarisWorks relies on Apple's SANE code for rounding and other math functions. SANE uses banker's rounding which rounds to the even integer. In a ClarisWorks spreadsheet, if you format column B as a fixed number with 0 decimal places and type in the values in column A below, the values in column B will be displayed.

A	B
.5	0
1.5	2
2.5	2
3.5	4

As you can see, Banker's rounding results in alternating between rounding down, then up, then down, then up. This actually results in more even rounding accuracy. However, it is not what most people expect. To always round up from .5, use the ROUND function in ClarisWorks.

MacDraw Pro: Command Option Spacebar doesn‘t Show / Hide the Tool Bar

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.

In the US version of MacDraw Pro 1.0/1.5, command-option-space shows / hides the tool bar. This works correctly with System 6. However, with System 7, command-option-spacec is used to switch keyboard layouts. Thus, when running MacDraw Pro on a computer with System 7 and multiple key layouts, command-option-space activates the Keyboard cDev instead of showing/hiding the tool bar.

In MacDraw Pro 1.5v2, a second keyboard command (command-option-tab) has been added to show / hide the toolbar. Use this keyboard command with System 7.

Non-US versions of MacDraw Pro do NOT use command-option spacebar to show/hide the tool bar, in order to avoid this conflict. Non-British international versions use various keyboard shortcuts other than command-option-spacebar. The British version has no shortcut at all to show/hide the tool bar.

This is fixed in MacDraw Pro 1.5v2

MacDraw Pro: Gradients Printing Lower Quality on Legal Size

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
Gradients may print lower quality from MacDraw Pro (any version) to a LaserWriter IIf or IIg printer when printing to legal size (or any paper size larger than letter size).

The reason is that the printer may not have enough RAM available to print the larger paper size with PhotoGrade enabled. When this happens, the printer will automatically disable PhotoGrade in order to print the document. Since PhotoGrade is used to print gradients from MacDraw Pro, the gradients will look poorer when PhotoGrade is disabled (about the quality of a gradient printed from an NT or NTX).

A IIf or IIg needs at least 8MB of RAM to print to legal size using PhotoGrade. Even more RAM may be needed if downloadable fonts are stored in RAM. The LaserWriter IIg only ships with 5MB RAM, which is not enough to print to legal size using PhotoGrade.
Published Date: Feb 18, 2012

LaserWriter IIf and IIg: Frequencies and Screen Angles

What is the line screen number (lines per inch) for the LaserWriter IIf and LaserWriter IIg? It was 53 on an LaserWriter IINTX

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.
With PhotoGrade off, the LaserWriter IIf and LaserWriter IIg are just like the LaserWriter IINTX:
Frequency: 53 lpi
Screen Angle: 45 degrees

With PhotoGrade on, there are five settings available via the LaserWriter Utility. Here are the numbers:

```
Far right:      Frequency: 150 lpi; Screen Angle:  0 degrees
Middle right:   Frequency: 106 lpi; Screen Angle: 45 degrees
Center:         Frequency:  83 lpi; Screen Angle: 56 degrees
Middle left:    Frequency:  75 lpi; Screen Angle:  0 degrees
Far Left:       Frequency:  53 lpi; Screen Angle: 45 degrees
```

Note: The "Middle right" setting is the default PhotoGrade setting.

LaserWriter IIf & IIg: Adobe Changed How Helvetica Fonts Print

We recently purchased some Apple LaserWriter IIf and IIg printers. We also have several LaserWriter IINTX printers. Our designers have reported that the type style of documents printed with the Helvetica font to a LaserWriter IIf or IIg are different from those printed to a LaserWriter IINTX. The difference is most noticeable with characters like "g" and "o" -- one printer prints circular characters, and the other prints oval characters.

We examined the fonts in both printers with several utilities and can't find any differences. We aren't using any TrueType fonts, and we turned off both FinePrint and PhotoGrade, but the results are still the same.

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.
There are slight differences in the way Helvetica fonts are printed on the LaserWriter IIf and IIg when compared to other LaserWriter printers, like the LaserWriter IINTX. Adobe changed the way Helvetica PostScript fonts print. The LaserWriter IINTX has version 001.002 of the Helvetica PostScript font, while the LaserWriter IIf and IIg have version 001.006S.

Adobe controls these PostScript font changes. They make these changes to bring their fonts more in line with the actual fonts they license from various font foundries. In the future, more and more PostScript printers will have this version of the Helvetica font. Apple is neither responsible for nor has any control over this.

Here are two things you can try:
1) Download the Helvetica font (version 001.006) from the Adobe Type Library CD to a LaserWriter IINTX. Then compare the printouts with those from the LaserWriter IIf or IIg.
2) Contact Adobe and find out if version 001.002 of the Helvetica font is still available. Download this older version to the LaserWriter IIf or IIg and compare the printouts to the LaserWriter IINTX printouts.

LaserWriter IIf & IIg: PhotoGrade, RAM, and Image Size

When we print to the LaserWriter IIg, there is a half-inch margin around the outside of each page. We've been printing closer to the edge of the page with the LaserWriter IINT and IINTX. How can we adjust this on the LaserWriter IIg?

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.
These margin differences are caused by the memory requirements of PhotoGrade. The LaserWriter IIg defaults to using PhotoGrade enhancement unless told otherwise. Because a letter-size image -- with PhotoGrade enabled -- needs a frame buffer four times larger than an unenhanced image, the LaserWriter reduces the image size as required. It reduces a letter-size buffer, which would use 3935376 bytes, to a lettersmall buffer that uses 3511296 bytes.

As shipped, the LaserWriter IIg has only enough memory for an a4small frame buffer with PhotoGrade enhancement. Without PhotoGrade enabled, it can easily handle a full legal-sized image, but must be expli explicitly instructed to do so. You can do this in a couple of ways:

- Disable Photograde If the PostScript operator for the required page size is included in the print job, the LaserWriter will disable PhotoGrade to maintain compatibility.

- Modify the Default Parameter You can modify the persistent parameter that forces the PhotoGrade default. This is probably not a good idea unless you find it easier than modifying the printing code. It is inconvenient, and modifies the persistent memory. You can modify the persistent memory a limited number of times before it wears out.

To request a specific page size and override PhotoGrade, include a reference to the required page size in the beginning of the print job. The different page size operators are listed below, along with their memory requirements with and without PhotoGrade enhancement.

PhotoGrade

Page Size	Off	On
b5	741888	2967552
lettersmall	877824	3511296
a4small	924420	3697680
letter	983844	3935376
a4	1015872	4063488
legal	1257344	5029376

If you print a job with no requested page size, the LaserWriter IIf and IIg use the default size of lettersmall. If the job specifies a size, the LaserWriter will try to honor it as closely as possible within its memory limitations. The following table depicts the page size substitution order.

Frame Buffer Substitution Order

```
lettergray -> lettersmallgray -> letter -> lettersmall
legalgray -> legal -> lettersmall
a4gray -> a4smallgray -> a4 -> a4small
b5gray -> b5
```

With the Apple LaserWriter IIf as shipped with 2MB, a request for a letter-size frame buffer results in a lettersmall buffer, the default. Requesting an a4 page results in an a4small buffer. The next table shows the maximum page size available for each memory configuration.

MB	Largest Page Size
2	a4small, PhotoGrade disabled
4	legal, PhotoGrade disabled
5	a4small, PhotoGrade enabled
8	legal, PhotoGrade enabled

In summary, prepending the letter operator to the documents would be adequate. Or you can disable PhotoGrade one time, and leave it alone until you need it again later. Note that the non-volatile RAM used in both the LaserWriter IIf and IIg has a limit to the number of times it can be modified: approximately 50000 writes. While this is a large number, you could rapidly exceed it if the modification were sent with each page or job. Once this part wears out, the factory defaults will be used each time the LaserWriter is powered on.

The following three code segments show, respectively:

- The letter operator at the start of a job
- Code to disable PhotoGrade
- Code to enable PhotoGrade

code segment 1

```
%some sample PostScript with the letter operator prepended
letter

LaserWriter IIf/g & Non-Apple Driver: Default Crops Top Line

When printing from a Sun workstation, the Apple LaserWriter IIf printer cuts off the top line of the image. Claris Tech Support has several other LaserWriter IINTs that work fine. We tried a new LaserWriter llf logic board and got the same results. We then installed a LaserWriter IINT logic board and the issue went away.

We are printing with transcript, system 4.0.3. The printer is connected serially (RS-232) at 19200 baud. The same thing happens at 9600 baud.

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.
This cropping action is caused by the LaserWriter IIf and IIg defaulting to a standard paper size of lettersmall. Normally, printing from an Apple Macintosh Computer to a LaserWriter will also generate a lettersmall size image unless a user specifically checks the "Larger Print Area" option in the LaserWriter driver's Page Setup dialog. If this is done, the size will enlarge to letter, otherwise the driver requests a lettersmall size image. Because you are printing from a Sun workstation, you aren't using the LaserWriter driver and will see whatever defaults the different LaserWriter models use. This is the basic cause of the issue.

Unfortunately, there is another issue with the LaserWriter IIf as it ships with only 2MB of memory. Simply prepending the PostScript "letter" operator would otherwise force a full-size letter image. But because the LaserWriter IIf uses much of its memory for the basic implementation of Level 2 PostScript, it can't expand the frame buffer beyond an A4 small sized image without PhotoGrade enhancement. This means you will need to upgrade the RAM in the LaserWriter IIf to at least 5MB, and even then you'll need to disable PhotoGrade or explicitly request a letter size image.

The process to decide what frame buffer to use depends on these factors:
- How much RAM is installed?
- Is PhotoGrade enabled? (defaults to yes)
- Has the print job requested a specific page size?
- Does the requested size exceed the MaxRasterMemory setting? (Doesn't affect this situation, and requires an in-depth discussion by itself.)

The following table details the frame buffer requirements (in bytes) for the different page sizes, with and without PhotoGrade pre-rendering enhancement.

PhotoGrade

Page Size	Off	On
b5	741888	2967552
lettersmall	877824	3511296
a4small	924420	3697680
letter	983844	3935376
a4	1015872	4063488
legal	1257344	5029376

If a user prints a job with no requested page size, the LaserWriter IIf or IIg will use the default size of lettersmall. If the job specifies a size, the LaserWriter will try to honor it as closely as possible within its memory limitations. The following table depicts the page size substitution order.

Frame Buffer Substitution Order
---
lettergray -> lettersmallgray -> letter -> lettersmall
legalgray -> legal -> lettersmall
a4gray -> a4smallgray -> a4 -> a4small
b5gray -> b5

With the LaserWriter IIf as shipped with 2MB, a request for a letter-size frame buffer would result in a lettersmall (the default). Requesting a4 would result in an a4small frame buffer. The next table shows the maximum page size available for each memory configuration.

MB Largest Page Size
-- ---
2 a4small, PhotoGrade disabled
4 legal, PhotoGrade disabled
5 a4small, PhotoGrade enabled
8 legal, PhotoGrade enabled

If you upgrade the memory to 4 or 5MB, you'll still need to disable PhotoGrade or specifically request letter if they don't want the interpreter to

substitute sizes for them. Prepending the letter operator to the documents would be adequate, or you can disable PhotoGrade one time and leave it alone until you need it later. The following three code segments show, respectively, the letter operator at the start of a job; code to disable PhotoGrade, and code to enable PhotoGrade.

code segment 1

```
%some sample PostScript with the letter operator prepended
letter
/Helvetica findfont 12 scalefont setfont
72 720 moveto
(This is a test) show
```

code segment 2

```
%This code checks to make sure it's running on a IIg or IIf, and then
%disables PhotoGrade in nonvolatile RAM - persisting across power cycles.
statusdict /product get dup

(LaserWriter IIf) ne exch (Apple LaserWriter IIg) ne and
{(This printer likely doesn't support PhotoGrade. Aborting.) =} if
serverdict begin 0 exitserver
<</PreRenderingEnhance false>> setpagedevice
```

code segment 3

```
%This code checks to make sure it's running on a IIg or IIf, and then
%enables PhotoGrade in nonvolatile RAM - persisting across power cycles.
statusdict /product get dup
(LaserWriter IIf) ne exch (Apple LaserWriter IIg) ne and
{(This printer likely doesn't support PhotoGrade. Aborting.) =} if
serverdict begin 0 exitserver
<</PreRenderingEnhance true>> setpagedevice

Claris Resolve: FolderBolt Conflict

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
It appears that FolderBolt 1.0v2, by Kent Marsh, and Claris Resolve 1.0v2 conflict with each other. With FolderBolt installed, each time a Claris Resolve worksheet is saved, a system bomb occurs. As soon as FolderBolt is removed, the worksheet is saved properly.

MacDraw Pro: Use "Precise Placement" for Text Formatting

Does it seem full justification, kerning, or tracking isn't working? You need to change the text placement preference.

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
Q. I set the text in my MacDraw Pro 1.5 document to print fully justified, but the right edge of the text prints ragged. What's happening?

A. You've got MacDraw Pro set to use "standard character placement," which is faster because it skips the routines for fully justifying text, etc. Your printout will also be incorrect if you use the standard setting with kerned or tracked text. Set the preference for "precise character placement," which is slower but supports these extended formatting options. To use this option, choose Preferences from the layout menu, and then select Print options. Then check the Precise Character Placement radio button.

Macintosh Family: Clocks Accurate to 1 Minute Per Month

Can you explain why the clocks on our Macintosh systems are not keeping accurate time? (I've observed this on Macintosh II and Macintosh IIx systems.) The clocks gain as much as 2 minutes a week.

This article has been archived and is no longer updated by Apple.

The real-time clock in the Macintosh family of computers is specified to be accurate to within 1 minute per month.

If the clock is gaining 8 minutes or so a month, we suspect that the clock chip may be bad. Have the computer checked by a service provider. If the problem continues, the logic board may have to be replaced.

MacDraw Pro: Gridlines Display as Solid Lines

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
MacDraw Pro 1.5 displays gridlines as solid lines when:

1- the screen buffer is turned off,
2- running System 6.0.x, and
3- millions of colors monitor setting.

Changing any of these settings will revert the gridlines to display as non-solid.

MacDraw Pro: Shaded Cells Pasted from Excel Shifted

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
In MacDraw Pro 1.5 and earlier, shaded cells pasted from Microsoft Excel are shifted (using Copy Picture).

The following steps demonstrate the issue.

1- In Excel 3.0 or 4.0, fill some cells with a pattern
2- Select the cells, then Copy As Picture (hold Shift key, select Copy As Picture from Edit menu).
3- Paste into MacDraw Pro 1.5. Zoom to 400%

You'll notice that the fill patterns don't align in the cell grid properly. They appear to extend too low. The same cells pasted into ClarisWorks appear correct.

Currently, the only known workaround is to paste into another drawing program, such as ClarisWorks, then copy and paste into MacDraw Pro.

Claris Resolve: Files Not Saved to Correct Volume

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
Saving a MacProject II or Claris Resolve file to a floppy disk with the same name as any mounted hard drive, including hard drives on shared systems, saves to the hard drive instead of the disk.

To Reproduce:

1. Name a disk the same name as a hard drive on your system.
2. Run MacProject II or Claris Resolve and save a file to the disk.
3. Result: The file is not saved to disk, it is saved to the hard drive of the same name.

Claris Resolve Response:

This is a known issue which occurs due to the use of file name strings for accessing files. Given a file name like "HD:foo", it's impossible for Claris Resolve to tell whether to save the file on a hard disk named "HD", or a floppy named "HD" if both are present. This issue occurs under System 6 or 7, and is not an incompatibility with System 7.1.

MacProject Response:

This is a known issue with MacProject II 2.5v1 and earlier. It has been fixed in MacProject Pro.

Claris CAD: Crashing with More Than 10 Layers

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
On a non-accelerated 68000 - based Macintosh (Plus, SE, Classic, PowerBook), the system will crash when showing the Info window for a selected object in a document that has more than 10 layers.

The workaround is to disable the Layer info checkbox in the Object data item in the preferences dialog.

The system will also crash under the same circumstances if you try to export (save) the object data. There is no workaround for this.

This affects all 2.0 versions of Claris CAD

Fifth Generation: SuperLaserSpool Information

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
Here is some information from Fifth Generation Tech Support (800) 766-7283

SuperLaserSpool-
Current ver.- 3.1 rel. May 93. System 7.1 compatible.
Previous version - 3.0, Feb 92. ONLY version compatible with Sys. 7.0
Previous versions are NOT compatible with Sys 7 and are NOT 32 bit clean.

General Requirements: (all versions)
Must have Postscript printer that is compatible w/Apple LaserWriter driver.

Operation:
SLS creates copy of driver called "SLS copy LaserWriter" which it uses, old driver is still kept. Ver. 3.0 dynamically takes needed memory from system heap then releases it when job is finished. Prior versions take amount as specified in "Set Up' from "LaserQue DA". Maximum allowed user set buffer is 1mg (probably desired setting when using MD).

Known Conflicts are: Backgrounder, Easy Access, Gate Keeper and MacroMaker

Fifth Generation business number is (504) 291-7221

Claris CAD: Arrow / Cursor Keys Don‘t Move in Grid Increments

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.

In Claris CAD, the arrow (cursor) keys will move an object one grid division (or multiple of) or one screen pixel depending on resolution. With a ruler setting of .125" = 1' and 8 divisions/foot, it is not possible on a 72 dpi monitor at 100% to move in .125' divisions. It moves the object a multiple of the division; in this case twice the division - .25'. At 200% the resolution is doubled and therefore it is possible to move at .125' division increments. The same results will occur with a 1" = 1" ruler. If you change the zoom from 25% to 12.5% the increments will change from .125" to .25" because an .125" increment cannot be displayed.

The best way to move objects is with the location bar or the info window.

Claris Resolve: Regression Analysis Documentation Error

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
The Claris Resolve User's Guide U91-600-001A pages 6-36 contains a Documentation / Publication error:

The outlined portion of Figure 6-33, representing the Regression Block, includes the row titles in column A. This implies that the range should be A2..E14. Entering this as the range when performing the regression outlined in the example, however, will result in the message "Insufficient number of observations."

The first column in your Regression Range must contain your Dependent variables so the actual range in this example should be B2..E14. The row headings in column A should not be included in the Regression Range.

Applesoft: Documentation Aids

Finding subroutines easily helps you to modify and debug your programs. The following tricks may help you to see what's going on in your software.

This article has been archived and is no longer updated by Apple.

The use of linefeeds (CTRL-J) as the first and last character in the text of your REMs (see example below) makes the text of the remark stand out. Some printers even place the remark at the left margin with the line numbers.

Using colons to indent FOR-NEXT loops makes them stand out, making it easier to identify those needing closing.

```
10 REM THIS STANDS OUT
20 FOR J = 1 TO 10
30 : FOR K = 1 TO 10
40 :: PRINT J * K
50 : NEXT K
60 NEXT J
```

LaserWriter IISC: Engine‘s Page Count Can‘t Be Determined

Is there any way to determine the number of pages that have been printed on a LaserWriter IISC? As far as I know, the LaserWriter IISC has no counter.

This article has been archived and is no longer updated by Apple.
There is no way to determine the actual number of pages that have been printed on a LaserWriter II engine, PostScript or QuickDraw.

The LaserWriter IINT and LaserWriter IINTX controller boards store the number of pages that the controller board has printed, but not the number of pages the engine has printed.

Claris CAD: Custom Line Spacing Saved as EPSF Too Large

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
Text from the Claris CAD application with custom line spacing, saved as EPSF and printed, will print with the lines too far apart. The line height when printed seems to be about 10% - 20% to high. At this time, the only workarounds are:

1- to use standard line spacing, or
2 - use standard line spacing; select a character on each line, such as a space, and change the size to a larger size, thus simulating a custom line spacing.

MacDraw Pro: Easy Install Issue with System 7.1

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
This is fixed in MacDraw Pro 1.5v2

When installing MacDraw Pro 1.5v1 with System 7.1, the Easy Install feature will not work. To install, you must click the Customize button and complete a custom install.

Apple IIe Card Software v2.1 for Macintosh LC

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
Apple IIe Card Software v2.1 for Macintosh LC

A new version of the Apple Ike Card Software (version 2.1) for the Macintosh LC is now available. This new software works when using System Software 6.0.8 or System 7.0.1, a feature not available in the previous Apple Ike Card software (v 2.0). The new Macintosh LC II requires this version of the software when using the Apple Ike Card. The application may be used, but is not required, with the original Macintosh LC.

This new software should be installed by AESCs for Ike cards in K-12 institutions. However, manuals are not included in this update and can be purchased as noted below.

How to Purchase Apple Ike Card Software, version 2.1:

The Apple Ike Card Upgrade package, version 2.1, is available now (Part number M1222LL/B) and includes software and a new manual. The Upgrade comes with a start-up disk with System Software 6.0.8 that can be used to boot your Macintosh and to run the Apple IIe , version 2.1 software.

We recommend customers upgrade to version 2.1 only if they need the new features provided. Customers who need the new software may obtain the upgrade package from an Authorized Apple Reseller.

Macintosh PC Exchange

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
Macintosh PC Exchange

Now you can move files back and forth between your Apple Macintosh personal computer and a PC-compatible computer as easily as you can between two Macintosh computers. YouÕll find Macintosh PC Exchange an especially valuable and time-saving software utility if you work in a mixed platform environment, exchange files with clients or colleagues who use DOS or Windows, or use a DOS or Windows system at work and a Macintosh at home.

To move files from a DOS-compatible computer to your Macintosh, simply insert the disk in any Macintosh that uses System 7 or later and has an Apple SuperDrive or a compatible 3.5-inch or 5.25-inch floppy disk drive. Macintosh PC Exchange does the rest automatically. The contents of the DOS-format disk appear on your screen as standard Macintosh documents and folders. You can open, save, rename, move, copy, and delete them just as you would files stored on standard Macintosh floppy disks. Or you can import them into Macintosh-compatible applications.

Just as easily, you can move files from your Macintosh to a DOS computer. Simply insert a DOS-formatted floppy disk--or let the Macintosh format a DOS disk for you--into the Macintosh and drag the document from your Macintosh disk to the DOS floppy. Then insert the floppy disk into the DOS computer and begin working. ItÕs that simple.

No other software utility gives you such instant access to files. You can even customize Macintosh PC Exchange to automatically launch your favorite Macintosh applications when you double-click on DOS or Windows files. For example, you can set up Macintosh PC Exchange to launch Lotus 1-2-3 when you click on a file created using Lotus 1-2-3 for Windows.

Macintosh PC Exchange Features

Ease of use
- The easiest way to move documents between a PC-compatible and a Macintosh computer
- Fast, simple click-and-drag installation

Compatibility
- Works with leading Macintosh, DOS and Windows applications
- Works with 3.5-inch and 5.25-inch floppy disks formatted using DOS or Windows
- Formats 720K or 1.44-megabyte DOS disks on any Macintosh with an Apple SuperDrive or compatible 3.5-inch floppy disk drive
- Formats 360K or 1.2-megabyte DOS disks on any Macintosh with a compatible, external 5.25-inch floppy disk drive
- Full System 7 compatibility

Flexibility
- Handles DOS and Windows files like Macintosh files, allowing you to copy, rename, delete, and save documents and folders

- Allows you to access DOS and Windows files from compatible Macintosh applications
- Lets you custom configure your Macintosh to launch favorite Macintosh applications when double-clicking on different DOS-formatted files

Technical Specifications

Applications
Macintosh PC Exchange is compatible with all Macintosh applications and many leading DOS and Windows programs, including:
DOS and Windows programs <-> Macintosh applications
Lotus 1-2-3 for DOS/Windows<-> Lotus 1-2-3 1.0 for Macintosh
WordPerfect for DOS/Windows<-> WordPerfect 2.1 for Macintosh
Microsoft Word for DOS/Windows <-> Microsoft Word 5.0 for Macintosh
Aldus PageMaker for DOS/Windows<-> Aldus PageMaker 4.2 for Macintosh
Microsoft Excel for DOS/Windows<-> Microsoft Excel 3.0 for Macintosh
Aldus Persuasion for DOS/Windows <-> Aldus Persuasion 2.1 for Macintosh
Ventura Publisher for DOS/Windows <-> Ventura Publisher 3.2 for Macintosh
Adobe Illustrator for DOS/Windows <-> Adobe Illustrator 3.2 for Macintosh

System requirements
- A Macintosh computer with at least 3 megabytes of RAM, a hard disk drive, an Apple SuperDrive or compatible floppy disk drive

- System 7 or later

MacDraw Pro: Incompatible with Radius Pivot v1.1

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
MacDraw Pro 1.5 is incompatible with the Radius Pivot software (version 1.1) under System 6.0.7 (gray scale or color Pivot monitor). When the text tool is selected and text is typed into any document, it may not appear on screen, and the system may lock up.

MacDraw Pro 1.5 seems to run fine with the Pivot monitors under System 7. Claris tested MacDraw Pro with Radius software 1.1. Radius tested MacDraw Pro with version 2 of the Radius software (Soft Pivot 2.0, Radiusware 2.2). (This version requires System 7).

If you're experiencing computer lockup or crash while running MacDraw Pro with the Radius software, try disabling as many startup documents / extensions as possible (other than the Radius software). If this does not fix the issue, try a complete reinstallation of the system software (trash the System and Finder from the hard disk, then reinstall the system software).

ZUC.Virus: Causes "Crazy" Cursor Movement

This article contains information on what is known as of May, 1990, about the ZUC.Virus.

This article has been archived and is no longer updated by Apple.

A new virus called the ZUC.Virus has been discovered in Italy. It causes the cursor to "go crazy" within a few minutes after an infected application is run.

Preliminary information shows that it infects applications only by adding a 1256-byte piece of code at the end of the first executed CODE resource (much the same way the ANTI virus works).

Ninety seconds after an infected application is launched, ZUC.Virus takes over the cursor and moves it diagonally until you restart. After looking at the code, it seems harmless (though it can restart your machine if it can't get the memory it needs) but VERY infectious.

An infected application can be detected using VirusDetective 3.1.1 (or later), by adding the search string:

Resource Start & Pos -1256 & Data 082A#F1655#30832 ; For finding ZUC.Virus

MacDraw Pro: Command Keys Don‘t Increase or Decrease Font Size

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
The "increase / decrease font size" command keys do not increase the font size of autosize line text.
Published Date: Feb 18, 2012

MacDraw Pro: Rotated Bitmaps Poor on B&W Mac Screen

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
Rotated pixmaps (color/grayscale bitmaps) saved from a color Macintosh and then opened on a black and white Macintosh, are not properly dithering on screen. There is no workaround. (MacDraw Pro 1.5 only)
Published Date: Feb 18, 2012

ClarisWorks: Cell Number Format Reverts to Column Default

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
The number format of a spreadsheet cell will change back to the format applied to an entire column when the cell is formatted as General and data in the cell is changed.

To replicate this issue:

1. Select an entire column by clicking in the column header.
2. Apply the currency number format or another format other than General.
3. Type some numbers into two of the cells.
4. Select one of the cells and change the number format to General.
5. Tab out of the cell to see that the number displayed returns to just the data you entered.
6. Select the cell again, click in the entry bar, and add another digit or otherwise change the value.
7. Tab out of the cell and you will see that the number format returns to the column format.

ClarisWorks: Charts Not Printing in Correct Position

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
In low memory situations, Print Monitor will lose the position attributes of ClarisWorks charts causing them to slide up and/or left. Sometimes, the chart will be omitted entirely.

This seems to happen most often with the StyleWriter printer.

Increasing the memory allocation to Print Monitor via the Get Info window, or turning off background printing in the Chooser solves the problem.

ClarisWorks: Financial/Business Templates

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.

ActaSoft

AlphaCheck Mac

Financial management for home & small business

AlphaCheck Mac software helps you write checks, balance your checkbook, track credit card expenses, monitor your budget, and prepare reports. A HyperCard stack provides a daily register which you export from for making reports with ClarisWorks templates which reconcile your checkbook and generate tax, expense, and income reports. AlphaCheck lists for $59.95.

Payroll Master

Payroll Master uses ClarisWorks to automate the payroll for a small or medium-size business. It automatically produces gross and net weekly, biweekly, or monthly payrolls for any number of employees, and calculates Federal Withholding, Medicare, state taxes, and up to two user-defined deductions. The templates print forms W2 and W3 and post all totals to a report generator that prints payroll stubs and daily, weekly, quarterly, and annual reports. Compatible with AlphaCheck Mac. Payroll Master lists for $95.00.

ActaSoft, 19700 Wells Drive, Woodland Hills, California 91364; (818) 996-6731.

Rosen's Financial Templates

Larry Rosen is author of eight financial books including "The Dow Jones-Irwin Guide to Interest" and "The McGraw-Hill Handbook of Interest, Yields and Returns." He has created 3 ClarisWorks templates:

1) Investment Analysis: Stocks, Bonds, and Real Estate determines the Internal Rate of Return (IRR) for your stock, bond, and real estate investments. This template produces a yearly pretax and after-tax cash flow analysis, the pre- and post-tax IRR for existing or proposed investments, and the revised IRR, including the impact of investing your after-tax cash flows. "Computerized Investing" magazine rated this template a "best buy".

2) Bond Portfolio Manager: computes (1) the market value of your bonds at the lessor of call or maturity value, (2) duration, convexity, and reward-risk indicators for changes in yield, (3) interest received from each bond, and (4) unrealized gain or loss for each bond using taxable basis adjusted for "constant yield" amortization. Reports include: interest, market values, unrealized gain, quality, cash flows, duration, convexity, and portfolio summary.

3) Is It Time to Refinance?: determines whether or not to refinance a mortgage based on: (1) the difference between the old and new interest rates, (2) the costs of obtaining a new loan, (3) the life of the old and new loan, (4) the length of time you plan to keep the property, (5) tax bracket, and other factors.

Each template costs $89 and includes complete electronic documentation. Larry Rosen Company, 7008 Springdale Road, Louisville, Kentucky 40241

This article has been archived and is no longer updated by Apple.

ClarisWorks for Teachers

ClarisWorks for Teachers is a 150-page tutorial and disk published by Claris which takes you step-by-step through the process of preparing a memo for parents, producing a science laboratory report, creating a two-page newsletter, creating a room layout, creating a gradebook, and building a student data base. The tutorials in this book help you develop skills with ClarisWorks. Claris designed the book to supplement the ClarisWorks documentation.

ClarisWorks for Teachers is available from Claris for $29. Claris Corporation, Box 526, Santa Clara, CA 95052; (800) 544-8554; Fax: (408) 655-6099.

ClarisWorks in the Classroom

Prepared by the North York (Ontario, Canada) Board of Education, ClarisWorks in the Classroom contains comprehensive lesson plans for twenty language arts, social studies, mathematics, and science lessons that use ClarisWorks. Published by Claris, this 160-page guide is filled with ideas that can help teachers integrate computers into the elementary and secondary school curriculum. The package includes sample files on a disk and pages you can photocopy for use as handouts or overhead transparencies for your lessons.

ClarisWorks in the Classroom lists for $29. Available after January 15, 1993.

Essentials of ClarisWorks

Jan Harrington

This 270-page student textbook and associated ClarisWorks data disk is the newest in the series of popular "Essentials of..." books published by Course Technology. "Essentials of ClarisWorks" includes an introduction to Macintosh computing and step-by-step instructions that describe how to use the ClarisWorks environments. Each chapter concludes with a series of exercises where you practice the skills you just learned. Cost is $29. Amy Oliver, Course Technology, Inc., 1 Main Street, Cambridge, MA 02142; (800) 648-7450; Fax: (617) 225-7976.

Hands-On ClarisWorks

Arthur Leuhrmann and Herb Peckham

This 496-page textbook is designed for a half-year course in grades seven and above on word processing, databases, spreadsheets, graphics, and communications using ClarisWorks. The Hands-On ClarisWorks package includes the textbook, a copyable data disk with dozens of sample files referenced in the book, a 96-page teacher's guide, and a set of reproduction masters. Cost is $32.95. A sub-set of Hands-On ClarisWorks entitled "ClarisWorks Word Processing" is also available for $24.95. Teachers can examine either set for 30 days without obligation. Then you either pay for or return the sample materials. Computer Literacy Press, 5750H Obata Way, Gilroy, CA 95020; (800) 225-5413; Fax: (408) 848-1483.

ClarisWorks: Templates Providers

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
There are several sources for ClarisWorks templates:

ClarisWorks Users Group (CWUG)
CWUG publishes an 80-page public domain catalog of ClarisWorks templates and ClarisWorks-related products. Among the offerings are 6 user dictionaries: medical, biochemistry and biological, nautical, speech pathology and two others; and 14 disks of ClarisWorks templates for home and small business. Cost is $6.00 per disk. Call for a free catalog. CWUG, Box 701010, Plymouth, MI 48170; (313) 454-1969; Fax: (313) 454-1965.

Heizer Software WorksXchange
Heizer is a longtime provider of templates for Microsoft Works users. Due to the popularity of ClarisWorks, they now offer templates for ClarisWorks. The WorksXchange library consists of hundreds of templates. A special offer of 20 templates to get you up and running is available for $49. Call for a free catalog. Heizer Software, 1941 Oak Park Blvd., Suite 30, Pleasant Hill, CA 94523; (510) 943-7667; Fax: (510) 943-6882.

Claris Forum on America Online
Claris maintains an active forum on America Online which includes software libraries where Claris and America Online members share templates. To find out how to become an America Online member, call (800) 827-6364 between 3 pm and 11 pm Eastern.

ClarisWorks: PBX Dialing w/ Global Village PowerPort Modem

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
The Global Village PowerPort modem (internal PowerBook modem) has problems with PBX dial tones (the dial tone you get before you dial 9 to get an outside line). If you encounter this problem using ClarisWorks communications module with your PowerPort modem, you will need to follow these steps:

1. Create a new ClarisWorks communications document.
2. Choose Connections from the Settings menu.
3. Change the method tool from Apple Modem Tool to the Serial Tool. This is necessary because the Apple Modem Tool automatically begins a session by sending the ATDT command and the number you provide, so you cannot modify the ATDT command.
4. Make sure all other communications settings are correct for the host you will be calling.
5. Choose Open Connection from the Session menu.
6. Type ATX1DT 9, and the phone number you want to dial. X1 modifies the ATDT command to ignore the dial tone. You will not see what you type unless Local Echo is turned on in terminal settings.

ClarisWorks: StyleWriter Print Error Message

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
The following conditions will cause Print Monitor to generate an error message when printing from virtually any application. The error seems to be an issue with the StyleWriter driver, and occurs with all current versions of the StyleWriter driver that support background printing (7.1 - 7.2.2). The best workaround seems to be to turn Background Printing off.

This issue appears to occur under the following conditions
- Running System 6
- Printing to the StyleWriter
- Background printing (Print Monitor) is ON
- The printed document contains text

Macintosh Portable & PowerBook: Using Abroad (3/95)

Can the Macintosh Portable and PowerBook computers operate on voltages used internationally?

Also, will there be any damage to my data by passing my PowerBook through an airport security scanner?

This article has been archived and is no longer updated by Apple.
The Macintosh Portable Power Adapter has the following specifications:

Input voltage

85-270 Volts AC, 120/240 nominal (The Portable itself is rated at 70-270 Volts AC)

Frequency

48Hz to 62Hz, 50/60 nominal (because it converts to DC, the frequency is almost insignificant)

The Macintosh PowerBook 100 series Power Adapter has the following specifications:

Input voltage

100-240 Volts AC

Frequency

50Hz to 60Hz (because it converts to DC, the frequency is almost insignificant)

The PowerBook 200 series power adapter has the following specifications:

Input voltage

100-240 Volts AC

Frequency

50Hz to 60Hz (because it converts to DC, the frequency is almost insignificant)

The PowerBook 500 series power adapter has the following specifications:

Input voltage

100-240 Volts AC

Frequency

50Hz to 60Hz (because it converts to DC, the frequency is almost insignificant)

The Macintosh Portable and PowerBook computers should work fine in any country which falls within the range of specifications above. However, you may need to use an adapter for the wall outlet itself.

The Macintosh Portable and PowerBook computers are powered by the battery at all times, even when the battery is charging. If there is a power outage, you would not lose data unless the battery had insufficient charge to power the computer.

The amount of electromagnetic interference generated by airport security systems varies widely across the world. Security systems in Europe, the Middle East, and Africa have the potential to cause more problems with internal hard disks than systems in the United States. Still, there are very few reports of X-rays or other magnetic radiation damaging computer media. The hard disk in the Macintosh is no more susceptible to problems than other hard disk systems. We suggest you have the system hand-checked whenever possible to reduce the possibility of data loss.

Claris Application: File is Locked or Disk is Full Error Message

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
If you use AutoDoubler by Salient Software, and install a Claris product, but do not launch that product immediately, you can receive the error "File is locked or Not Enough Room on the Disk or Disk is Full".

This is because AutoDoubler has compressed the file since it was installed. The application cannot store the personalization information that is requested the first time the application is launched if the file has been compressed. Essentially, the file is locked.

To resolve this, you should use the DDExpand utility that is included with AutoDoubler to temporarily expand the Claris application. You will be allowed to launch the application and personalize it normally. It's okay to compress it in the future.

ClarisWorks: Can‘t Add Split Pane Tool

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
Problem: Can't add a split pane to split the window. When you drag the split pane tool into position, then release the mouse button, nothing happens.

Solution:
Are you trying to add a third split pane in that direction?
The maximum number of split panes in each direction is two (i.e., two horizontal and two vertical split panes).

Are you trying to add a second split pane in that direction?
When adding a second vertical split pane, the second one must be added to the left of the first. When adding a second horizontal split pane, the second one must be added above the first.

Are you trying to add the first split pane in in that direction?
The spreadsheet may already have a split pane at the extreme left or top of the spreadsheet that may not be readily visible. To test for this, first scroll the window to the home position (cell A1 at the upper left corner of the window).

For a horizontal split pane: Place the mouse pointer over one of the row numbers. Slowly move the mouse into column A. If the mouse pointer changes shape to the double-arrow, you've located the existing vertical pane tool. Using the mouse, drag the split pane to the desired window location.

For a vertical split pane: Place the mouse pointer over one of the column letters. Slowly move the mouse down into row 1.
If the mouse pointer changes shape to the double-arrow, you've located the existing horizontal pane tool. Using the mouse, drag the split pane to the desired window location.

ClarisWorks: Memory Management and Spell Checker

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.

Question:

I'm working in a Claris application and I perform some actions, open a number of documents, copy some information into the Clipboard, and try to spell check my document. The program tells me that there is not enough memory to perform the operation. Why? If I quit the program and restart it, the spell check works fine.

Answer:

The Claris spell checker requires 150k of contiguous memory to check spelling. If there is not enough room within the application memory space, you'll get the "not enough memory" message.

If you close some windows and empty the Clipboard, enough application space memory will be released for the spell checker to operate.

A more permanent solution is to allocate more memory to the application.

ClarisWorks: Filling a Column of Dates Incremented by One Month

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.

Question:
I have a ClarisWorks spreadsheet with a date cell (A2 for this example). I want to fill in a column of payment dates beginning with the 15th day of the month after the date in cell A2 and continuing with the 15th of each subsequent month. How can I do this?

Answer:
There are several formulas that will generate the first payment date. Here are some examples:

Formula 1
= DATE(YEAR(A2+32), MONTH(A2+31),15)

Formula 2
= IF(MONTH(A2)=12,DATE(YEAR(A2)+1,1,15),DATE(YEAR(A2),MONTH(A2)+1,15))

Formula 3
=DATE(IF(MONTH(A2)+1>12,YEAR(A2)+1,YEAR(A2)),IF(MONTH(A2)+1>12,
MONTH(A2)+1-12,MONTH(A2)+1),15)

Formula 4
=DATE(IF(MONTH(A2)=12,YEAR(A2)+1,YEAR(A2)),IF(MONTH(A2)=12,1,MONTH(A2)+1),15)

Let's assume you want to begin the column of payment dates in cell C3. Choose one of the above formulas and enter it for cell C3.

Here's the tricky part. The temptation at this point is to then select Cell C3 and several cells below it and choose "Fill Down" from the Calculate menu. However, you will not get the correct result by doing so.

Instead, click into Cell C4 and retype the formula, changing the cell references from "A2" to Ò"C3".

For example, if you chose to use Formula 1 above, the formula for the second payment date cell should be
= DATE(YEAR(C3+32), MONTH(C3+31),15).

Then select Cell C4 and the number of cells below it that you want filled in with dates and choose "Fill Down" from the Calculate menu.

ClarisWorks: Redraw Problem with Multiple Views

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
In ClarisWorks 1.0v3, there seems to be a redraw issue when viewing the layout and browse screens simultaneously in the same database.

Adjustments to the header in the Layout View can cause duplicate images to appear in the Browse View. This is a minor redraw issue-upon scrolling, the duplicate images disappear.

To duplicate this issue, open any ClarisWorks database. Create a Columnar Report Layout (the field titles will appear in the header). Open two views, one in Browse, one in Layout and make sure that you can see both on screen at the same time.

Go to Page Setup and set Legal paper size and Landscape orientation. Drag a title from left to right in the header, so that it is moved beyond the original page margins (about 8 1/4"). Look at it in the Browse view that you've created (you'll probably have to move to that view and scroll to the right). Now drag that title from right to left, so that it is within the original page margins.

Claris Resolve: File is Clipped or Shows Asterisks When Printed

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.

If you have a file that appears fine on the screen but prints with clipped text, or with asterisks instead of your entries, take a look at the entries in those cells at 400% zoom. Due to the differences between the way that fonts are imaged at the different zoom levels, it may appear perfectly fine at 100%, but you will see the errors at 400%.

Fixing the file at 400% zoom should make it print correctly.

ClarisWorks: Regression Analysis

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
The Regression Range (or Matrix Range) defined when using the Regression option in the Matrix dialog box must include at least one row more that the number of columns specified. For example:

If your Regression Range includes one Dependant variable and 2 Independant variables (3 columns) then at least 4 rows (observations) must be defined (5 if column titles are included).

If fewer rows than columns are defined, the message "Insufficient number of observations" will be returned. If the same number of rows and columns are specified, the message "No observations" will be displayed. Valid results are obtained only when there are more rows (observations) than columns (variables).

32-Bit QuickDraw: Latest Documentation Available From APDA

I'm preparing a report on imaging model characteristics. Where can I get the latest technical documentation available for 32-Bit QuickDraw. I've seen the chapters in "Inside Macintosh, Vol. 5", but I think there must be more recent information.

This article has been archived and is no longer updated by Apple.
As of May, 1990, the most comprehensive 32-Bit QuickDraw documentation is distributed by APDA: "Macintosh System Software 32-Bit QuickDraw" -- Apple Part #M0572LL/A. It contains an updated and expanded version of the materials distributed at the May 1989 Developers' Conference.

(Note that numerous other Technical Notes discuss 32-Bit QuickDraw programming issues, but they are usually more specific to writing code.)

In general, APDA is an excellent source for such information. If you are an Apple Partner or Associate developer, you will have access to information via their monthly mailings, including such resources as Phil and Dave's Excellent CD.

For more information, search under: "APDA"

ClarisWorks: Saving in Merge Format

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
ClarisWorks DB does not save files in Merge format (which includes field names) since ClarisWorks has a built-in merge capability. However, you may need to export a file with the field names for someone else to use as a merge document with an application other than ClarisWorks.

To do this, create a record which has field names in the fields themselves. Once you do this, put a space before one of the field values and sort by that field. It will fall first in the sort order because of the space. Then remove the space and save as ASCII text. The first record will be the field names.

If you copy the field names record, and paste it into the Scrapbook, in the future you can just paste in the record, sort, save as ASCII text and delete the record when you're done.

ClarisWorks: Accuracy Limitation of Minimum/Maximum Chart Range

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
Minimum and maximum chart range settings in ClarisWorks are only accurate to the first digit.

For example, for values under 100, ClarisWorks rounds the min/max settings in the chart dialog to the nearest 10. Thus, a specified range of 25-75 would result in a displayed range of 20-80.

This problem is compounded as numbers go higher. The range 115-150 would result in a chart from 100-200. A range of 115,000-150,000 would yield a chart from 100,000 to 200,000. An excess of 50,000 is certainly not ideal.

A workaround is to ungroup the chart and modify its graphic elements to show only the range you want. However, the link back to the data will be lost so the chart will not update.

ClarisWorks: Calculating Timed Event Sequences

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.

Question

I want to enter 1 start time for the first of a series of sequential events, and the duration of each event in the series. How can I get the program to automatically figure the end time for the first event, and the start and end times for each of the subsequent events?

Answer

Assume that Event Durations are in column A, Start Times in column B, and End Times in Column C. Entries begin with cell A1. Also, each event begins when the previous event ends)

1) Select the first duration cell (A1) and enter the duration for the first event in minutes entered as an integer. (1.5 hours duration would be entered as 90.)
2) Select the first start time cell (B1) and enter the start time (format the cell as TIME using "Number..." from the FORMAT menu)
3) Select the first End Time cell (C1) and enter the following formula in the Entry Bar=TIME(HOUR(C1)+INT((MINUTE(C1)+B1)/60),MOD((MINUTE(C1)+B1),60),SECOND(C1))
4) Hit the enter key to save the formula .
5) Click on cell C1 and drag down as many rows as there are events.
6) Choose FILL DOWN from the CALCULATE menu.
7) Select cell B2 and enter the formula = C1 in the Entry Bar and hit the enter key.
8) Click on cell B2 and drag down to the row for the last event.
9) Choose FILL DOWN from the CALCULATE menu

Now as you add durations for each of your events, start and end times will automatically be calculated for all events.

ClarisWorks: Can‘t Align to Locked Fields or Objects

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.

Locking a field or graphic object in ClarisWorks keeps the object from moving as you work with other objects around it. It can also be useful for keeping other users from moving objects you want to stay in one place. A locked object appears with gray instead of black handles when selected.

If you have a locked field or object and try to use the Align Objects command to align it with another object, ClarisWorks will beep and do nothing. Since a locked object cannot move, the Align Objects command can't be performed. Simply unlock the object by choosing Unlock from the Arrange menu.

ClarisWorks: Documents Not Listed Using the Insert Command

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.

Question: When I select "Insert" in the File Menu, I don't see my existing ClarisWorks documents (Except for Word Processing documents)*, even though I'm in the right folder in the directory. Will rebuilding my desktop make a difference?

Answer: No. The "Insert" command is only in effect for NON-ClarisWorks documents (MacWrite II, MacPaint, PICT, Text, etc.) If you want to insert a previously created CW document into the one you're currently working on, you must open the previously created document , copy the information and paste it into the current document through the clipboard. In other words, the Insert command does not support inserting ClarisWorks documents.

*Word Processing documents do show up, but you will get varying results depending on the version.

ClarisWorks 1.0 for Macintosh:
The file will successfully insert into your new WP file.

ClarisWorks 1.0 for Windows:
You will see the WP file in the Insert dialog, but after selecting it, you will get a message "The file you created cannot be inserted".

ClarisWorks 2.0 for Macintosh:
You will see the WP file in the Insert dialog. After selecting it, your screen will flash, return you to the document you're attempting to insert into, but the text will not be inserted.

A suggested workaround for the Windows and Macintosh 2.0 versions is to save the document you will be inserting later as a file type other than ClarisWorks.

ClarisWorks: Locks Up on Launch or Open File

There has been a report of conflicts between ClarisWorks 1.0 and 2 different chooser documents.

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
There has been a report of conflicts between ClarisWorks 1.0 and 2 different chooser documents. They are the drivers for the LabelWriter Plus 1.3 and earlier, and the QuickLink Fax driver (QL Fax Print 2.1) which comes with Zoom fax modems.

When you launch ClarisWorks with either of these printer drivers chosen, ClarisWorks will display a spinning beachball and then lock up or hang. With the LabelWriter Plus selected, the system crash can also occur when opening a file or creating a new document. However, some customers have reported using the LabelWriter Plus driver without difficulty. (One customer reported that the regular LabelWriter driver worked fine, but the Net LabelWriter driver, the AppleTalk version, would cause ClarisWorks to hang). You may want to contact the manufacturers to get information about latest versions and possible fixes to the problem.

If you have System 7, you can force ClarisWorks to quit by pressing the Command-option-escape keys simultaneously. With System 6, manually restart using either the Programmer's restart switch or turning the computer off and on again.

With the QuickLink Fax software, the lockup can be avoided by turning off 32-bit addressing in the Memory control panel or by selecting another printer in the Chooser before launching ClarisWorks.

ClarisWorks: Ruler Error

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
If you shift the left margin marker to the right a few inches on the ruler in a ClarisWorks word processing document and turn off Show Margins, you will notice a shift of the left margin marker about a millimeter to the right.

If you print the document, you'll find that text prints about a millimeter to the right of the margin setting. This happens whether "Show Margin" is on or off.

The problem seems to be that the margin settings are not accurate when the margins are showing.

ClarisWorks: Creating Spreadsheet-like Reports

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
Note: ClarisWorks 4.0 includes a list view layout type. The following information explains how to create a columnar report to simulate the list view in earlier versions of ClarisWorks.

You may be familiar with other programs like Microsoft Works and AppleWorks. These programs have their own ways of creating database reports with columns and rows. In AppleWorks these reports are called tables reports. In Microsoft Works they are called spreadsheet reports. ClarisWorks calls them columnar reports. Here is a technique to create them.

1. Select Layout from the Layout menu.
2. Choose Page Setup from the File Menu and select landscape orientation (the rightmost one). This will make the next steps easier.
3. Select New Layout from the Layout menu, choose columnar.
4. Move the fields over to the right in the order you want them to appear (e.g. Firstname, Lastname, Street, City, State, ZIP, etc..)
5. Shrink the fields that do not need as much space and move all the fields so they fit nicely across the screen. You might want to zoom out to 50% to make it easier to see the whole page on the screen.
6. Select Page Setup from the File Menu and select portrait orientation (the leftmost one).
7. You need to move body part up to squeeze the size of the body. This will make each record as slim as possible to fit the maximum number of records possible on a page.

To switch between this view of the record and the old view, you would use the layout menu and switch between the two layouts listed at the end of the menu.

To make even more room for fields going across the page, change the paper size to Legal or an even larger size such as Tabloid in Page Setup. This technique works for viewing purposes only unless your printer actually supports the larger page size you select.

TA42104_MacintoshtoNEC_VS_Connectivity_(TIL05504).pdf

Macintosh-to-NEC 370 VS Connectivity

I want to connect a Macintosh to a NEC 370 VS computer. The data stream is in EBCDIC.

- Does the NEC require a proprietary communication package?

- Will a terminal emulator work?

This article has been archived and is no longer updated by Apple.
The NEC 370 VS is based on a proprietary system that NEC describes as having four IBM emulation options: 3470, 3780, 3278 SNA, and 3270 BSC. Contact NEC's Information System Division for more specific information.

Possible Macintosh solutions include MacDFT with the Serial NB Card, or MacNetway from Tri-Data.

ClarisWorks: CWUG Public Domain Library Catalog

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
The ClarisWorks Users Group (CWUG) offers a catalog which describes more than 350 Macintosh disks in their Public Domain Library which contain files from professional developers, other user groups and other CWUG members. In addition to ClarisWorks templates, there are utilities, fonts and other goodies helpful to the ClarisWorks user.

Each 3.5" disk costs $6.00, plus $2.00 shipping and handling per order. Some of the more popular disks are:

Masters. 01. Financial Templates
Area.Codes
Best of AOL
Educ.01 - 15 CW templates for school
Educ.02 - 17 CW templates for schools
Finance.01
Home.01,02,03,04
Forms.01,02 - 95 professionally developed forms
Inventory forms
Art Disks - 26 disks
Desk Accessories - 24 disks
There are 4 dictionaries - biological, speech,computers,microbiology,nautical

ClarisWorks: Default Stationery Documents for Spanish

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
Claris has been shipping a ClarisWorks Bundle program, including both the English and Spanish versions of the applications, to schools in the U.S.

If someone is trying to create stationery documents to be used as default settings for the different document types, the naming conventions used on page 2-25 of the "ClarisWorks Handbook" will not be correct. Instead, use the following naming conventions:

Prefs del PT de ClarisWorks (for Word Processing)
Prefs de los GR de ClarisWorks (for Graphics)
Prefs de la BD de ClarisWorks (for Database)
Prefs de la HC de ClarisWorks (for Spreadsheet)
Prefs de las CM de ClarisWorks (for Communications)

ClarisWorks: Field is Blank/Empty but Sliding Objects not working

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
Sometimes , even after following the instructions in the article "Getting Slide Objects to Work," objects still will not slide correctly through a blank field.

or

Using Match Records or a calculation with the function ISBLANK does work properly evaluate empty fields.

We have found that data imported from other applications (e.g. DIF format from Symantec Q&A on DOS) sometimes includes invisible characters. This causes a field to look blank when really, it contains a value. Thus, the field does not slide.

If this is just happening with 1 or 2 fields and relatively few records, there is an easy solution:

1. Sort the database by the field that 'appears' empty. This will put the fields that appear empty together at the start of your database, or at the end, or both.
2. In Browse mode, click in the field in question that appears (and needs to be) blank.
3. Keeping the Command key held down, type A, then Delete, then Return. This selects all of the contents of the field, deletes it, then takes you to the same field in the next record.
4. Do this (A,Delete,Return) through all 'blank' fields at start and/or end of your database. solution is to perform calculations on all the fields that need to slide.

Another solution is to use calculation fields to strip the invisible characters. For example, if you are printing labels and City, State and Zip are not sliding up through 'Address2' when it contains a blank value, define a calculation with this formula:

Line 2 (Calculation, Text result) = If (ISBLANK ('Address2'),"",'Address2')

Use the calculation field on the label layout in place of the original 'Address2' field. The calculation field filters out the invisible characters.

NOTE: Calculation fields can be changed back into Text fields once they are calculated, and will retain their values. Since this successfully strips the hidden characters, it is a viable procedure for eliminating the corruption, and then returning to a normal file size.

ClarisWorks: Full Justified Text Gets Clipped

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.

If you use the Insert Date or Insert Time commands in the Edit menu to add an item to a full-justified paragraph, the last character on the right side may get clipped by the right margin. This is particularly pronounced when the date is in long format (e.g. January 21, 1991).

The explanation is that the Insert command adds a symbol which ClarisWorks fills in with the date or time, but ClarisWorks does not properly calculate the length of the date or time, resulting in clipped text.

Text on the right side will also get clipped if you create a graphic text object, and format it as italic, full-justification.

If you have ClarisWorks for Windows, you may be able to work around this problem in Windows by turning on Print TrueType as Graphics. Within ClarisWorks, choose Print Setup from the File menu and click the Options button. Select the Print True Type as Graphics check box and click OK. This may slow down printing, but the text should no longer clip.

NOTE: The option for TrueType as graphics is not available as an option in all laser printers, and dot matrix and ink jet printers do not have this capability.

ClarisWorks: Headers and Footers Print on Title Page in Database

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.

In a ClarisWorks database file, you can have a document header or footer in addition to a header or footer part on a layout. If you check the Title page item in the Document dialog, the header and footer PARTS will still appear on every page, but the header and footer items (which you insert with the 'Insert Header' or 'Insert Footer' commands while in Browse mode) will only appear on the first page.

ClarisWorks: ImageWriter Bold Printing Problem

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
There is an issue with ClarisWorks when printing to an ImageWriter. If a portion of a line is selected and the style is set to bold the last word of the bold text will run over into the following word. This only happens with ImageWriter fonts (Geneva, Monaco, New York) when printing in Best mode.

This issue occurs in ClarisWorks 1.0v3 and earlier versions. It is not corrected with the latest version of the ImageWriter driver or ATM/TrueType. However, by using either ATM or TrueType you can get acceptable printing using non-ImageWriter fonts.

ClarisWorks: Installer Conflict with At Ease 1.0

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
At Ease 1.0, a system extension from Apple Computer, is a finder substitute that allows the user to use passwords to limit access to specific files and folders. This extension is likely to have broad appeal to educational sites, where such limitations may be desirable.

There has been a report of the ClarisWorks Installer not functioning properly when At Ease is being used. The solution was to deinstall At Ease before installing ClarisWorks, using the At Ease Installer in conjunction with the option key. Holding down the option key will toggle the Install button to Remove. Simply moving or deleting the At Ease files causes a System crash.

In our testing, there was no problem installing ClarisWorks with At Ease. At Ease settings such as access limitations and passwords may be factors in the reported installer problem.

MacDraw Pro: MathType Character Placement Problem

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
When equations from Design Science, Inc. Mathtype 3.0 software are copied and pasted into MacDraw Pro 1.5, some characters are shifted down, both on screen and print. If you paste the equation into a program that pastes the equation as a single graphic object, instead of interpreting and pasting each object within the equation, it will view and print correctly.

These programs include most word processors and page layout programs, and ClarisWorks. According to technical support at Design Science, this is due to the limitations of PICT format, where the placement of each object is aligned to a 72 dpi grid. This can cause the position of the individual objects in the equation to be shifted to align to the grid, when pasted into other programs.

The best workaround is to save as an EPSF file from MathType, then place this file into MacDraw Pro. The EPSF will print correctly.

ClarisWorks: Number Sequencing Records in Spreadsheet Report

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
The following solution will work in either a ClarisWorks Spreadsheet or a Claris Impact table.

To number sequence records, create a new Spreadsheet or Table and put the following formula in cell A1:

=IF(ISBLANK(B1),_,1)
In cell A2, put the following formula:
=IF(ISBLANK(B2),_,A1+1)
Where an underscore (_) signifies a space.

NOTE: Claris Impact tables do not automatically show row or column headings. To show headings, select TABLE OPTIONS from the TABLE Menu and check "Column Headings" and "Row Headings".

Click on cell A2 and drag down the "A" column until you have selected a range of cells large enough to incorporate all of the records you will be numbering. Choose "Fill Down" from the Calculate menu (Table menu in Claris Impact and save the spreadsheet as "Record Numbering".

In the layout you've created to list your records, select all of the records you wish to number and copy. Open "Record Numbering", select cell B1, and paste.

There are some limitations to this procedure. When you paste into the spreadsheet or table, the columns will be in the order the fields were created. You may need to cut and paste columns until the desired order is reached.

Since the data is in a Spreadsheet or Table, you can use frames in either word processing or graphics frames to make the report more attractive.

ClarisWorks: Objects on Database Layout Disappear

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.

If you set up a layout in one page setup orientation and put objects in a place where they won't show up in a new orientation, then switch to the new orientation, the objects will not appear on screen since they are positioned outside the new viewable area of the page.

To see the issue:
1) Create a database file. Go to the layout and put the body label and a field below 9" on the vertical ruler.
2) Choose Page Setup from the File menu and change the orientation to Landscape (the rightmost option)

You will see that the body part label and the field have disappeared, and you will not be able to get them back by going to Insert Part or Insert Field. The solution is to change back to Portrait orientation, move the items back to where you would see them, then switch to Landscape.

This layout issue is caused by two aspects of ClarisWorks. First, database layouts are limited to one page, so you cannot scroll beyond the bottom of page 1. Second, ClarisWorks allows objects to extend beyond margins and page bounds. This can be quite nice for cropping an object, or splitting it across pages. However, switching to Landscape mode when you have a full-page Portrait database layout simply hides the layout parts and objects which are placed below the new shorter page boundary.

ClarisWorks: Printing Envelopes to HP DeskWriter/DeskJet

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.

One of the paper size options in the DeskWriter Page Setup (or DeskJet Print Setup) dialog is Envelope. When this size is selected, MacWrite II and ClarisWorks set the top and bottom margins to .38". However, the DeskWriter has a minimum bottom margin of .57". If you try to print, you will get the message: "The bottom margin is smaller than the minimum allowed by the printer. The document may be clipped."

The solution is to set the bottom margin for .57" or larger. To avoid having to do this step each time you print an envelope, create a stationery document with the correct settings and open it whenever you want to print an envelope.

Printing using Envelope Assistant (Version 3 and 4)
When using the Envelope Assistant to a Deskwriter 600 series printer, the resulting word processing document has the left margin at 0.31. When you print, the first character or so is not printed. To print correctly, increase the left margin to 0.453 or greater. (This may also happen with other Deskwriters and/or versions of the DeskWriter driver).

To avoid having to do this step each time you print an envelope, save the file (with a blank addressee) as a stationery file. You can later open the stationery file, fill in the addressee, then print.

ClarisWorks: Printing from Layout Mode

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
When printing from Layout mode in the ClarisWorks database environment, the option to print all or only the visible records is unavailable. Pressing OK prints records, not the layout.

It is recommended that you print from Browse mode to avoid confusion and to be able to specify which printing option you want.

If you want to print the layout itself, perhaps as a blank form, create a new record and choose Hide Unselected from the Organize menu. Then print, specifying the visible records option.

ClarisWorks: Renumbering or Adding Serial Numbers to Database

Methods for adding serial numbers to new and existing databases.

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
ClarisWorks 1.0vX does not have a feature for auto-entering serial numbers into database fields. Even in ClarisWorks 2.0 - 3.0, which allows auto entry of serial numbers on creation of new records, imported records will not be serialized. However, there is a procedure you can use to do this.

There are 2 methods for serializing an existing ClarisWorks database. Method 1 is easier. Method 2 is more complete in that it preserves command-tab and carriage return characters within text fields. If you use command-tab to align your data inside a field, the database data would go into the wrong column when pasting into the spreadsheet for serialization. Carriage returns within a field would be seen as a new record(row) symbol by the spreadsheet. Therefore, if you use command-tabs and returns in fields, you need to use Method 2.

Initial Steps

Define a field in the existing database called "SerialNumber." Make sure that the field type is specified as Number.

Use the Save As... command to create a copy of the database in DIF format with a new name. Perhaps "Original.dif". (System 7 Mac Tip: Press Command-D first to save the file to the Desktop where it will be easy to find later.

Choose the Open command, (click the Import Options flag in version 1.0), select Spreadsheet for document type, and open the DIF file you just saved previously.

In the column titled "SerialNumber," type the number 1 in the cell just below SerialNumber. Then click in the cell immediately below the number 1, type the equals key, click on the cell above (with the number 1 in it) and add "+1" (no quotes) to your formula. Hit the enter key.

Select the cell that now reads "2" and drag down to the end of the data in the spreadsheet document. Select Fill Down from the Calculate menu.

Continued (Method 1)

- Click on the Row 1 Header to select the entire row.
- Choose Delete Cells from the Calculate menu (we don't want to create a record of field names).
- Option click the box above the Row 1 Header (this selects all cells with data) and Copy.
- Switch back to the database file and Save As a different name (a backup just in case).
- Select All and Clear to delete all records in the database.
- Paste.

Continued (Method 2)

Select Save As... and save the file as a DIF file with a new name. Perhaps "Serialized.DIF". (System 7 Mac Tip: Command D first.)

Select Open from the File menu, (click the Import Options flag in version 1.0), select Database for document type and open the DIF file you just saved previously. A new database will be created, with the serial number field included.

Change the name of the serial number field to Serial Number in the Define Fields dialog. Be sure it's type is "number".

Select all of the records in the database. Copy. Switch back to the original database. Paste.

To delete the duplicate records created:
Under the Organize menu, select Match Records.... Use the formula:
ISBLANK("Serial Number")
Now with those records selected, choose Clear from the Edit menu.

ClarisWorks: SpaceSaver Conflicts with Claris Help System

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
SpaceSaver, a file compression utility which is part of the Stuffit Deluxe 3.0 package by Aladdin Systems, seems to conflict with the Claris Help System.

For example, with SpaceSaver installed, clicking on the Script Reference button in Resolve Help, will result in a message that there is not enough memory. Also, trying to access help during a scripting session will bring up a message that the Help System cannot be found.

SpaceSaver is a system extension and can be disabled temporarily by holding down the Shift key while starting up your Macintosh (with System 7.X). To disable it completely, or if you are running System 6, remove the file from the system folder.

Aladdin Systems states in their release notes that Claris plans to fix this incompatibility. No release date has been announced by Claris as of 3/24/93.

ClarisWorks: Using the LOOKUP Function

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
You can get a lot of use out of the several LookUp functions built into ClarisWorks (any version). Here is a useful example.

You have a list of grades in number format and you'd like to 'look up' each one's corresponding letter grade. We'll use the vertical LookUp function, VLookUp.

The Formula in cell C3 is =VLOOKUP(B3,E6..F11,1). Since the references to the LookUp table itself (E6..F11) are preceded by dollar signs, it makes this an absolute reference to this location. Therefore, you can (under the Calculate menu) Fill this formula Down the column to get the rest of the grades. (Note that in any LookUp table, the numbers must be sorted in ascending order).

If desired, the column with the numeric scores could be collapsed to a 0 width - the formulas in the next column will still function. The lookup table, though it must be on the same spreadsheet, need not be visible or printed. (The 'Count2' function could then be used as well to add up the total number of A's, of B's, etc contained in the range of computed grades.)

ClarisWorks: What to Do When Dates Don‘t Sort as Expected

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
If after sorting a range of dates, their order is incorrect, chances are that some of the dates are not being seen by ClarisWorks in a valid date format. Here's a way for you to easily spot the ones needing changing.

Select the column with your dates by clicking on its column header, the letter at its top. Now under the Calculate menu, select Insert Cells... This will insert a new temporary column to the left of your dates. (Be sure the format of the column is General)

Let's say your dates are now in column C and you have a new blank column, B. In cell B1, write the formula =C1 and press Enter. Click on the B (the column header) and under Calculate, select Fill Down...

Cells with numbers like 32745 are next to valid dates. Any others will need to be re-entered. Tip: do NOT use leading zeros: 05/02/93 is not a valid date.
When the dates have been fixed, select and delete the extra column (Delete Cells... under the Calculate menu) and Sort once again.

Other Considerations:
In ClarisWorks 1.0, dates can be entered into and sorted within the Database and Spreadsheet environments. The Database sorts dates properly. When entering into the Spreadsheet environment, dates are entered in mm/dd/yy format. Dates which fall on or after 1/1/1911 use an assumed '19' before the date. Dates which fall on or before 12/31/1910 use an assumed '20.'.

This means that when dates which fall after the year 2010 are entered into a ClarisWorks spreadsheet, they are not always accurately represented by the software. If you try to sort based upon three date values, 6/2/92, 9/1/27 and 8/1/99, the 9/1/27 (2027) date will sort first because ClarisWorks thinks it's 1927. (If a date format is selected which represents the information as m/d/yyyy, the 27 date will appear as 1927.)

If you try to work around this by entering your date as mm/dd/yyyy (2/4/2027), ClarisWorks treats the entered date as a text value.

There are two workarounds which will sort properly:

Enter the date as mm/dd/yyyy (February 4, 2027).

Use the Date function and enter the date as Date(2027,2,4). Remember to format as a date since the value returned from this calculation will be a number.

NOTE: Once ClarisWorks has recognized that the date is 2027 instead of 1927, it retains it internally. Therefore, if you want to display a date which reads 2/4/27 and sorts properly, you can enter it using one of the workarounds listed above, then select the mm/dd/yy format from the Number Format dialog. Note that two dates may display the same value but store very different internal data.

MacDraw Pro: Text Disappearing when Entered

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.

MacDraw Pro 1.5v1:
Text sized with the Font Size command will disappear when entered, if the font size is changed before the text is entered.

The following steps reproduce the issue:
1- Click the text tool
2- click in the document to create a text object
3- select Font Size command
4- type a number for a font size (for example 14 and 16), then press Enter
5- Type some text in the document. The text will be the correct font size
6- Press Enter. The text disappears.

Using the Font Size command on selected text works correctly.

Claris Resolve: What is Ingres, DAL?

An explanation of what Ingres and DAL are.

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
Ingres is a database system that runs on mini/mainframe computers. RDBMS is a generic term for Relational Database Management System. Therefore, you may be running the Ingres database software on an HP host machine that uses UNIX as an operating system.

There is a pretty good possibility that you can access data from HyperCard (or FileMaker for that matter). What you need to do is to look into the possibility of using DAL (Data Access Language), Apple's host access technology. DAL requires a server that is placed on the host machine. The host is a sort of translator that is used since each RDBMS has a specific way it expects to receive commands (or queries) from other applications. From that point, applications that take advantage of DAL, communicate with the host by sending queries to the server which in turn translates the DAL commands to the local SQL (Standard Query Language) used by the approved RDBMS'. When the host RDBMS gathers the data it returns it to the DAL server which repackages the information with the DAL language and sends it back to the Mac application.

Therefore, with a general understanding of how the mechanism works let's look at the ingredients.

1) An application that supports DAL and allows you to create DAL queries. FileMaker supports DAL but will not allow you to create a query. You need another application, like MUSE, to create what is called a query document. HyperCard uses the DAL Toolkit which is available from APDA (800 282-2732)

2) A DAL server that is placed on the host. These hosts can be purchased from APDA or the site can speak with their Apple rep. Presently, servers exists for MVS/TSO (IBM mainframes), VAX/VMS (DEC minicomputers), VM/CMS (another IBM system), MVS/VTAM (yet another IBM alphabet soup), and A/UX (Apple's flavor of UNIX). These servers are not cheap. They range in price from $5000-$30,000.

A/UX: Acting As An AppleShare Server (9/94)

Can a Macintosh IIfx running A/UX also run AppleShare File Server and Print Server for 10 other Macintosh IIfx stations -- all on Ethernet? Will performance be impacted?

This article has been archived and is no longer updated by Apple.
There is a public domain software package called "CAP" (Columbia AppleTalk Package) available from Columbia University that allows a UNIX host to communicate using ATP (AppleTalk Transport Protocol), ASP (AppleTalk Session Protocol), PAP (Printer Access Protocol), NBP (Name Binding Protocol), and AFP (AppleTalk Filing Protocol--the client side). This package also includes software called "AUFS" (AppleTalk Filing Protocol UNIX File Server), which is the server part of AFP.

With CAP and AUFS installed in a Macintosh IIfx running A/UX, we believe you can turn a it into an AppleShare File/Print server.

A/UX 3.0 supports System 7's File Share utility, enabling the system to
export both UNIX and Macintosh filesystems to AppleShare clients. It does not support Printer spooling.

The Apple Workgroup Server 95 runs AppleShare Pro and AppleShare Print Server software.

ClarisWorks: Multi-launching Claris Applications on a Server

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
A Claris product can be installed on a server and legally launched by multiple users as long as the server uses a "software mechanism" that meters usage and locks out those concurrent users in excess of the legal number of licensed copies owned.

Macintosh
On the Macintosh platform, AppleShare 3.0 file server software is available from Apple through authorized dealers. Other concurrent use meter options include KeyServer by Sassafras Software, (603) 643-3351 and Quota from Proteus Technology, (403) 448-1970.

To install a Claris application on a Macintosh server for multi-launching, do an Easy Install. Then move the Claris folder from the System folder of the server to the folder that holds the Claris application. Instruct users to copy the Claris folder to their own System folder so that they can use the help, translation, and spelling features. They will only need to do this once. Ensure that you enable the copy protection and concurrent use limit using whatever software mechanism you chose from the list above.

Note: Launching a server-based application may result in a crash at the point of the splash screen display, if the workstation is running a 68040 microprocessor. Apple Computer is aware of the problem, and is distributing a system extension named Network Launch Fix, version 1.0, that corrects the problem. This problem only applies to 68040 computers.

Windows
Concurrent use software mechanisms on the Windows platform include Site Lock from Brightworks Software, 908-530-9650, and App Meter which is available from Funk Software, 617-497-6339. Ask your computer reseller about other options you may have in this software category.

ClarisWorks: Text Color Palette Displays X‘s

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
Now Menus 4.0 conflicts with the Text Color palette of FileMaker Pro (all versions), ClarisWorks 2.0 and Claris Impact This palette pops up when you select Text Color from the Format menu (Text menu in Claris Impact Now Menus renders the colors incorrectly, and converts some colors to an "X". The conflict is corrected by the Now Utilities 4.01p update.

You can get around the issue by holding down the CONTROL key when selecting the drop down menu (this temporarily turns off Now Menus). Another option is to click the Prefs button in the Now Menus control panel and exclude ClarisWorks and/or FileMaker.

In addition, FileMaker Pro 2.0vX may display the incorrect command key equivalents for the Bring to Front, Send to Back, Alignment, or other menu commands if the Now Menus 4.01 Control Panel is active. Now Menus 3.0 did not provide this "on-the-fly" menu modification. Selecting the commands with the mouse performs the correct actions.

Now Menus 4.01 has the ability to remap keyboard equivalents. You do this by selecting the command keys while you have the menu item selected. You can remove them by hitting the delete key while the menu item is selected. Now Menus traps for the keys before they have reached the application so if you map Command-F to the About box, for example, the keys will not reach FileMaker for execution. Simply hit Delete while the About item is selected and it will clear it.

The key equivalent for the Ungroup menu item (command-shift-G) is rendered inoperable by Disktop.Extras which is part of the Disktop package from CE Software. Disktop.Extras comes preconfigured with a command-shift-G option that summons GOfer. Fortunately, the GOfer command key combination is user-defineable, so changing it resolves the incompatibility with FileMaker.Text Color Palette Display X keyboard.

QuickTime movies consist of two parts, the movie file (analogous to the film) and the QuickTime extension (analogous to the projector). An application having QuickTime capability does not actually store the code for the film, what is stored is a pointer to the movie file. When QuickTime detects that a movie file is changed or not in the location specified by the pointer, it goes through an automatic search procedure to attempt to locate the movie file. After a few seconds it will display a message indicating that it is searching (along with a stop button). If it can't find the file, it will display the standard file dialog and ask the user to find it. This search is performed by QuickTime and the alias manager, and is not under the direct control of the application using the movie.

At Ease Version 1.0: Read Me - October Release

Name: At Ease Update (Non-Workgroup) Version: 1.0 Released: June 26, 1996 This update modifies the non-Workgroup versions of At Ease 2.0.x or 3.0, to include Open Transport compatibility. This software is available on the Apple Support Website, Apple Software Updates. It consists of a self-extracting archive of a Disk Copy 1440K disk image. To use, download, double-click the downloaded file (this decompresses it), and use Disk Copy to create a disk. At Ease Update 1.0 consists of 1 disk: Name as Posted Actual Disk Name At Ease Update 1.0.sea At Ease Update (non-wrkgrp)

This article has been archived and is no longer updated by Apple.

From the Read Me included with this software:

At Ease Updater (non-workgroups) Read Me 6/12/96

This application is a utility that will modify the At Ease Startup system extension for At Ease 2.0 and 3.0, non-workgroup versions. Running this utility eliminates a potential startup hang problem with Mac-OS computers running Open Transport.

WARNING: This utility should be used only on a non-workgroup version of At Ease, (called "At Ease" rather than "At Ease for Workgroups"). If it is used on versions 2.0 or 3.0 of At Ease for Workgroups, network access problems may result and you will need to re-install At Ease for Workgroups on the computer. (Running the utility does nothing on versions 3.0.1 or later of At Ease for Workgroups.)

To use this utility, run it on a computer that has an installed version of At Ease 2.0 or 3.0 (non-workgroups).

If the update is successful, you should restart your machine. This utility will append a "+" character to the version string of the At Ease Startup extension file once it has been updated. You can use the Get Info command of the Finder if you want to know if the file has already been updated.

Apple, and the Apple logo are trademarks of Apple Computer, Inc., registered in the U.S. and other countries. At Ease is a trademark of Apple Computer, Inc.

Apple Font Pack: Macintosh Product Info

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
Apple Font Pack for Macintosh

When you really want your documents to look good--to speak more forcefully and more eloquently for you--you need the Apple Font Pack for Macintosh. It opens up the world of type to give you quick, convenient access to 43 exceptional TrueType fonts.

To assemble this distinctive collection of typefaces, Apple worked with the world's leading type foundries. The expertly chosen selection of font families gives you hundreds of ways to increase the impact of your printed work, whether you're preparing a memo, spreadsheet, presentation, newsletter, report, brochure--even a fax.

The Apple Font Pack for Macintosh includes classic text fonts, headline and display fonts, and symbol fonts, all in Apple's TrueType font format. So you're assured great type at any size, both on screen and in print. With the Apple Font Pack for Macintosh you can create tiny footnotes or bold headlines with equal clarity and precision, using your favorite applications and printers.

Use attention-getting Helvetica Compressed, for example, to call out headings in a report classic Delphian or elegant Old English to add a stylish title to your document Nadianne to bring the grace of calligraphy to an invitation or award and Zeal, Apple's new symbol font, to highlight your most important points.

When combined with the fonts that come with Apple's System 7 software, the Apple Font Pack for Macintosh gives you a total of 64 fonts--the entire Apple font library that's included with Apple's LaserWriter IIf, LaserWriter IIg, and Personal LaserWriter NTR printers and that sets the standard for fonts on personal computers.

Features

Excellent selection
- 43 TrueType fonts, ranging from informal to serious, classic to unique
- Ideal for business and personal use, as well as desktop publishing
- Text, display, and symbol fonts for creating a wide variety of documents
- Coordinated type styles that complement one another to ensure great-looking results
- Includes Zeal, a unique new symbol font for graphic accents

TrueType technology
- Outstanding results on screen and in print
- Smooth type that's scalable to any size
- Easy installation and font management

Broad compatibility
- Works with all applications compatible with Macintosh System 7 software
- Supported by all Apple printers and Macintosh-compatible output devices, including Apple StyleWriter, ImageWriter II, Personal LaserWriter LS and NTR, LaserWriter IIf and IIg, and the Hewlett-Packard DeskWriter

Lucida Bright (Regular, Demibold, Italic, Demibold Italic)*
Nadianne (Book, Bold)*
Oxford
Delphian
Old English Text
Onyx
Swing Bold
ITC Lubalin Graph (Book, Demi, Oblique, Demi Oblique)*
ITC Machine

*These exact font style names may not appear in your font menu.
For example, to get Demi you may need to choose Bold in the Style menu.
New Century Schoolbook (Roman, Bold, Italic, Bold Italic)*
Helvetica Narrow (Plain, Bold, Oblique, Bold Oblique)*
Helvetica Compressed (Compressed, Compressed Oblique)*
Helvetica Black (Black, Black Oblique)*
ITC Avant Garde Gothic (Book, Demi, Book Oblique, Demi Oblique)*
ITC Bookman (Light, Demi, Light Italic, Demi Italic)*
ITC Garamond Narrow (Plain, Bold, Italic, Bold Italic)*
ITC Zapf Chancery
ITC Zapf Dingbats
Zeal

Apple Font Pack for Macintosh
Order No. M4040LL/A
- Apple Font Pack for Macintosh with 43 TrueType fonts, Installer, LaserWriter Font Utility, and LaserWriter Driver
- Limited warranty statement

Claris CAD: 2.0v3 Disk Configuration & Installation Procedures

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
Claris CAD 2.0v3 has an installer program. This installer only installs the actual program, and not the supporting files. These additional files must be drag copied to the correct location on the hard disk. In addition, when you make your backup copies of the disks, it is important that the copies are named the exact same name as the originals. Here are the disk configurations, and the location for the supporting files:

Claris CAD Program Disk 1
Claris CAD Installer - double click to launch installer

Claris CAD Program Disk 2
Installer Data 1 - used by the Installer

Claris CAD Utilities
Installer Data 2 - used by the Installer
Standard Formats - place in your Claris CAD application folder
GD&T font - drag to the System Folder icon (System 7) or use Font/DA Mover 3.8 or higher (System 6)
MacPlot Driver - put at the top level of the System Folder (NOT in the Extensions folder)
MacPlot Configure - put at the top level of the System Folder
Claris CAD XTND (a folder)
Claris XTND System - put in the Claris folder (in the System Folder)
MacPaint 2.0 - put in the Claris Translators folder (in the Claris folder)
MacDraw II 1.1 - put in the Claris Translators folder (in the Claris folder)
TIFF - put in the Claris Translators folder (in the Claris folder)

Claris CAD Help
Claris CAD Help - put in the Claris folder (in the System Folder)
Claris Help System - put in the Claris folder (in the System Folder)
ClarisCADFon - put in the Extensions folder (in the System Folder)
ClarisCADFonII - put in the Extension folder (in the System Folder)
BEROL RapiDesign Sampler - put in your Claris CAD application folder
8 Color Stationery - if you have a color monitor, rename this file "Claris CAD Options", and put it in the Claris folder (in the System Folder). If you have a Black and White monitor, you do not need to install this file.

Claris CAD Tutorial
FileMaker Pro Object Database - put in your Claris CAD application folder
Section 1 - put in your Claris CAD application folder
Section 2 - put in your Claris CAD application folder
Section 3 - put in your Claris CAD application folder

Note: In each Tutorial Section, there are two folders - one for Macintosh II (with 13" monitors), and one for the 9" screen monitors.

Macintosh: System 7.1 Software

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.

Macintosh System 7.1 Software

Macintosh System Software Version 7.1 brings your Apple Macintosh personal computer more powerful capabilities and greater ease of use. System 7.1 comes with all of the features of the original System 7 release. One of the most significant advances in personal computing since the introduction of the Macintosh, award-winning System 7 makes any Macintosh computer ready for hundreds of applications that take advantage of its power. And since System 7 runs virtually all current applications, you'll enjoy its benefits right away.

Built-in file sharing allows you to share files over an AppleTalk network, simply and easily. Multitasking lets you keep several applications open at once and continue to work while you print, search for, copy, or share files. Publish and Subscribe lets you create links between documents, so when you make a change in one document you see the change made automatically in all related documents--such as spreadsheets, reports, and presentations.

System 7 also includes Apple's TrueType font technology, which displays letters perfectly on the screen with no jagged edges and produces outstanding results from almost any printer. System extensions such as QuickTime allow you to cut, copy, and paste everything from video footage to animation and sound--as easily as you work with text and graphics today. Providing new, more far-reaching tools, System 7.1 comes with Apple's new WorldScript technology. It will support versions of System 7.1 in most languages, and will pave the way for your Macintosh to become a multilanguage personal computer.

Out-of-the-box power
- New Finder simplifies working with folders, documents, and applications
- Built-in file sharing with security features
- Improved multitasking for working with several applications at once
- Publish and Subscribe for automatic document updating across applications or networks
- TrueType advanced font technology
- New Font Folder provides a single location for all fonts, including TrueType, Adobe Type 1, and bitmapped fonts
- Aliases for access to documents and applications from two or more locations
- Virtual memory for running more applications without adding RAM Compatibility
-> Runs on any Macintosh computer with at least 2 MB of RAM (4 MB recommended)
- Runs virtually all Macintosh applications

Ease of use
- Simple, sure, one-step installation
- "Learn as you work" Balloon Help

The Finder
The Finder displays all of the pull-down menus and icons needed to manage files, folders, disks, and applications in the Macintosh and over a network. It includes:
- Apple menu with Control Panels, desk accessories, and other selected items
- File menu
-- Locate files by name, date, size, label, or kind
-- Open applications, documents, and folders
-- Print documents and directories
-- Share folders with other users
-- Make an alias for an application, document, or folder
-- Get file information
- Edit menu, to Cut, Copy, and Paste information
- Views menu
-- View the contents of a Finder window by icon, name, size, kind, date, or label
-- View an outline of a folder's contents
- Labels menu, to assign labels or colors to icons
- Special menu
-- Clean up windows and desktop
-- Sort by icon, name, size, kind, date, or label
-- Erase the contents of disks
-- Restart and shut down the computer
- Balloon Help menu, to display information about items on the screen
- Application menu, to switch among open applications
- Trash container, to discard files and folders

Control Panels
Control Panels let you change many of the settings for the Macintosh, and include:

- General controls for desktop patterns and color, time, and date
- Startup device, to select the disk drive to be used for startup
- Mouse, to set mouse speed and respon-siveness
- Keyboard, to set keyboard repeat rate and layout for international use
- Monitors
-- Choose the number of colors/grays to display
-- Specify positions of multiple monitors
- Color, to select highlight and window color
- Memory, to increase system memory by using hard disk space, set the disk cache, and turn on 32-bit addressing
- Labels, to customize labels in the Finder
- Views, to customize icons and information
- Sharing Setup, to identify the Macintosh to the network, start file sharing, and turn on program linking
- Network, to specify network cabling system (LocalTalk, EtherTalk, or TokenTalk)
- Users & Groups
-- Administer names and passwords of users who will have access to files and folders
- Sound, to specify system alert sounds and volume levels
- Date and Time, to customize formats for displaying dates and times
- Numbers, to customize formats for display of numbers

Desk accessories
- Chooser, to select printers, file servers, and other network resources
- Key Caps, to display characters of different fonts
- Alarm Clock/calendar
- Four-function Calculator
- Eight-page Note Pad for text
- Scrapbook for storage of frequently used graphics and text

Built-in TrueType fonts
- Times (plain, bold, italic, and bold italic), Helvetica (plain and bold), Palatino (plain, bold, italic, and bold italic), Symbol, Courier (plain and bold), Chicago, New York, Monaco, and Geneva

Utilities
- Apple File Exchange, Disk First Aid, LaserWriter Font Utility, Teach Text, Apple HD SC Setup

Software extensions
- Supports QuickTime, Macintosh PC Exchange, AppleTalk Remote Access, At Ease, ColorSync, and other system software extensions

Print drivers
- ImageWriter, LaserWriter, Personal LaserWriter LS, Personal LaserWriter SC, ImageWriter LQ, Apple StyleWriter, AppleTalk ImageWriter, AppleTalk ImageWriter LQ

System requirements
- A Macintosh personal computer with 2 MB of RAM (4 MB recommended for running multiple applications) and a hard disk

System 7 Personal Upgrade Kit Order No. M7200LL/A
- System 7.1 software (six 1.4 MB disks)
- "Before You Install" with Compatibility Checker 2.0 (one disk)
- QuickTime Extension and Scrapbook (one disk)
- Complete setup, learning, and reference documentation
- 1 year of toll-free upgrade assistance
- Limited warranty statement

System 7 MultiPack (up to 10 users) Order No. M7201LL/A
- System 7.1 CD-ROM disk with:
-- System 7.1 software
-- System 7.1 disk images (800K and 1.4 MB)
-- "Before You Install"with Compatibility Checker 2.0 (one disk)
-- Networking Administrator Tools
- Floppy disks of all System 7.1 software (six 1.4 MB disks)
- QuickTime Extension and Scrapbook (one disk)
- Complete setup, learning, and reference documentation
- System 7.1 Administrator's Handbook
- 1 year of toll-free upgrade assistance
- Limited warranty statement

System 7.1 Update Kit* Order No. M7202LL/A
- All software and accessories included with System 7 Personal Upgrade Kit

- System 7.1 Update Guide
- 1 year of toll-free upgrade assistance

*For users of System 7 or System 7.0.1. Available from Apple Computer, Inc.; contact your authorized Apple dealer for details.

ClarisWorks: Exchanging Files with FileMaker Pro 2.0

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.

The DIF format should be used to import and export files to and from FileMaker Pro. This format preserves the field names which will make it easier to merge files.

When opening a DIF file that was exported from FileMaker Pro 2.0, ClarisWorks automatically creates the fields necessary to accommodate your data. Each field has the same name as it did in FileMaker and uses Text as it's field type. Since ClarisWorks matches field names while pasting, this makes it easy to exchange information between ClarisWorks and FileMaker databases on a consistent basis.

ClarisWorks: Disappearing Menu Titles

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
There have been several reports of menu titles disappearing in the ClarisWorks word processing environment, specifically the Format and Style menus.

There does not seem to be one cause. However a few patterns have emerged:

The issue only occurs if you switch to another application which has a fewer number of menus than the seven that ClarisWorks WP has. When you switch back to ClarisWorks, the Format and Style menus are missing.

Several extensions seem to be related to the problem, all of which modify the menu in some way. MenuMaster, Disk Doubler, Directory Assistance, Now Menus and Caps Lock extensions have all been reported as suspects.

Workaround:
Opening a document in another ClarisWorks environment and then closing it reestablishes the Format menu. You can also close all WP documents and reopen a WP document.

Apple IIe: Video Signal "NTSC-Compatible", Not "NTSC-Compliant"

I bought Sharp XA305 video recorders to record the video from my Apple IIe systems: however, I am able to record only black and white pictures.

I tried the same setup with an older Sears model VCR and it worked perfectly. I tried a new camcorder and got only black and white pictures again. Sharp told me that this is because the Apple IIe has a substandard NTSC signal.

Can you help?

This article has been archived and is no longer updated by Apple.
The composite video signal coming from the Apple IIe is not stated to be an NTSC-compliant signal. The signal coming from the video-out port is only considered NTSC-compatible video. "Compatible" means that generally the Apple IIe video will work with an NTSC device, although it may not work in all situations. Specifically, the Apple IIe video signal should work with all NTSC display devices.

When the Apple II was first designed, economy was of great importance. The video circuitry was built with as few parts as possible. In the design process, it was discovered that certain portions of the NTSC broadcast specification could be omitted, yet still display a color image on a standard television set. The one element that affects the described situation is color burst. The Apple IIe does not contain the color burst element of the NTSC video signal. By modulating other portions of the video signal, the Apple IIe simulates this missing information and allows an image to be produced on a television. To provide a consistent color video image for video tape, this color burst needs to be present.

In summary, the Apple IIe composite video signal was designed for display proposes, not for videotaping purposes. The Apple IIe composite signal is close to the NTSC specification and allows the video signal to be displayed on television screens. This, however, does not indicate that the signal can be recorded. Since the signal is similar to the full NTSC specification, video sometimes records properly on videotape with certain VCRs. In other environments, the signal may not record at all. The capability to record a monochrome image falls between these extremes.

To have a true NTSC signal designed for videotaping, the Video Overlay Card is required.

ClarisWorks: Editing Charts

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
To edit a chart as individual graphic elements, you must first Copy or Cut it, then Paste and Ungroup. Note: Ungrouping a chart breaks the link to the spreadsheet data so it will not update with changes.

Explanation:
Only a PICT or WMF file can be ungrouped. When a chart is initially created, it is not a PICT/WMF since it is still tied to the spreadsheet that originally created it. This is done to allow for the automatic updating capabilities of a chart.

Therefore, to be able to ungroup a chart to edit its individual elements, it first must be copied and pasted to transform it into a PICT.

MacDraw Pro 1.5: Conflict with Suitcase 2.1.1

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.

When running Suitcase 2.1.1, drawing arcs by dragging in certain directions in MacDraw Pro 1.5 does not work. The arc will not draw. However, this seems to occur only in the first document window after launching MacDraw Pro. Therefore, the workaround seems to be to close the first document window, then reopen it. Or, just open a second document window.

Windows with Norton Desktop Doesn‘t Exit

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
Situation:

Able to move the mouse but the cursor is in the hourglass mode, the machine appears to have frozen, bombed, hung.

Cause:

When this issue occurs, it is one of three corrupted file types:

Binary files (*.bin)
These files contain Norton Desktop's configuration settings and passwords.

Data files (*.dat)
These files contain various parameters that are passed to Norton Desktop icons, windows, and includes the layout of windows on the screen.

QAG files (*.qag)
These files are the files that Norton Desktop uses to contain subgroups and files in an iconized format.

Note: Usually this issue is due to a corrupted group (*.qag) file.

The Solution:

Get to a DOS prompt (usually a cold boot (reset or power off) is necessary).

Rename the files with the above listed extenders to some obscure letter combination (for example, change *.qag to *.q27) because you may need them later. These files are in the main directories for Norton Desktop for Windows and Windows (usually NDW and Windows).

Load Windows with NDW (WIN at the DOS prompt) and then choose File Exit OK.

First, try copying the Quick Access group (QAGmain.xxx) back to QAGMAIN.qag, load Windows, and then try to exit back to DOS. If you are successful, repeat the process with the other groups until you find the defective group, and then you will have to replace it or rebuild it from Program Manager groups. If you are not successful, then at least your Quick Access group is defective.

If your Quick Access group is defective, run Windows, create a new group, and write down the file name of the group. Move all other groups and icons into this group. Reboot the system, delete the *.bin and *.dat files, and run Windows. At this point, your Quick Access group is working fine. Try to exit Windows, if it is successful, the defective group is fixed, if it is not, repeat the above process until the defective group is fixed. The groups most likely to be corrupted are Quick Access, Startup, and any groups opened during the current session before Windows is exited.

MacDraw Pro: Screen Update Slower When Increasing Application RAM

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
Increasing the memory allocation for MacDraw Pro can cause screen updating to be slower.
This can happen under the following conditions:
-- The computer's monitor is set to 2-color
-- The document contains a pixmap (a color/grayscale bitmap)

Under these conditions, MacDraw Pro attempts to dither the pixmap on screen so that it isn't displayed as a solid black block. This is actually an intended feature of MacDraw Pro, and is what is happening during this delay.

Any of the following actions cause MacDraw Pro not to dither the pixmap, hence eliminate the delay:
1. Change the monitor setting so it isn't 2-color (not much help when on a PowerBook, but good to know when using a different Mac
2. Turn on Image Greeking in Preferences
3. Reduce the memory partition (as you've already discovered). MacDraw Pro will detect that it doesn't have enough extra memory to calculate the dithering, so it won't try.
4. If the scanned image is 2-color black and white, try resaving from your scanning software in a different format (TIFF or PICT). Many scanning programs, when saving a black and white scan as a PICT or TIFF file, do not save the file out as a true bitmap file (strictly black and white). Or, the application may save it as a bitmap in one format, but a pixmap to the other format. If the file were saved as a true bitmap file (not a pixmap), this would solve the problem, as MacDraw Pro will not attempt to dither a bitmap file.

MacDraw Pro: About Version 1.5v2

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
MacDraw Pro 1.5v2 is identical to 1.5v1 with the following exceptions:

1. The application and EPSF translator have been updated to fix these problems:
-- Text disappears when clicking out of a text box to which font, size or paragraph attributes were applied via dialog before typing any text.
-- The Installer did not correctly overwrite the existing MacDraw Pro Help and Claris Help System files, resulting in files named MacDraw Pro Help.2 and Claris Help System.2.
-- The Installer did not install the MacDraw Pro Help file in the Claris folder. It is installed in the Application folder.
-- The Easy Install option did not recognize system 7.1 as a valid system and did not allow an easy install.
-- EPSF images print distorted or reduced in size if they are first imported and saved as MacDraw Pro version 1.0 using the its EPSF filter, then the document is opened and printed in MacDraw Pro 1.5v1.
-- Gridlines display as solid black lines when running system 6.0.x in millions color mode with the screen buffer turned off.
-- Command-Option-Space does not hide and show the tool and style palettes when running system 7.1. Command-Option-Tab added as a duplicate keyboard shortcut for use with 7.1.
-- System crashed when sending an oapp Apple event with when the application is running without a document open.
-- Compatibility with QuickTime 1.5.
-- Gray Scale images saved to EPSF, had incorrect information and print B&W or not at all.
-- Certain applications create open polygons such that when they are saved to PICT and opened in MacDraw Pro they are incorrectly closed.

Occurred in MacDraw Pro 1.0 also.
-- PICT rounding error results in clipped objects when imported or pasted in MS-WORD, MacWrite, etc.
2. The installer script on the installer disk has been updated to correctly over-write the MacDraw Pro Help, MacDraw Pro HyperTour files and older Claris Help System files and place the MacDraw Pro Help file in the Claris Folder.
3. The Claris Help System file on the Help disk has is no longer stuffed in a StuffIt Archive.
4. The EPSF filter stuffed on the Reference disk in the translator folder has been updated to version 1.0v4.
5. The Read Me file on the installer disk has been update to include MacDraw Pro 1.5v2 changes.

ClarisWorks: Techniques for Simulating "Smart Fill" Capabilities

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
Here are some techniques for creating sequences of data such as a column of serial numbers or successive dates using formulas and the Fill command in the ClarisWorks spreadsheet environment.

Sequence of numbers
1. Enter the starting number in a cell (A1)
2. Enter a formula in the cell below or to the right which adds 1 or some other increment to the starting cell (=A1+1)
3. Select and drag from the cell with the formula to the last cell you want to fill to.
4. Choose Fill Down or Fill Right from the Calculate menu.

Sequence of dates
1. Enter the starting date into a cell.
Follow steps 2-4 above. Then choose Number Format and choose one of the date formats. Otherwise, the dates will be in the form of a serial number.

To create a list of month names starting with January:
1. Enter the following formula into any cell:
=MONTHNAME(MOD(ROW(A1)-1,12)+1)
2. Select and drag from the cell with the formula to the last cell you want to fill to.
3. Choose Fill Down or Fill Right from the Calculate menu. (Substitute the COLUMN function for ROW if using Fill Right.)
4. The bullets in the value indicate that the cell formula refers to itself. To remove them, choose Display from the Options menu and turn off "Mark circular references."

To create a list of day names starting with Monday:
1. Enter the following formula into any cell:
=DAYNAME(MOD(ROW(A1),7)+1)
Follow steps 2-4 in the directions for month names.

To create the alphabet:
1. Enter the following formula into any cell:
=CHAR(64+MOD(ROW(A1)-1,26)+1)
2. Substitute "96"if you want lowercase letters.
Follow steps 2-4 in the directions for month names.

Note: The formulas for month names, day names and the alphabet all work by same method. The MOD function returns the remainder of a number and divisor. The number of occurrences of the unit (12 for months, 7 for days of the week, and 26 for the alphabet) is used as the divisor and ensures that the number which generates the name or character is always within the unit range, even if you fill down for hundreds of cells. The ROW or COLUMN function in conjunction with the way the Fill command increments cell references does the job of creating the sequence of data, regardless of what cell you begin with.

FileMaker Pro 2.0 for Windows: QuickTime Support Announced

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.

SANTA CLARA, Calif., Nov. 10, 1992 -- Claris Corporation today announced that FileMaker Pro 2.0 for Windows database management software will support QuickTime for Windows, introduced today by Apple Computer, Inc. The Macintosh version of FileMaker Pro 2.0, the number-one Macintosh database, already supports QuickTime.

With the QuickTime Player in both versions of the application, FileMaker Pro 2.0 will be able to embed QuickTime images in specific fields in a dababase, and even share those images across Macintosh and Windows networks.

Claris said QuickTime for Windows is an important step forward in cross-platform database management. While storing text and numbers is vital, users' definition of "data" is expanding to include sound, graphics and video.

With its superior graphical user interface and sophisticated database power, FileMaker Pro 2.0 provides the tools, high-quality output and immediate productivity that Windows users most want. Since no programming knowledge is required, even new users can be immediately productive -- yet power is not sacrificed for ease of use.

The QuickTime Player allows FileMaker Pro 2.0 to display or play QuickTime movies in a database field by using "pointers" to the QuickTime images. This means that FileMaker Pro 2.0 can efficiently manage many megabytes of QuickTime images without the overhead of actually incorporating these images into the database. More importantly, FileMaker Pro 2.0 fully maintains top performance levels while handling large multi-media data structures.

Claris said a revision to FileMaker Pro 2.0 for Windows, sometime in 1993, will add QuickTime for Windows capabilities.

A breakthrough in cross-platform computing
For the increasing number of businesses where sharing information among PCs and Macintosh systems is crucial, Claris has defined a new standard for how applications should work cross-platform. The Windows and Macintosh versions share 85 percent common source code and are designed to look and work alike. This has enabled the greatest possible interoperability and makes support and training much easier than for any other cross-platform applications.

FileMaker Pro 2.0 for Windows and FileMaker Pro 2.0 for Macintosh share the same file format so databases created on a PC or a Macintosh can be run on either platform without modification or translation. Windows and Macintosh users can simultaneously share reports, forms, graphics and scripts and update common files and lookup related data across the network painlessly. When multiple users are sharing data, instant file updating automatically reflects changes made by any one of the users.

Pricing and Availability
FileMaker Pro 2.0 for Windows and Macintosh is available now from authorized resellers.

MacDraw Pro: White Text Prints Black to DeskWriter C

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
White text prints as black to the DeskWriter C when printing a TrueType font. Bitmap and Adobe fonts appear to print correctly. Versions tested included 1.0/2.0 of the DeskWriter C driver, and MacDraw Pro 1.5v1. The DeskWriter 3.1 driver prints white text correctly.

MacDraw Pro: GCC WideWriter Prints White Rectangles

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.

Printing to a GCC WideWriter printer may produce white rectangles on the output that do not appear on the document on the screen. You can remedy the issue by deselecting the 'Accurate Pattern Fills' option in the Page Setup dialog.

GCC is aware of the issue and is working on a fix.

ClarisWorks: Bad Alias in Performa Launcher

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
The Macintosh Performa series computers come pre-installed with an application launching program called "Launcher."

It works by creating aliases of applications and placing them in a special folder. On some machines, the alias for ClarisWorks is bad, causing an error when choosing ClarisWorks from the Launcher application.

To correct this issue:

1. Find the actual ClarisWorks application.

It should be located in the ClarisWorks folder which, on Performas, is located inside the Applications folder on the hard disk (Macintosh HD:Applications:ClarisWorks:ClarisWorks).

2. Make an alias of the file by selecting the ClarisWorks icon (do not double click) and choosing Make Alias from the File menu.

3. Open up your System Folder on the hard disk and locate the "Launcher Items" folder. Open this folder and Trash the ClarisWorks alias located there.

4. Drag the new alias created in step 2 into the Launcher Items folder and restart your machine. The Launcher should now correctly find and launch the ClarisWorks application.

ClarisWorks: Clip Art Issue

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
NOTE: This is not an issue with ClarisWorks 2.0 since it has a Painting environment.

Q: I bought some MacPaint (bit-map) clip art to use with ClarisWorks 1.0 but when I insert or open the document, I get the whole page with no way to select only the art I want.

A: Clip Art generally comes in one-page documents with several pieces of art per page. ClarisWorks 1.0 imports graphics as one object and does not have the ability to edit bit-maps.

There are 3 alternatives:

1. Purchase the upgrade to ClarisWorks 2.0

2. If you have a Paint program such as BrushStrokes, Canvas, SuperPaint, MacPaint, or PixelPaint use it to open the clip art and lasso only the part you want. Copy it to the clipboard. Then in ClarisWorks, you can Paste it in and treat it as a graphic object, scaling it, duplicating it, etc.

3. If you do NOT have a Painting program, here is how you can use HyperCard (Development version 2.0 or later).

1. Launch the HyperCard program.
2. Under File, choose New Stack. Do NOT "Copy Current Background."
3. Set the size of the new stack to MacPaint in the pop down menu. Name the new stack something like HyperClipArt for later use.
4. You are now in a new, blank stack. Under Go, select Message and type into the message box that appears: set userLevel to 3 and press Return
5. From the Tools menu, select the lasso tool (to the left of the pencil).
6. Choose Import Paint... from the File menu and navigate to your clip art file. Then click Open.

This creates a new card in your stack with the clipart on it. You can move to the bottom of the page by grabbing the page through the little Scroll window that has appeared (or, if it has not, select Scroll from the Go menu) You can now use the lasso to select just the image you want. Copy it, switch to ClarisWorks and Paste.

ClarisWorks: Converted AppleWorks File Appears Empty

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.

Q: When I import a word processing file from AppleWorks, it appears empty. What's happening?

A: Click anywhere in your document and then under Edit, choose Select All. Now under Style, choose Text Color and select black.

During the conversion process, sometimes the font color will be set to white and thus the data seems to be non-existent.

ClarisWorks: How to Get a Page Break when Importing Text

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.

Q. I want to import a text file into ClarisWorks and include page breaks. I tried using the Form Feed character to get the page break, but it's converted to a simple return. What do you suggest?

A. ASCII 12 (hex $0C) should give you the page breaks you need.

ClarisWorks: Printing Edge Feed Envelopes to a LaserWriter

Printing Edge Feed Envelopes to a LaserWriter.

Note: This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Knowledge Base. This article has been archived and is no longer updated by Apple.
Both MacWrite II and ClarisWorks WP provide incorrect margins when choosing Envelope - Edge Fed in Page Setup... from the LaserWriter driver. The default margin settings will cause the application to return an incorrect margin message when attempting to print.

Correct (Minimum) margin settings for edge feed envelopes:

Top: 4.42
Bottom: 0.25
Left: 0.43
Right: 1.46

This is not an issue for ClarisWorks Graphics documents which is the recommended environment for creating envelopes.

TA42160_EtherTalk_History_and_Users_Guide_(TIL05510).pdf

EtherTalk: History and User‘s Guide

This article discusses the history of the EtherTalk card, EtherTalk software, and their various revisions.
This article has been archived and is no longer updated by Apple.
Apple Computer introduced the EtherTalk Interface Card (later called EtherTalk NB card) and EtherTalk 1.0 software for the Macintosh II in August of 1987. Since that time, the card and software have gone through many revisions. This article describes the revisions and shows which cards and software to use on various Macintosh computers.

HISTORY

1987
EtherTalk card revisions A through D
EtherTalk 1.0 and 1.1 software

March 1988
EtherTalk card revision J

The revision J card fixed a rare data corruption problem that occurred when the EtherTalk Interface card retransmitted a packet that originally had encountered a collision. The data corruption manifested itself as changed characters in documents being printed or filed on an AppleShare server. This problem only occurred in heavily loaded networks, with large numbers of active nodes, intensive use of network resources, and dissimilar types of computer equipment.

The revision J upgrade also included a fix to an incompatibility problem with some co-processor and memory expansion NuBus cards that access memory in the $xxxFxxx range. This problem is very unlikely to occur since most NuBus cards have their declaration ROM in this address range.

A free upgrade program to revision J was offered from May through October 1988. Some service providers extended the upgrade program on a case-by-case basis.

(Note: Some of the pre- revision J cards that were reworked were marked with revision letters G through J in order to differentiate the original version of the card. [Revision A cards became G; revision B cards became H; etc.] Revision G through J are functionally equivalent.)

July 1988
EtherTalk 1.2 software

EtherTalk 1.2 was a software workaround for an obscure hardware problem in the EtherTalk card that caused an AppleShare server on Ethernet to crash. It also fixed an obscure bug in the software that would cause the card to send packets to a non-existant node and eventually crash.

January 1989
EtherTalk card revision K

The revision K card fixed an incompatibility between earlier EtherTalk cards and the Macintosh IIcx. The problems occurred because the capacitance of a six-slot NuBus Macintosh was factored into the timing mechanism of the EtherTalk card, and was inappropriate for a three-slot Macintosh. The problem was most likely to occur when only one card was present. (This would be the case for routers and servers where no video card was necessary because they were monitored remotely, using Timbuktu for example.)

Symptoms of the problem are intermittent and include:
- system fails to boot
- system errors
- exceedingly poor network performance

No upgrade program to revision K was offered.

June 1989
EtherTalk 2.0 software

EtherTalk 2.0 offers support for AppleTalk Phase 2, including reduced broadcast traffic, extended addressing, and better router selection. EtherTalk 2.0 packets are in the 802.3 format, while EtherTalk 1.0 packets were in the Ethernet format. EtherTalk 2.0 nodes don't see EtherTalk 1.0 nodes, unless a router is setup to run both versions of the software. (See LAN Minds training for more information.)

A customer can ask their Apple Systems Engineer for the EtherTalk 2.0 software or they can send in the form located in the Upgrade and Update Programs folder under the Apple Programs icon on AppleLink. (As of this writing, the form says it expires on March 1, 1990, but that will be changed. Note that a customer who sends in the form after March 1990 will receive EtherTalk 2.0.2, described below.)

October 1989

EtherTalk 2.0.1 software

EtherTalk 2.0.1 software offers better performance, especially on the Macintosh IIcx and IIci. The EtherTalk 2.0.1 software includes additional NOPs (no operations) in the .ENET driver in the System File, in order to synchronize the timing of the card with the timing of the faster Macintosh IIcx and IIci. The EtherTalk2.0 file that a user sees in the System Folder was not changed.

(Note: It is difficult for a customer to make sure she is using the correct version of EtherTalk software, since only the .ENET driver changed names and version number.)

December 1989
EtherTalk card Revision L

The Revision L card is a new layout of the original card (with new ROMs), removing the cuts and jumpers that were necessary for the previous upgrades. Because the card is a new layout, no upgrade program has been offered from J and K.

From the A/UX side, Rev L is required because the Macintosh IIfx is so much faster that the larger (64K) buffers are needed to keep up with the machine. Also, there were a number of NuBus interface details fixed in Rev L that the Macintosh IIfx needs. Only the A/UX drivers take advantage of the extra memory.

March 1990
EtherTalk 2.0.2 software

EtherTalk 2.0.2 software offers better performance, especially on the Macintosh IIfx. The only change to the software is that some more NOPs were added to the .ENET driver, which is installed in the System File. The EtherTalk2.0 file that a user sees in the System Folder was not changed. A customer should use the utility (mentioned above) from Technical Communications to make sure they are using the correct .ENET driver.

When a customer uses the System 6.0.5 Network Installer diskette, the new 2.0.2 .ENET driver is automatically installed, regardless of the EtherTalk installer diskette used.

Customers who upgrade to the Macintosh IIfx will be told to be sure to use the System 6.0.5 Network Installer diskette to re-install EtherTalk software.

ETHERTALK COMPATIBILITY

Macintosh II or IIx	Macintosh IIcx or IIci	Macintosh IIfx
hardware Rev J, K, or L	Rev K or L (Rev L on Macintosh IIci)	Rev K, L or M
software EtherTalk 2.0.1 or 2.0.2	EtherTalk 2.0.1 or 2.0.2	EtherTalk 2.0.2

Note: There is a remaining bug that affects Macintosh IIci owners who use EtherTalk 2.0.1 or 2.0.2 software and the EtherTalk revision K card. Ethernet performance is adversely affected when a user starts up the Macintosh IIci in 2 bit [4 colors] or more, using on-board video. To work around this problem, the user can use a revision L card, or not use on-board video [i.e. use a video card], or use only black-and-white video.

Note: EtherTalk 2.0.x should be used in AppleTalk Phase 2 installations only. For customers who have not upgraded to Phase 2 yet, EtherTalk 1.2 is provided in a folder called Previous Version on all EtherTalk 2.x diskettes. Use the installer to install EtherTalk 2.0.x, but then drag the EtherTalk file in the Previous Version folder into the System Folder on your startup disk. This will insure that you have the correct .ENET driver in your System File, but the Phase 1 version of EtherTalk in your System Folder. See the EtherTalk NB User's Guide for details.

ClarisWorks: Restoring Database Field Text to Default Font/Size/Style

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
Q: When I change text in a field to Bold, it shows up that way in all my layouts, even ones where the field is set to Plain text. If I set the text back to Plain, then it appears Plain in another layout where it is set to Bold. What I want is for all text in all fields to revert back to their default settings.

A: Once you change the font, size or style of text in a field, it will retain those attributes in all layouts. The following procedure will restore all text to the default format defined in each field. Do this on a copy of your database in case you accidentally delete some records.

1) In the database, click anywhere outside of a field to select an entire record.
2) Now under the Edit menu, choose Select All, then Cut.
3) Under File, choose New and click on Spreadsheet, then OK.
4) Paste. (This has stripped out all font attributes.) Now Copy.
5) Return to your database and Paste.

ClarisWorks: "Not Enough Memory" Opening in Microsoft Works 3.0

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.

Microsoft Works 3.0 will give the message "Not enough memory" when attempting to open a file saved from ClarisWorks as MS Works 2.0. This happens even if it is a small file and you allocate extra memory to MS Works.

Saving the file from ClarisWorks as either Microsoft Works 1.1 or Microsoft Word 4.0 allows the file to be opened by Microsoft Works 3.0.

Published Date: Feb 18, 2012

ClarisWorks: "This File is Corrupted" Message

When a file is corrupted, ClarisWorks gives the generic message: "This File is Corrupted." If you are getting this message repeatedly as you work in ClarisWorks, you may have a corrupt ClarisWorks Macros file in your Claris folder.

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
By saving a macro file into the Claris folder/directory in the System folder, and naming it ClarisWorks Macros, it will automatically load when you launch ClarisWorks. If this file becomes corrupted, ClarisWorks opens it but then keeps alerting you that the file is damaged.

Similar problems could occur if you create a ClarisWorks WP Options file and it becomes corrupted. In this case, you would get a file corrupted message when creating a new WP document.
Published Date: Feb 18, 2012

ClarisWorks: ImageWriter Page Setup Options

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
Tall Adjusted and 50% Reduction will always be grayed out in Page Setup when printing from ClarisWorks to an ImageWriter. MacWrite II and FileMaker Pro offer these options, whereas ClarisWorks does not.

In addition, ClarisWorks does not support custom paper sizes. A shareware utility called My Page Setup can modify the Page Setup dialog to enable you to create custom paper sizes within ClarisWorks. This utility has not been fully tested with ClarisWorks, but seems to work well with the Graphics and Database environments. It is unstable in the Word Processing environment.

Claris Applications: Installing on a Partitioned Drive

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
If your hard drive has been partitioned and if you have chosen to name one of those partitions the same name as one of the disks of the Claris product you are attempting to install, you may run into an error.

For example, FileMaker Pro 2.0 comes with four disks:
1. Install 1
2. Install 2
3. Utilities
4. Examples

During installation, when you insert "Install 2" when prompted, the message "Utilities has the correct name, but is not the correct disk" may appear even if you have not inserted any disk. The installer is finding a partition named "Utilities". Changing the name of this partition allows for a successful installation of FileMaker Pro.

Claris Applications: International Dictionaries

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
Claris currently provides dictionaries in twelve languages, available separately for US$49 each, and available through Claris Customer Assistance:

U.S. English, British, French, German, Spanish, Danish, Dutch, Finnish, German(Swiss), Italian, Norwegian, and Swedish.

Languages which include a hyphenation file:
U.S. English, British, French, German, Spanish, Italian, Swedish

Languages which include a thesaurus:
Danish, Dutch, Finnish, German(Swiss), Italian, Norwegian, and Swedish.

The British Dictionary provides a total of 100,000 words, the French, German and Spanish provide over 200,000 words.

Claris products allow you to install only one international dictionary at a time, with the exception of MacWrite Pro. You may install as many international dictionaries as you wish with MacWrite Pro. By assigning language "styles" to text, each portion of your document will be spell checked with the correct dictionary. Other Claris applications require you to switch the installed dictionary via the Install Dictionaries command in the Edit menu.

International dictionaries can be used with any version of the following Claris products: ClarisWorks, ClarisImpact, MacWrite II 1.1, MacWrite Pro, FileMaker Pro, MacDraw II 1.1, MacDraw Pro, MacProject II 2.x, and MacProject Pro.

MacWrite Pro 1.5 and ClarisWorks 2.1 require an updated dictionary and thesaurus. A Main Dictionary 2.3 update and an International Hyphenation update which includes French, Spanish, German, Italian, Swedish, and British hyphenation files is available in Claris online forums on CompuServe, America Online, AppleLink and the Claris BBS (408-987-7421, settings 8/N/1). A disk is also available through Claris Customer Assistance.

MacDraw Pro: Text Grayed Out at Low Zoom Levels

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
With MacDraw Pro 1.5 a new preference was added in order to provide faster text handling at lower zoom levels (25 or 50%). This preference allows text to be replaced by a gray pattern when a font size threshold is achieved. This preference is new to MacDraw Pro 1.5 and does not occur with MacDraw Pro 1.0.

The preset setting for this preference (Greek text) is 6 points. So for example 12 point text when viewed at 50% would normally be displayed as 6 point text. As a result, in MacDraw Pro 1.5 the text would be displayed as a gray rectangle.

Since this is a preference, you can change the point size at which the text display will change. Continuing with our example, setting the Greek Text preference to 5 points or less would allow the 12 point font to display as letters.

To change this preference:

1. Select Preferences from the Layout menu.
2. Click on the Display panel icon
3. Change the point size at which Greek text is set.

Macintosh IIfx: Termination (4/95)

This article contains information about Macintosh IIfx termination and external terminators.

This article has been archived and is no longer updated by Apple.
There have been 4 different external terminators distributed by Apple. Two are identical except for the part number.

Part Number Description
---------- ----------
590-0304 The original terminator.

590-0695-A Replaces 590-0304. This is the new PLATINUM terminator

590-0695-B
& 590-0705 These are BLACK and are identical, except for the part
. number. Apple built approximately 10,000 having the part
. number 590-0695-B; later manufactured black terminators
. are numbered 590-0705. One black terminator ships with
. every revenue Macintosh IIfx, but can be ordered
. separately from Service using part number 590-0705.

. Note:
. Only 1 black terminator is ever needed at a time; more
. details are below. These black terminators are
. officially called the Apple SCSI Cable Terminator II.

The Other Two Macintosh IIfx SCSI Bus Components

Internal SCSI Termination Block

The Internal SCSI Termination Block provides internal termination resistance for Macintosh IIfx systems WITHOUT INTERNAL HARD DRIVES. All Macintosh IIfx computers that shipped without internal hard drives had the Internal SCSI Termination Block installed. This component plugs into the Internal SCSI Filter and it looks like a "T", with a 50-pin female connector on the bottom.

Internal SCSI Filter

The Internal SCSI Filter provides termination capacitance for internal Macintosh IIfx hard drives that shipped prior to March 19, 1990 or any third-party hard drives. After that date, Apple hard disk drives shipping in the Macintosh IIfx contained the proper termination capacitance. The filter has a 50-pin female connector on one end and a 50-pin male connector on the other. When connected to an internal drive the drive cable should be connected directly into the logic board and plug the Internal SCSI Filter block between the drive cable and the 50-pin connector on the hard drive. When there is no hard drive the SCSI Filter is connected to the logic board, and the Internal SCSI Termination Block is connected to the filter.

All Macintosh IIfx computers that shipped without internal hard drives had the Internal SCSI Filter and the Internal SCSI Termination Block installed. When you add a third-party drive remove the Internal SCSI Termination Block, but leave the Internal SCSI Filter connected to the logic board. Termination needs to be provided by the resistors on the internal third-party drive.

Determining What Terminators to Use and When

No External SCSI devices Connected

Termination is provided by either the internal hard disk, or by the Internal SCSI Termination Block.

With a Third-party Internal Drive

The third-party drive should be internally terminated. Plug the drive cable directly into the logic board and plug the Internal SCSI Filter block between the drive cable and the 50-pin connector on the hard drive (Cable and filter order is important for this to terminate correctly). The Internal SCSI Termination Block needs to be removed (it looks like a "T"). Plug the drive cable directly into the logic board and plug the Internal SCSI Filter block between the drive cable and the 50-pin connector on the hard drive.

With Any External SCSI Devices Connected

Use only ONE black terminator at the end of the SCSI chain. Make sure that all built-in terminators are removed from external third-party SCSI devices (Apple's external SCSI devices do not contain internal terminators).

NOTE:
A flyer in the Macintosh IIfx Finished Goods box instructs customers to
return self-terminating SCSI devices to the Service Provider to disable the termination. Removing the termination can be performed by the user in some circumstances--a user should refer to the owners manual or check with the manufacturer if they are uncertain.

WARNING:

Under no circumstances should you use more than one black Apple SCSI Cable Terminator II on any external SCSI chain. This may damage the logic board or whatever device is providing termination power.

With An Internal Disk Drive And External SCSI Device

Both the internal SCSI drive and the last SCSI device in the external SCSI chain need termination, and you need to plug the Internal SCSI Filter block between the drive cable and the 50-pin connector on the hard drive.

Why Is There A New Black Terminator For The Macintosh IIfx?

One of the features of the Macintosh IIfx is a new SCSI chip that provides SCSI data transfer rates up to 3MB per second, faster than any earlier Macintosh systems. To achieve these transfer rates, components on the Macintosh IIfx logic board are smaller and faster, this makes them more susceptible to signal reflections on the cable. The new terminator adds the filter capacitors and changes the resistor values for some of the signals to reduce the reflections.

How Can Third-party Drives Take Advantage Of The Higher Scsi Throughput?

Any SCSI hard drive that can sustain transfer rates above 1.25MBps will operate faster on a Macintosh IIfx. No Apple hard drive, including the HD160 SC, takes advantage of this higher transfer rate.

What To Do With Less Common System Configurations

In some remote cases someone might remove the internal drive from a Macintosh IIfx they will not have the correct internal termination. In this situation, you should order and install a Internal SCSI Termination Block (Apple Service Part #590-4515) and Internal SCSI Filter (Apple Service Part #590-4516), and use the black terminator if you have any external drives; however, if you don't have access to an internal termination block, you can connect use the new platinum terminator (590-0695-A on the terminator) to the beginning of the SCSI chain and, as always, connect the black terminator at the end of the chain. Again, what is preferred is to order the Internal SCSI Filter from service.

ClarisWorks: Pasting Number Formatted Data from SS to WP

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.

When a number is copied from a spreadsheet cell, any number formatting using the Format:Number command is ignored (display in <2> decimal places, currency, commas, display of negative numbers). What is copied is the actual value that is stored in the cell. For example, consider a cell with the formula "=5/23" formatted to display as a fixed number with two decimal places. The number displayed on screen is .22, but the number stored in the cell is 0.21739130434782609. This longer value is what will copy and paste into other programs or ClarisWorks modules, such as the word processor.

There is no way to copy cell values in their formatted result. A suggested workaround is to create a spreadsheet frame in the word processing document and paste the values into it. You can select the frame and choose Display from the Options menu to turn off row and column headings. Also, you can paste a spreadsheet frame in-line with your text so it flows with changes. To do this, Cut the frame, click where you want to insert it in the text and paste.

Another workaround: if you're only using the Format:Number command to format to a fixed number of decimal places, you can edit the formula in the spreadsheet cell to use the Round() function. This will cause the number stored in the cell to be fixed to a specific number of decimal places. In the example above, the formula "=Round(5/23,2)" results in the number .22, which will copy and paste as expected.

Claris Resolve: Date Conversion Formula for Incorrect Dates

I have a column of imported data that I need to convert to a valid date. For example, cell A1 contains 600827 which really represents the date 08/27/60. How do I convert it?

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
Here's a formula that will convert the data to a valid date of 08/27/60.

=Date (1900+Value (Left (Str (A1),2)),Value (Mid (Str (A1),3,2)), Value (Right (Str (A1),2)))

By means of explanation.
The Left (), Right () and Mid () functions are used to strip out values in certain positions.
These functions require a text value, so the Str () function is used to convert the numbers to text.

The Date () function, however, requires numbers as arguments, so the values returned by the Left (), Right () and Mid () functions need to be converted back to numbers by use of the ValueÊ() function.

ClarisWorks: Can‘t Insert Fields on Layout

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
The ClarisWorks database environment only allows you to insert a field onto a layout once. You cannot have multiple copies of a field on the same layout.

If when Inserting a Field onto a layout, the field does not show up in the list, it is already on the layout. If you cannot find the field on the layout, it may be outside the page boundaries. When you change page orientation, fields may fall out of the page boundary. It is also possible to move fields off the edge of the layout, especially by using "Select All" and dragging something down from the top of the layout.

To find fields which may be outside the page boundary, try switching page orientations or page sizes until they become visible. Another solution is to just create a new layout.

ClarisWorks: Changing the Line Weight of a Chart

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.

ClarisWorks 1.0

The ClarisWorks 1.0 Handbook states that you can change the line weight of a chart by clicking on the legend element and choosing a new line weight from the palette. This does not work. You can change color and pattern but not line width.

The work-around is to copy the chart and paste it back in as a graphic object. Each line becomes a selectable object and line weights can be modified. However, the chart no longer maintains its link to the spreadsheet data.

ClarisWorks 2.0

ClarisWorks 2.0 adds the capability to modify chart line weights. However, only line weights of 1 point and larger are supported. Changing a line to Hairline will cause it to switch to None instead.

ClarisWorks: Translating MS Works PC 2.0 Files

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
The MS Works 2.0 translator included with ClarisWorks only works with files created by the Macintosh version of the Microsoft Works application.

The PC version of the MS Works uses a different file format that is not compatible with the Claris XTND filter. Transferring files from Works on the PC, therefore, will require converting the data into an intermediate ASCII text format.

MacDraw Pro: Can‘t Import EPSF from Freehand 3.0/3.1

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.

MacDraw Pro 1.0 and 1.5 will not import EPSF files from Freehand 3.1 that have a PICT Preview. When attempting to import, a "not enough memory" alert may be displayed (among other symptoms). These EPSF images will import correctly into FileMaker Pro 2.0 and ClarisWorks 1.0 (since neither of these programs attempts to parse out the objects in a PICT on import, these programs may be more 'forgiving' of the format of the PICT Preview). Two workarounds:

1- Export the EPSF from Freehand 3.1 without a PICT Preview, then import into MacDraw Pro.

2- Try option-copying the image from Freehand, then pasting into MacDraw Pro.

According to Claris SQA, Freehand uses fixed point numbers in their EPS boundaries, rather than integers, as specified in the Adobe EPS spec.

ClarisWorks: Grays Print as Black or White

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.

When printing the gray colors in the top row of the color palettes (both pen and fill) to a QuickDraw printer such as the ImageWriter or a Personal LaserWriter LS, the grays print as solid black or solid white.

The darker gray colors (more than 50% black) print as solid black, while the lighter grays print as solid white. They do not print as dithered patterns simulating gray colors. The only workaround is to use the gray patterns in the pattern palettes instead of the gray colors.

This problem exists in all versions of ClarisWorks 1.0 (v1 - v3).

Published Date: Feb 18, 2012

ClarisWorks: Border Patterns Not Printing on TI MicroLaser Plus

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
There has been a report that drawing a square and applying one of the non-grey patterns (the ones below the first two rows) to the pen will cause the document to not print to a TI MicroLaser Plus. The document prints successfully when a gray pattern or no pattern at all is applied to the pen.

According to the Texas Instruments MicroLaser Plus manual: "Some high-resolution halftone images and color graphics require more memory than the printer has as a standard. In such a case, the printer returns to the online idle state without printing anything or gives a 'limitcheck' error message."

Texas Instruments recommends the 1MB memory upgrade.

Claris Technical Support has not verified that the memory upgrade will solve the problem.

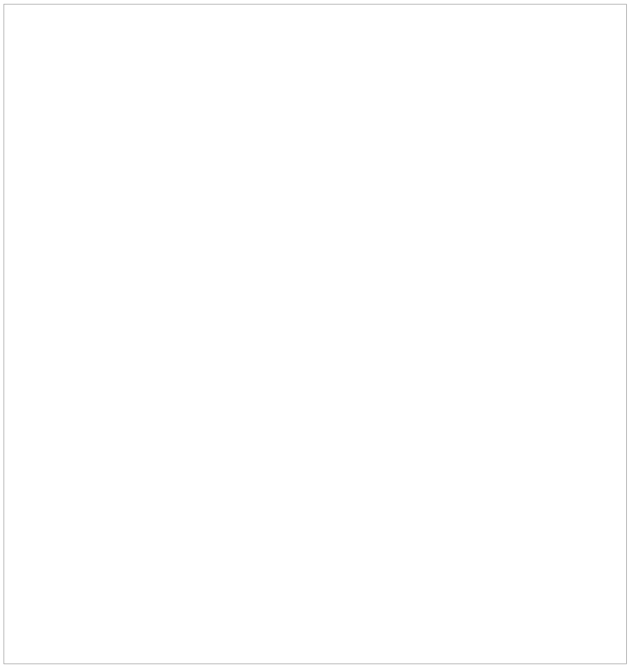
ClarisWorks: Can‘t Make Chart Correctly with Numeric Division Ranges

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.

If the division labels within chart data are numeric, the Make Chart command does not correctly make a chart. It interprets the division labels as data to be charted. Look at the picture field for a sample set of data to be charted. In this example, the data has a single series of data and three division labels (1990, 1991, 1992). Since these years are interpreted as numeric data, when you choose Make Chart, it charts the years as though they were data (with no label for the series).



In ClarisWorks 2.0, you may choose "Use Numbers as Labels" from the General Chart Options window.

In ClarisWorks 1.0, enter ="1990" into the cell instead of 1990.

Published Date: Feb 18, 2012

ClarisWorks: Communications and the Mac IIfx Serial Port

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
The Macintosh IIfx has a special serial port which works in "faster mode" by using a buffer. This can cause connection problems when using the ClarisWorks communication environment. Older modems are particularly problematic in conjunction with the "faster mode."

There is an freeware INIT, available from users groups, AppleLink and BBSes, called Serial Switch. This control panel device will allow the serial port to be switched to its slower, more conventional mode. This may or may not fix the problem, but is a good first step for IIfx owners experiencing connection problems.

ClarisWorks: TrueType Versus Bitmap Character Shape Differences

TrueType versus Bitmap Character Shape Differences.

Note: This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Knowledge Base. This article has been archived and is no longer updated by Apple.

TrueType vs. bitmap differences:
With some characters, like a Geneva "y," the TrueType version is different from the bitmap version. For example, a TrueType Geneva 12 pt. "y" is poorly shaped.

MacDraw Pro info:
Unlike most other applications, MacDraw Pro always uses the TrueType font over the bitmap. So, a Geneva 12 "y" will look poor in MacDraw Pro but look correct in other applications. You can force MacDraw Pro to use the bitmap by removing the TrueType font from your System file.

Note: Geneva 12 is stored as a resource inside the System file in System 7.

Claris XTND System On Technologies

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
On Technology is one of the developers licensed to use the Claris XTND technology. The XTND file sent to the developers is 1.3.1, while CLARIS uses 1.2 or 1.3. As a result, some system errors (bombs, crashes) may occur when XTND 1.3.1 is installed and the Claris Translators are accessed when converting a Microsoft Word document to a MacWrite document.
Published Date: Feb 18, 2012

FileMaker Pro: Postscript Error when Printing EPSF Graphic

Some imported EPSF graphics may generate a PostScript error when printing. There have been occurrences where the graphic printed correctly from FileMaker Pro 1.0vX files, but are now generating PostScript errors after being converted to FileMaker Pro 2.0vX.

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
Grouping PostScript objects increases their complexity significantly, and may generate the PostScript error.

Solution:
If updating or replacing the printer driver does not fix the problem, the solution is to go back to your original PostScript graphics application and make sure there are no grouped objects in your graphic. Re-save your graphic as an EPSF document and re-import it into your layout.

This problem is corrected in FileMaker Pro 2.0v3.

FileMaker Pro: Draft Printer Skips Records or Prints Garbage

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.

Many draft printers have a dip switch to toggle between Epson and IBM ProPrinter modes. If you get garbage, lose data, or skip records or labels when printing, try switching printer drivers to match the emulation mode. Switching to either the Epson FX-80 or the IBM ProPrinter 24 driver usually solves the problem.

You can also check your printer manual to determine which dip switch sets the emulation mode and set it to match your printer driver.

NuBus Speed Benchmarks (1/96)

I need NuBus specifications for speed, bandwidth, throughput, and relationship to processor speed.

This article has been archived and is no longer updated by Apple.

The following specifications are not TRUE benchmarks, but can be used as a primer to understand the variables influencing the "relative" throughput of NuBus.

Though the NuBus speed is designed to be processor- and architecture-independent, it varies depending on the NuBus card and Macintosh used. We don't have specific benchmarks, but in general, the NuBus "throughput" ranges from around 7MB to 37MB per second depending on the Macintosh, NuBus card, and application used. Generally, increases in NuBus throughput are influenced more by the NuBus card's design and function than by the use of a "faster" CPU.

NuBus throughput is faster on a Macintosh IIsi, Macintosh IIci, Macintosh IIfx, or the Macintosh Quadra computers, because the processor clock rate is faster than the 16MHz for other Macintosh II computers. These Macintosh computers, therefore, are faster at bus arbitration on the processor side, and the processor responds faster to NuBus accesses. For example, the increase in speed with the Macintosh IIci is approximately 20 to 30 percent when going out to NuBus or coming back.

The typical time required to go from the processor bus to the NuBus card is about 700ns, as is the time in reverse: going from the NuBus card back to the processor. The time remains constant whether moving 1 or 4 bytes of data. (These times are representative of the Macintosh II using the Macintosh II Video Card.)

Other cards, such as the Macintosh 1-Bit Video Card, support what we call "dump and run." A Macintosh II has a transfer rate of about 20MB using

this card because each 4-byte write-only takes only 200ns, and the data goes right into video RAM on each cycle. This card immediately acknowledges each cycle on a write, whereas the Macintosh II Video Card could take more than one cycle for the data to move into RAM.

Cards that support the NuBus burst mode could achieve transfer rates of up to 37.5MB when going from NuBus card to NuBus card, which is the case with some graphics accelerator cards to video cards. With these cards, the first access takes 200ns, and each subsequent access up to 16 takes only 100ns.

Because of the overhead processing video, any performance increase over one of the other Macintosh II computers is negated when using a Macintosh IIci or Macintosh IIsi with the internal video in 8-bit mode. Setting the internal video to 1-bit, or having a NuBus video card, will ensure maximum NuBus performance in these systems.

Note: For information about Macintosh computers based on the 68040 or PowerPC microprocessors, see these related articles in the Tech Info Library:

"Power Macintosh and NuBus Q&A"

"68040 CPU Architecture: NuBus Transfer Modes and Performance"

Claris Windows: Changing the Default Directory in Windows

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
Claris Windows applications by default save data files in the subdirectory where the program resides. For example, FileMaker Pro files are usually saved in C:\\FMPRO and ClarisWorks files are usually saved in C:\\CLWORKS.

You can use Windows' Program Manager to change the default sub-directory for your data files. If you do not yet have a subdirectory set up, use the File Manager to create one. Then, select the application's icon from the Program Manager and choose Properties from the File menu. Change the Working Directory to the name of an existing subdirectory on your hard disk or a network drive.

To change the default directory using Norton Desktop for Windows, select the application's icon from Norton Desktop. Choose Properties from the File menu and click the Options button. Change the Startup Directory to the name of an existing directory on your hard disk or a network drive.

IMPORTANT! If you are using ClarisWorks 3.0 and change the working directory, it becomes necessary to move your Assistant files to that working directory. To do so, go to the File Manager icon Windows and find the Claris directory in the Windows Directory. Click once on the Claris directory with your mouse (to select it), and then select Move from the File menu. Now type in the working directory location for example: D:\\USERS\\MFLYNN. Doing this will move the Claris directory and all it's files to your working directory. After you complete the move of the Claris directory, it is necessary to edit the CLARIS.INI file so that your Claris applications are aware of the Claris directory's new location.

To edit the CLARIS.INI file, select Run from the File menu (still in File Manager). In the command line box type over whatever appears and type in : CLARIS.INI and click on the OK button. Notepad will open and you will see the CLARIS.INI file. Scroll down to the section labeled [CLARIS]. In this section find the line that says: Claris Directory = C:\\WINDOWS\\CLARIS. Highlight with your mouse C:\\WINDOWS\\CLARIS and type in your new working directory, ex: Claris Directory = D:\\USERS\\MFLYNN\\CLARIS. Now your Claris applications will have a pointer to the proper location of the Claris directory, and all you assistants will be found when they are called for.

Claris Resolve: WYSIWYG Menus Fonts Issue

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.

WYSIWYG Menus is part of the Now Utilities 4.0 package. It is a control panel extension which shows fonts in their native typeface in the font menu of applications. The Claris Resolve font menu remains in Chicago 12. There are no problems with system instability.

FileMaker Pro: Target Application Incorrect in Apple Event Command

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
[NOTE: It is recommended that you have the following versions of software: System 7.1.1 or System 7.5; AppleScript 1.1]

AppleScripting Level: Beginner

Q. I set up a script in FileMaker Pro 2.0 which has a "Send Apple Event" command. After choosing the Target Application, the wrong version of the application shows up as a parameter of the command.

A. FileMaker Pro 2.0 sends an Apple event to the Finder. The Finder chooses the correct application based on:

Type = 'APPL'
Creator = <the four-character code of the application chosen by the user>
Creation Date = <the most recently created application>

The third item in that list is what throws off the selection of the Target Application. Basically, no matter which version of an application you choose, the Finder decides which one to actually send the Apple event to based on which version on your hard drive is the most recent.

Solution: if you absolutely need to have the Apple event sent to an earlier version of a specific application (HyperCard 2.1 versus HyperCard Player is a good example), the only way to get around this is to remove the more recent version(s) from your hard drive before the Apple event is sent. Moving the more recent version to a floppy disk, even if the floppy disk is in the drive, allows the Finder to choose your originally selected version.

Corollary: if you choose an application on a floppy disk to be the Target Application, the application which the Finder will actually select is the most recent version located on your hard drive (even if the version on the floppy disk is more recent).

In practice: it seems unlikely that this situation will present itself often. It will most likely occur for HyperCard stack developers who have the Player on their drives and happen to set up a FM script like this (the HyperCard Player's creation date is more recent than HyperCard 2.1).

Corollary #2: Moving the more recent version of an application to another local hard drive other than the boot volume will not solve the issue.

Claris CAD: How to print 60% Reduction to LaserWriter Pro

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
Issue: Printing reduced from Claris CAD 2.0v3 to a LaserWriter Pro. If you set the reduction in Page Setup to anything less than 60%, when you click OK to exit Page Setup, you'll get an 'out of range' error message. Whatever number you had entered as a reduction percentage will be changed to 60%. (This problem has been reported for MacDraw Pro and MacDraw II also).

Workaround #1: Move or delete the LaserWriter Preferences file from the Preferences folder inside the System Folder. You can then successfully print from Claris CAD reduced at <60%.

Workaround #2: In the Chooser, click the LaserWriter icon, then select any LaserWriter except the LaserWriter Pro printer (a LaserWriter NT or IIf, for example). Click the Setup button. You can then successfully print from Claris CAD reduced at <60%.

MacDraw Pro: Command-Option-C does not Copy QuickTime Frame

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.

Command-Option-C is a keyboard shortcut to copy the current frame of a QuickTime movie to the clipboard (MacDraw Pro 1.5v1/v2). This command works with System 7.0x, but does not work with System 7.1.

The workaround: while holding down the Option key, select Copy from the Edit menu. The movie frame will be successfully copied to the clipboard.

Claris Impact: Scale Selection Does Appear to Scale Arrowheads

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.

When using the Scale Selection command on arrows, arrowheads may not appear to scale. This is true even if the Scale Pen Widths option is selected.

Arrowheads do scale they just do not scale to the degree you may expect. Try this test:

1. Create an arrow with a large arrowhead.
2. Duplicate the arrow.
3. Resize one of the arrows and compare the size of the two arrowheads.

MacDraw Pro: Use Paint Tools to Enhance your Illustrations

Five ways you can use BrushStrokes to enhance a MacDraw Pro image.

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.

With BrushStrokes, the color paint program from Claris Clear Choice, you now have some powerful supplements to the illustration tools in MacDraw Pro. As an object drawing program, MacDraw Pro offers more flexibility with some kinds of work than paint programs. For instance, paint programs don't let you edit text once it has been placed. But once you've finished an illustration, you can use BrushStrokes to add effects like translucent paint, perspective effects, and blursÑeffects that aren't possible in object-oriented programs. When you use the two programs together, you benefit from the best of both worlds. HereÕs a few tips that will make it easy.

Start your drawing with MacDraw Pro.
When you use MacDraw Pro for the initial design of your work, you can easily reshape and move objects after they've been drawn. They behave as if you had cut pieces from construction paper. You can also edit text after it has been placed. Figure 1 shows an illustration in progress, as you might brainstorm with different concepts.

Use a screen shot to capture gradients and special text effects.
You can exchange drawings between MacDraw Pro and BrushStrokes by saving your work as PICT. But limitations in the PICT format mean that some information, such as richly detailed gradients, kerning and tracking values, and line spacing, wonÕt make it through. Since you won't be working with object information anywayÑpaint programs work on a pixel-by-pixel basis -- it's often better to take a screen shot of your work instead. In System 7, you press Command-Shift-3 any time you want to take a snapshot of the screen. This creates a file named 'Picture 1' that you can open with BrushStrokes. You now will get exactly what you see on the screen in MacDraw Pro.

Add depth.
You can make your drawing look more realistic by adding perspective. To apply the effect, you select part of the drawing, then choose Perspective from the Transform menu. BrushStrokes places handles around the selection that you can move to create the perspective effect, as in Figure 2.

Create an 'out of focus' look.
When you use a camera to take snapshots, objects in the foreground and background sometimes look out of focus. Making part of your drawing blurry can add to the perspective effect you're trying to achieve. Just select a part of your drawing, then choose Smooth from the Selection menu. BrushStrokes makes that part of the drawing look fuzzy.

Shrinkwrap it.
BrushStrokes can apply translucent tints-paint that lets part of the underlying image show through. That's terrific for shadows, lighting effects, and windows. To activate the effect, choose Translucent Images from the Options menu, placing a check mark next to it. Now, part of the background will show through new objects you draw. (You control how much shows through with the Translucency command in the Options menu.) Figure 4 shows how the translucent paint effect was used to make it look like the toy is being viewed through a clear cellophane pane, with some glare from surrounding lighting. With translucent images active, draw a few polygons over the image. Set the fore color to gray if you want the cellophane to be clear. Setting the fore color to pink, green, etc., will make it look like the cellophane is tinted. Figure 3 shows the completed project. Only three BrushStrokes commands were used to create the effect.

ClarisWorks: How to Use your AppleWorks Files

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
ClarisWorks was designed to make it easy for you to use information from other programs, including AppleWorks and AppleWorks GS. Most documents appear on your ClarisWorks screen much as they did in AppleWorks, with all formatting and formulas intact. Once converted, you can use ClarisWorks to make whatever changes you want.

You follow two basic steps to use your AppleWorks files with ClarisWorks:

1. Transfer the file from the Apple II disk to your Macintosh disk.

2. Translate the file into ClarisWorks format.

Transferring the File
There are several methods you can use to copy the data from Apple II diskettes to your Macintosh. Here are three of the most popular:

Apple File Exchange
Apple File Exchange is a utility that came with your Macintosh. It controls your Macintosh floppy drive in a way that lets it read 3.5-inch floppy disks from other computers.

AppleTalk Networks
Many schools have networks set up to share printers, files, and other resources. If you have a network, you just save your work on an AppleShare file server. Any Macintosh can connect to that server and copy the file to its own hard disk.

Macintosh LC with the IIe Emulation Card
The emulation card comes with software that lets your Macintosh read Apple II diskettes directly, as if they were Macintosh disks. You just insert your Apple II disk and drag the AppleWorks files to your hard disk.

Translating the File
Once the Apple II files are stored on the Macintosh hard disk, you can read them with ClarisWorks. But you can't just double-click them. Your Macintosh will try to look for ÒAppleWorksÓ on your computer. It probably won't find it and you'll get a message similar to, The file could not be opened, because the application program that created it could not be found.

Instead you open the files from within ClarisWorks, using the Open command and the Import Options.

After you translate your file, you'll want to take a couple moments 'cleaning up' the document so it makes the best use of your fonts and other formatting capabilities in ClarisWorks.

A Sample Conversion Session
If you open your hard disk and create a folder called 'From Apple II,' your converted files will be easier to find.

Part One: Transfer the Data
1. Open up Apple File Exchange. The contents of your Macintosh hard disk will appear on the left. (You might need to copy Apple File Exchange from one of the System Software disks that came with your computer. System 7 users can find it on the 'Tidbits' disk. If you are using System 7.5 please call Apple Customer Assistance for a copy of Apple File Exchange)

2. Insert your AppleWorks data disk into a drive. You'll see the contents of the disk appear on the right-hand list. New menu options will appear at the top of the screen.

3. Check the 'ProDOS to Mac' menu. If there is a choice for 'AppleWorks to Microsoft Works,' remove the check mark next to that option, or the files will not convert properly.

4. If you made a folder called 'From Apple II' on your hard disk, find it in the list on the left and open it.

5. For each file you want to convert, click on the name of the file, then click 'Translate.' In figure CW-1, the AppleWorks spreadsheet file 'HOME.BUDGET' is about to be copied to the Mac hard disk.

A progress bar will appear to let you know how the transfer is progressing. When you've converted all the files you want, you can quit Apple File Exchange. Your Apple II disk will automatically eject from the computer.

Part Two: Translate the Data
You open up your AppleWorks files from within ClarisWorks (remember, you can't double-click them from the desktop yet).

1. Launch ClarisWorks. Since you don't want to create a new document, click 'Cancel.'

2. Select 'Open' from the File menu.

3. Click on the Import Options lever. You'll see the screen in figure CW-2. ClarisWorks needs to know how you want to use files you import. For instance, if you're opening an AppleWorks spreadsheet file, you should click the 'spreadsheet' button.

4. If you set up the 'From Apple II' folder, find it in the list and open it (System 7 users can click the 'Desktop' button to make it easier to find this folder).

When you open the 'From Apple II' folder, you should see all the AppleWorks spreadsheet files you translated. To see other kinds of files, click the other radio buttons.

5. Select one of the Apple II files you transferred and click 'Open.'

ClarisWorks begins reading the file and making the internal changes needed to use the file with ClarisWorks. When it's done, the file will appear on your screen as 'HOME BUDGET (converted)' and you can work with it just like any other ClarisWorks file after you save it. You can even double-click it from the Mac desktop.

Translating AppleWorks GS Files
ClarisWorks can read AppleWorks word processor, database, and spreadsheet files. It can also read AppleWorks GS (AWGS) word processor files directly. But AWGS spreadsheet and database files must be saved as text before ClarisWorks can read them. Unfortunately, AWGS graphics, communication, and page layout files cannot be easily transferred.

Here are a couple tips for handling files that aren't directly supported by ClarisWorks:

* To preserve formulas in your spreadsheet, turn on the option for 'View Formulas' in AWGS. When you save as text, the formulas, and not the

results, will be saved. ClarisWorks will see the formulas and convert them.

* Your AWGS graphics documents can be translated with help from another program. Save them in APF (Apple Preferred Format). Then use an Apple IIGS utility called 'SuperConvert' to change them into 'TIFF' format. You can transfer TIFF files to the Macintosh and use the Insert command to add them to your document. [SuperConvert!, by Seven Hills software, is available from Quality Computers (800) 443-6697.]

Claris Applications: Numeric Formatting not Appearing Correctly

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
System 7.1 has a new control panel called Numbers that allows you to set up default characters for Currency Symbols ($ or ´ or £), and default locations and separators for the currency that you have chosen.

It is possible to set these symbols to anything, including words or numbers. As a result, some numeric formatting may not appear as you would expect it to.

System 7.1 also has a new Control Panel called Date & Time that controls default settings for dates and times. There is not as much control as with the Numbers Control Panel but you can change the appearance of dates and times. For example, one option allows times to appear with leading zero.
Published Date: Feb 18, 2012

How to Clean Boot a DOS / Windows Machine

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
Often times, network initialization files, memory managers, and other "terminate and stay resident" (TSR) programs conflict with Windows or Windows applications.

If you are getting errors, you should do a clean boot to trouble-shoot a possible conflict. If everything works properly after a clean boot, that indicates that something in your AUTOEXEC.BAT or CONFIG.SYS conflicts with either Windows or your application. You should restore lines from your original AUTOEXEC.BAT and CONFIG.SYS files to the AUTOEXEC.BAT and CONFIG.SYS files on your bootable floppy disk one at a time until you can re-create the original error. When you identify which file causes the conflict, either remove it from your system entirely or find out if there is a new version that is compatible with your Windows software. Note: the following is for Microsoft Windows version 3.1 and later. If you are running Windows previous to 3.1, it is recommended that you update to the newer version. This information also does not take into account other underlying operating systems besides Microsoft DOS, such as IBM OS/2.

1. Format a PREVIOUSLY UNUSED, UNFORMATTED, BLANK disk as a System disk from File Manager or use one of the commands below from the DOS prompt if you're using DOS 5.0. Otherwise, see your DOS manual for instructions.

3.5" high density disk: FORMAT A: /S /F:1.44
3.5" double density disk: FORMAT A: /S /F:720
5.25" high density disk: FORMAT A: /S /F:1.2
5.25" double density disk: FORMAT A: /S /F:360

* You must use the /s option to create a bootable system disk.
* Substitute b: for a: if appropriate.

2. Create a "TEMP" subdirectory on your hard disk if you do not already have one, either by typing "MD TEMP" at the DOS prompt or selecting "Create Directory" from the File menu in the File Manager. Name the subdirectory C:\\TEMP

3. Create an AUTOEXEC.BAT file on this new disk:

Path = C:\\;C:\\DOS;C:\\Windows
Prompt PG
SET TEMP=C:\\TEMP

4. Create a CONFIG.SYS on this new system disk:

Device = C:\\Windows\\HiMem.SYS (Type c:\\dos\\himem.sys if using Windows 3.0)
DOS = High
Files = 50
buffers=30
STACKS=9,256

SHELL=C:\\DOS\\COMMAND.COM C:\\DOS /E:1024 /P

5. Make sure the new system disk is in A:. Press and hold down the CTRL-ALT-DEL keys. When you get the "A:\\>" DOS prompt, you have now done a clean DOS level boot.

Run Windows by typing WIN at the DOS prompt and see if the DOS level clean boot solved your problem. If not, it may be necessary to do a clean start of Windows by creating a minimal configuration of the two text files Windows uses for system configuration. These two files are the WIN.INI and SYSTEM.INI. If you are running Windows for Workgroups there is an additional configuration file called PROTOCOL.INI. All of these text files with the INI extension are in the Windows directory.

1. Before editing the INI files, try starting Windows in Standard mode instead of 386-Enhanced mode by typing WIN /S at the DOS prompt. This disables the XXX.386 drivers from the system.ini file. Note: this is not possible in Windows for Workgroups 3.11, which only runs in 386 enhanced mode.

2. When you start Windows, all applications with an icon in the StartUp group will run automatically. If you want to boot without running any of the applications in your StartUp group, you can hold down the [Shift] key while Windows starts. When you do, Windows will load, but your StartUp applications won't.

Note that the StartUp group is independent of the

LOAD=

and

RUN=

lines in the WIN.INI file.

If you wish, you can disable the StartUp group by placing the line

STARTUP=

in the [Settings] area of the PROGMAN.INI file. When you leave the entry blank, as shown above, items in the StartUp group won't run.

For more information and for help troubleshooting General Protection Faults, please read Microsoft's Application Note, Troubleshooting GP Faults, #WW0524. This note can be obtained by calling Microsoft Product Support Services Fast Tips service at (206) 637-7098; by searching the Software/Data Library on the word WW0524; or from Microsoft's download service, (206) 936-6735.

ClarisWorks: Can‘t Edit Text Object in Word Processor

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
Situation: You have a text object on a Word Processing document that you can select but cannot edit.

Solution: Select the text object and choose Move to Front from the Arrange menu.

Since the typing area of a ClarisWorks word processor is essentially a text frame, if you send a text object backward, you actually are putting it behind the typing area. This makes it selectable by the arrow tool, but not editable with the text tool. Selecting the object and bringing it to the front will make it editable.

ClarisWorks: Color Graphic in Read Me File Prints in B&W

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
The Read Me file included with ClarisWorks has a graphic at the top that looks like the ClarisWorks Application icon (a red box containing several tools representing the different modules in ClarisWorks) as well as several other red graphics used as bullets (they look like splashes of paint).

The graphic at the top of the Read Me file is a bitmap while the bullets are PICT graphics. Since ClarisWorks cannot print bitmaps to an ImageWriter in color, the graphic at the top prints in black and the bullets print in color. On the other hand, a color DeskWriter will print both graphics in color as they appear on the screen.

ClarisWorks: AppleWorks File Transfer

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
Question: Can you give me some details about the way ClarisWorks writes AppleWorks format files? I have problems reading them into my Apple IIGS. I examined the file with a ProDOS disk utility and it doesn't look quite like other AppleWorks files, as if the file type is wrong, or there is a resource fork.

Answer: This probably has more to do with the way the file was "transferred" than with the way ClarisWorks "translated" the format. Here's the distinction between these two steps:

When ClarisWorks saves your work in AppleWorks format, it strips out information that can't be used, like fonts and graphics. Then it expresses the text of your file and any remaining style elements in a language AppleWorks can understand. It stamps the files with the Macintosh creator tag pdos and type tag 1A. No resource fork is used. ClarisWorks then hands the actual work of writing the file to disk to standard Macintosh file handling routines.

This is the end of the "format translation" part of getting your ClarisWorks file to AppleWorks. It's also where ClarisWorks leaves the picture. The second stage, "file transfer," is actually handled by other software.

The AppleWorks file which ClarisWorks creates can be moved to a ProDOS volume in a variety of ways:

* It could be transferred over a modem.
* It could be transferred over a network to an AppleShare file server.
* Apple File Exchange (available for downloading from AOL as part of Macintosh System 7.0.1) could copy the file to a ProDOS disk.
* The Macintosh system extension ProDOS File System could mount a ProDOS floppy on the Macintosh desktop.
* The Apple IIGS System 6 HFS FST could mount the Macintosh floppy on the IIGS desktop.

As you can see, some of the file transfer methods are so transparent, you forget how much work they are doing to reconcile two essentially incompatible disk formats.

And in practice, some of these methods are more reliable than others. Apple File Exchange, modem transfer, and AppleShare transfer seem to be virtually trouble-free. For example, AppleShare will convert the Macintosh type tag to an appropriate ProDOS file type tag automatically. The other two methods are more convenient, but they also seem to have hidden surprises.

For example, the ProDOS File System extension for Macintosh will mount ProDOS disks so they appear on the desktop and in Open/Save file dialogs. But customers report that if you try to save directly to the ProDOS disk, the file isn't transferred correctly. Instead, you must save to a Macintosh disk, then use the Finder to copy the file to the ProDOS volume.

Does this sound familiar? If it does, then you have to decide whether to keep the ProDOS file system extension and remember to transfer files at the Finder, or remove it and use another transfer method.

Changing Filetypes
If you already have files you can't read into AppleWorks and you don't have the original ClarisWorks files to try resaving, there are at least two utilities that can change filetypes on the Apple II.

1. TimeOut Filemaster will allow you to change the type from within AppleWorks.
2. Change A File, by Harold Portnoy, is a stand alone shareware program that will change file types, repair damaged AppleWorks files and more. It is available on online services.

If you have an Apple IIgs, Prosel 16, Wings, and Deliverance are 3 products that offer a feature for changing filetypes.

ClarisWorks: Spreadsheet and Text Frames

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.

In a ClarisWorks spreadsheet document, you can create spreadsheet frames on top of the spreadsheet. To do this, select the spreadsheet tool, hold down the option key (Alt key for Windows users), and click or drag out a spreadsheet frame.

The same procedure works for creating a graphic text frame in a word processing document. Select the text tool, hold down the option key, and click or drag out a frame.

HyperCard XCMD To Create Business Charts

I need to make adaptable business charts that run in conjunction with HyperCard. Any suggestions?

This article has been archived and is no longer updated by Apple.
A set of XCMDs called HyperGraph is available that can generate full-page business charts in color or black and white.

HyperGraph supports:

- Full-page display

- Color (256/16 million) with individual control for each object

- All fonts available in the System file

- 10 different types of graphs: pie, bar, horizontal bar, line, and point charts in color or black and white

- Three dimensional graph generation

- Auto-update between HyperCard and the graphics routines with HyperCard (When you modify a field under HyperCard, the graphic is updated automatically.)

- 32-Bit QuickDraw

- Screen generator to import text file and generate a HyperCard Card

For further information, send an AppleLink to "VANNIER.A".

ClarisWorks: White Text Disappears When Rotated

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.

How to reproduce the Issue:

1. Open a new graphics document.
2. Draw a square and fill it with black.
3. Type a text block and change the text color to white.
4. Select the text block with the arrow tool and change the pattern to clear.
5. Move the text block so that it is on top of the square.
6. Group the two objects.
7. Rotate the grouped object.

Objects with other text colors do not disappear. In other words, substitute step 3 with any color besides white and the text block will not disappear.

It should be noted that the white text will print to LaserWriters (PostScript) printers, even though it does not show on the screen. The white text will not print to QuickDraw printers such as the StyleWriter and DeskWriter.

The Work-around:
Substitute step 4 with any pattern other than clear. For example, if you want white text on a black background, use an opaque pattern and fill the text block with the color black.

ClarisWorks: Macros Do Not Access the Open and Save Dialogs

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.

Macros in ClarisWorks for Windows do not support access to the standard Open and Save dialog boxes. Your macros can open these dialogs but cannot record actions taken within them.

Workaround:
The above is true, however you can use the Windows Recorder accessory to record your macros instead. This does record Open and Save.

ClarisWorks: Alerts When Opening a File

When double-clicking a file to open it in ClarisWorks, one of three alerts appears on the screen:

1. "The document {filename} could not be opened, because the application program that created it could not be found" - {System 7 alert}
2. "The file {filename} could not be opened/printed (the application is busy or missing). {System 6 alert}
3. "No application is associated with this file. Choose Associate from the File menu to create an association." {Windows alert}

This article has been archived and is no longer updated by Apple.
When trying to open a file by double-clicking the icon from the Finder or File Manager, your computer tries to open the file with the "creation" application. Thus if you double-click on a MacWrite II file, the Macintosh will attempt to launch MacWrite II to open the file. If MacWrite II (or whatever the creation application is for that file) is not present, the computer cannot open a double-clicked file icon. In other words, a non-ClarisWorks file will not open in ClarisWorks by double-clicking it.

How to open a non-ClarisWorks file into ClarisWorks:

Open Method #1- Use the Open dialog box

This method is explained on pg. 2-11 of the ClarisWorks handbook or 2-15 of the Users Guide
- If ClarisWorks is not running, double-click it to run. If the New Document dialog box appears, click Cancel.
- Select Open from the File Menu
- Click the Import Options flag
- Click the correct file type to open into (e.g., Word Processor)
- Locate the file name in the scroll bar, then double-click it to open

Open Method #2 - (System 7 only) Drop-Launch the file

Drop launching is explained in the Macintosh Basics folder included with your computer.
- In the Finder, drag the file icon onto the ClarisWorks application icon (Note: that means the ClarisWorks program icon, NOT a folder icon) (Note 2: if the file and the application are in different folders, you may need to move and/or resize the windows so that the file and program icons are both visible).
The file will open into the application that it's dragged onto (in this example, ClarisWorks).

Open Method #3 - (Windows only) Setting an Association

This method is explained in the MS Windows User's Guide included with your computer.
- Click on the file in the File Manager
- Choose Associate from the File menu.
- Select the application you wish to associate the file with.
- Click the OK button.

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

Note: AppleWorks is the new name for ClarisWorks 5.0x

Microsoft Windows 3.1: Updating Printer Driver

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
Please review all READ ME and license agreements before installing printer drivers.

Obtaining and Expanding the Drivers

You can obtain updated Windows 3.1 printer drivers in one of two ways: either on floppy disk or by downloading the files from a BBS. If you download the drivers, first create a subdirectory on your hard disk called C:\\DRIVERS and download the files to this subdirectory. If you obtain the drivers on a floppy disk, create a subdirectory on your hard disk called C:\\DRIVERS and copy the files from your floppy to this subdirectory.

Microsoft distributes its drivers as compressed files within a single executable file. To decompress the drivers, run the executable file after you've copied it to the C:\\DRIVERS subdirectory on your hard disk.

For example, Microsoft ships the Universal Printer driver for the HP LaserJet III in an executable file called HPPCL5.EXE. Copy or download this file to the C:\\DRIVERS subdirectory, then change to that subdirectory and double-click on HPPCL5.EXE from Windows' File Manager or type HPPCL5 at the "C:\\DRIVERS\\>" DOS prompt. The executable file expands the drivers and supporting files into the C:\\DRIVERS subdirectory. Do NOT copy these files to the Windows or Windows\\System subdirectories.

Installing the Expanded Printer Driver

1. In the Windows Main group, choose the Control Panel icon.

2. In Control Panel, choose the Printers icon.

The Printers dialog box appears. If you have never installed a printer, the dialog box expands to display a list of printers available in the Windows version 3.1 package, and the Add button is unavailable; skip to step 4. If you are updating an existing printer, select the printer driver you want to replace and click the Remove button.

3. Click the Add button. The dialog box will expand to display the List Of Printers.

4. In the List Of Printers box, select Install Unlisted or Updated Printer.

5. Click the Install button. A dialog box appears, instructing you to insert the disk that has the printer-driver file on it.

6. Insert the disk you made during the downloading procedure, or type the path of the directory where you downloaded the driver, e.g., C:\\DRIVERS. Then click the OK button.

Another dialog box appears, listing several printers.

7. In the List Of Printers box, select the printer you want.

8. Click the OK button. The Printers dialog box appears. Your printer is listed in the Installed Printers list.

9. Click the Close button.

10. For instructions on how to configure your printer, see Chapter 5, "Control Panel," in the "Microsoft Windows User's Guide."

Updating the Microsoft Universal Printer Driver (UNIDRV.DLL)

The Microsoft Windows Driver Library includes the most current version of the Universal Printer Driver. To update UNIDRV.DLL:

1 Change to the disk or directory to which you downloaded, e.g., C:\\DRIVERS.

2 At the MS-DOS prompt, type: copy unidrv.dll <path>

where <path> is the drive and directory containing your existing unidrv.dll file. This overwrites your existing UNIDRV.DLL file.

Updating the Microsoft Postscript Driver (PSCRIPT.DRV)

The Windows Driver Library includes the most current version of the Microsoft Postscript Driver. To update PSCRIPT.DRV:

1 Change to the disk or directory to which you downloaded, e.g., C:\\DRIVERS.

2 At the MS-DOS prompt, type: copy pscript.drv <path>

where <path> is the drive and directory containing your existing pscript.drv file. This overwrites your existing PSCRIPT.DRV file.

Microsoft Windows: System Resources

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.

What are System Resources?

The system resources area is a special area of memory that Windows sets aside for graphics objects. No matter how much RAM you have installed, however, the system resources area is limited to only four 64K memory heaps in Windows 3.1. Even though there are four separate heaps in Windows 3.1, the memory allocated to one cannot be used by another if one runs out of available space. This means that if you do a lot of graphic-intensive work, you will use up the system resources very quickly, even if you have a lot of memory free. System resources include icons, window size and location, window attributes, menu and window text, line types, graphical fill patterns, brush shapes, and other reusable objects common to Windows applications.

How to find out how much you have free:

You can find out how much free memory and free System Resources you have from the Program Manager or File Manager. From either program, select "About Program Manager" or "About File Manager" from the Help menu. The heap with the lowest percentage free is reported as the amount of Free System Resources you have.

How do you free System Resources?

If you get an error message that you're low on memory or resources, the best way to free space is to exit Windows and start again. You can, however, do the following to reduce the amount of resources being used by Windows 3.1.

* Limit the number of open applications and files. Quitting from open applications frees most USER.EXEÊobjects that the application was using. However, GDI.EXE objects, such as pens and brushes, may not be freed until you exit from Windows and start again.

* Reduce the number of program groups and icons in the Program Manager or Norton Desktop. Each group takes up a fixed amount of memory, regardless of how many items are contained within a group. You may also want to consider using the File Manager as your shell instead of the Program Manager.

* Displayed icons in groups in the Program Manager use some of the System Resources. System resources are not released when the group is minimized, or if the icon is deleted during a Windows session. However, if you minimize the group or delete unnecessary icons, this memory will be freed next time you restart.

* If you have an accelerated video card, make sure that you're using the most recent video driver for your video card. Accelerated video cards virtualize system resources and vary in their ability to release system resources. Using Microsoft's VGA driver ensures the best use of the system resources.

* Disable Pointer.exe from MS Mouse v8.20a and/or screen savers such as AfterDark.

* Simplify complicated layouts in FileMaker Pro. Each object on the layout uses system resources; even the small black handles that appear in the corners of an object when you select it use system resources.

Much of this information has been obtained from articles in the Microsoft Knowledge Base. For further information about System Resources, see article Q90762, Windows: Information on System Resources in Windows 3.0 & 3.1, in the Knowledge Base, or call Microsoft Technical Support for Windows at 206/637-7098.

Mac241 Prints to ImageWriter LQ Unidirectional Only

I print from White Pine's Mac241 to an AppleTalk ImageWriter LQ and want the printer to default to bidirectional/Draft mode instead of unidirectional/Best Quality. Mac241 gives only a Page Setup box and not a Print Options box.

Is it possible to alter the AppleTalk ImageWriter LQ driver to change the default settings?

This article has been archived and is no longer updated by Apple.
If the driver was modified in this way, the software would then be unsupported.

White Pine Software confirmed that the software does not offer the user a choice of unidirectional of bidirectional.

For more information, search under: "White Pine"

ClarisWorks: Version 2.0 Notes

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
ClarisWorks 2.0 Key Enhancements:

New Capabilities
* Complete outlining feature allows users to organize their thoughts and documents using seven popular outline styles including Harvard, legal, numeric and bulleted formats.
* Presentation Slide Show with QuickTime support. you can create dynamic slide show presentations complete with background and border colors, QuickTime movies and fade between slides. Presentations can be either manual or auto-advance.
* Shortcuts offer push-button access to the 150 most frequently used commands such as spell checking, cell formatting or auto-summing. Just as with the menus, the icon palette automatically configures itself to the environment being used (e.g. text or spreadsheet).
* Full-color paint capabilities and 32 gradient fills allow users to add even more striking graphic effects to documents.
* With all these new capabilities, ClarisWorks 2.0 is still under 600K.

New Word Processing Features
* Automatic text wrap around graphics creates more professional-looking brochures, flyers, newsletters and more.
* Custom text styles allow users to create, name and save frequently-used text styles for instant access.
* Individually variable column widths. Users simply click on the column controls button to automatically add columns to their layouts; then visually adjust column size by dragging the column to the preferred width.
* Show and hide invisible characters allow users to view all format commands in their documents for accuracy.
* Expanded spell check selection. you can now spell check either their entire document or only specific blocks of text.
* Original date and time clock permanently reflect the original date and time a document was created.

Expanded Charting and Spreadsheet Capabilities
* Hi-Low-Close charts are ideal for tracking pricing trends, such as stocks, with defined beginning and end points.
* Combination charts allow users to combine chart options -- like using a line chart with a bar chart -- to illustrate contrasting data more effectively.
* Pictogram charts translate plain numeric data into compelling charts that graphically depict data.
* Unparalleled chart format customization. you can customize any or all of their charts -- change fonts, styles, adjust orientation, title and legend placement and size, select symbols, colors, scales, patterns, 3D and more.
* Spreadsheet cell wrap. When cell wrap is applied, text automatically wraps within the cell boundaries.
* Lock Title option locks column headings in place so they remain in constant view for quick reference as users scroll through documents. This also reduces the need for screen splitting.

New Database Features
* Automatic field entry from pop up menu. you can save time and avoid repetitive data entry by creating a pop up list of data. This also ensures data consistency and accuracy.
* Automatic serial numbering.
* Automatic date, time, creator, and modifier stamps.
* Automatic field validation (uniqueness, within range, emptiness).
* More than 50 pre-defined Avery label formats make it a snap to generate labels.

Graphics Enhancements
* Color paint environment includes 18 tools and six transformation effects.
* Gradient palette adds pizzazz to presentations with 16 black and white and 16 color gradients.
* Bezigon and Polygon drawing tools make it easier than ever before to create and style curves and shapes.
* Repeat Object Placement simplifies the placement of duplicate graphics by automatically placing duplicates of graphics in equidistant sequence from the original.

Communications
* Kermit file transfer protocol enables educational institutions and others that use this protocol to send files easily.
* Phone Book. you can enter all frequently used phone numbers into the Phone Book. Then, by simply selecting the name of a person they wish to contact, the phone number is automatically dialed.

System 7 Support
* Publish and Subscribe
* Apple events
* Balloon Help.

In-Package Support Materials:
* Users Guide
* Getting Started Guide with tutorial

* Quick Reference Guide
* Context-sensitive Help system
* Free America Online software and registration to access online support.

System Requirements and Compatibility:
* Macintosh Classic, LC, Plus, SE, II family or portable computers.
* Requires 2 floppy disk drives and 1 MB RAM (use of Communications module requires hard disk and 2 MB. System 7 users require 2 MB.).
* Hard disk recommended.
* System 6.0.5 or higher.

Price and Availability:
* $299 suggested retail in the U.S.
* $99 upgrade price in the U.S.
* $129 U.S. competitive trade-up through September 30, 1993.
* ClarisWorks 2.0 will be available in the U.S. in March, 1993.

Claris Products: Localization

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
European versions of Claris products use Network serialization (this serial number has nothing to do with the Registration number).

If the same copy is on two different machines in the network then only one can be launched at a time. Attempting to launch the second will give an error message saying that the maximum number of users of this application has been exceeded.

Claris also offers a Concurrent User License (CUL), which does allow the same copy to be launched multiple times but counts the number of launches and when a preset limit is reached it will disallow and further attempts to launch.

FileMaker Pro: Portions of Font or Script Menu not Visible

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.

Unlike the Macintosh, which scrolls long menus, Windows 3.x wraps long menus in several columns. Claris decided to maintain a consistent interface between the Mac and Windows versions of FileMaker Pro by sticking with menu arrangement for the Scripts menu and the Font list on the Format menu. Pop-up menus with long value lists can also run into the problem. If you have a large number of fonts, long value lists, or a large number of scripts, it is possible that some of the entries will not show up on the screen. This is because once Windows fills up the screen with its menus, it provides no way to scroll to parts of the menu that are not visible.

One workaround for this operating system limitation is to increase the resolution of your Windows video driver (if your video card can support a higher resolution). Here are some other fixes for the three situations the long menu problem can appear: the Font selection of the Format menu, long pop-up menus, and the Scripts menu.

1. Font list on Format Menu

If you are using FileMaker Pro version 2.0, you can change fonts by using the Text Format selection on the Format menu. FileMaker Pro 2.1 added a feature that allows you to configure the Font list on the Format menu to show just the fonts you choose, and therefore not fill up the screen with multiple columns. The Configure/More Fonts option in the Format menu allows you to remove fonts from the Font list on the Format menu, without having to remove fonts from your system. A Configure/More Fonts selection appears at the top of the list of fonts when you choose Font from the Format menu, and this Configure selection lets you pick and choose which fonts you wish to appear in the font list. You can still use any available Windows font by using the Text Format selection on the Format menu to change the font on a selected field or text object on a layout.

If you have a lot of fonts installed, however, you may not even be able to access the Configure/More Fonts option with a mouse, and you do accidentally change fonts when you don't mean to.

The best way to access this is to not use the mouse, but to use command keys, instead:

ALT-T [formaT menu]
F [Font]
F [configure/more Fonts...]

Remove fonts from the menu until you have a manageable number. You can use the mouse for this. Note that you can still access fonts that you remove from the font menu by selecting the text object or field you want to format, then using Apply Font from the Configure/More Fonts... dialog box.

Another good trick with Windows is not to keep the mouse button held down when selecting from menus. To get to the Text Color option, for example, click once on the Format menu and then let go of the mouse button. If you then click on Text Color, for instance, thus "jumping over" everything in between, you can avoid the problem of the long font list drawing on the screen.

2. Long Value Lists Formatted To Show As Pop-up Menus

If you have long value lists and format them to appear on the layout as pop-up menus, consider formatting the field to show the value list as a pop-up list instead. This will only show a few items from the value list at one time and provide a scroll bar so that you can scroll through the items in the value list.

3. Long Scripts Menu

If your scripts menu is causing the difficulty, you can either shorten the names of some scripts, so you can show more columns, or remove some of the scripts from the menu by de-selecting the "Include in menu" checkbox. Scripts that are removed from the menu can be accessed from buttons, other scripts, or by performing the script from the ScriptMaker dialog box. As with the Font selection on the Format menu, sometimes so many columns appear that the ScriptMaker selection can not be chosen from the Scripts menu. In that case, you can still choose ScriptMaker with its key combination:

Alt - C Brings down Scripts menu (While holding down the Alt key, press C)
S Chooses ScriptMaker from the Scripts menu that was brought down with Alt - C

MacDraw Pro: How to Print a Color Palette

Listed below are the steps for printing a Color Palette.
This article has been archived and is no longer updated by Apple.
To print a palette:

1. Display the desired pallet on an Untitled screen. View by color is suggested
2. Take a screen shot using Command-Shift 3
3. Open up the resulting picture in MacDraw or TeachText (System 7)
4. Print the document

ClarisWorks: Decreased Performance of High-speed Serial Communications

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
The Macintosh Hardware System Update 1.0 is an extension which fixes errors in System 7.1 which result in decreased performance of high-speed serial communications in Classic II, LC, LC II, IIsi, IIvx, IIvi, Quadra 900, Quadra 950. Inaccuracies in the system clock were also fixed for that set of CPUs.

If you have one of the CPUs above, run System 7.1, and use the ClarisWorks communications environment, we recommend you obtain this extension.

In addition, the Hardware System Update 1.0 fixes:

* errors in ejecting floppy disks in IIsi, IIci, IIvx, IIvi, Quadra 700, Quadra 950;
* includes a new version of the Memory Control Panel which prevents users from setting RAM disk sizes to inappropriate values.

The extension is free from user groups and on-line software archives.

ClarisWorks: Week of Year Based on Fiscal Year

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
Let's say you would like to know what week of the year a certain date falls on. FileMaker Pro and ClarisWorks both have a WeekofYear function which returns the number of weeks from January 1 based on a supplied date. If you want to calculate the number of weeks starting at a date other than January 1, as in a fiscal year beginning date, you can use the following calculation given your file contains the field ProjectDate:

Week of Year (calculation, number result) = INT ((ProjectDate - Date (3,1,Year (ProjectDate)))/7)+1

The Date function is where the start date is formed. In this example, the start date is 3/1 of the year of the ProjectDate.

Calculating radians for degrees including the units for minutes and seconds
The Radians function in ClarisWorks spreadsheet documents converts an angle measurement given in degrees into radians, the standard unit used in trigonometric functions. This function has one argument, or variable, which is the number of degrees and fractions of a degree expressed as a decimal number. If your angle measurements are expressed in degrees, minutes, and seconds you must convert these numbers to a single decimal number within your formula in order to convert it to radians.

The following formula will do this. It assumes the degrees are in column B, the minutes in column C, the seconds in column D, and that you want to calculate the radians in column E:

E1 = RADIANS (B1 + (C1/60) + (D1/3600))

Claris Applications: Envelope Settings for DeskWriter and StyleWriter

Helpful hints for printing envelopes on a DeskWriter or StyleWriter

Note: This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Knowledge Base.

This article has been archived and is no longer updated by Apple.
The following table shows the correct margin settings for printing envelopes. For DeskWriters, be sure to select Envelope Media in the page set up dialog, and modify the document margins to the values shown in the table.

Printer (Driver Ver.)	Top Margin	Bottom	Left	Right
DeskWriter (3.1	0	.57	.25	.25
DeskWriter C (2.0)	.17	.57	.25	.25
DeskWriter 550C (1.0)	.13	.13	.75	.31
DeskWriter 560C (5.0)	.125	.125	.75	.306
StyleWriter (7.1.2)	.28	.30	.68	.84
StyleWriter II (1.0)	.28	.50	.75	.75

After setting your document margins, use Text Frames in MacWrite Pro or ClarisWorks to position your return and mailing addresses (for an example, see the Envelope document in the Samples folder).

Envelope feeding in the DeskWriters
The original DeskWriter and the DeskWriter C accept envelopes one at a time. The envelopes are fed in top first. Page Setup is set to portrait when printing envelopes.

The DeskWriter 550C and 560C accept multiple envelopes. The envelopes are fed sideways so that the top of the envelope is the left printing side of the printed page. Page Setup is set to landscape when printing envelopes.

Envelope feeding in the StyleWriter
StyleWriter I printers accept envelopes top edge first, one at a time via a manual feed. Page Setup is set to portrait when printing envelopes.
StyleWriter II printers accept envelopes sideways, and you must press the lever to the envelope setting.

Note: StyleWriter ink is water soluble, can smear and become unreadable if it gets wet. Do not print envelopes on the StyleWriter if there is any possiblity of the envelope getting wet.

ClarisWorks: Blank Spreadsheet Pages Being Printed

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
ClarisWorks only prints cells which contain data by default. However, it will print pages for blank cells when you apply a format to an entire row.
To duplicate this issue:

1. Select an entire row by clicking on the row header.
2. Apply a format (either a font change or a numeric format).
3. Enter some data in the first few columns.
4. Print (the default Print Range is "cells with data")

Several pages of blank spreadsheet grids will be printed out.

Formatting an entire column does not produce this problem.

If you need to apply a row format, select the cell range rather than clicking the row header. Another option is to select a cell range to print and choose Print Range from the Options menu.
Published Date: Feb 18, 2012

ClarisWorks: Charting Non-Adjacent Rows or Columns

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
ClarisImpact and ClarisWorks do not include a built-in feature to chart non-adjacent rows or columns in a Spreadsheet or Table. A data chart can only include a single contiguous range of cells.

There are two workarounds for this:

The best workaround in to use another blank area of the spreadsheet or table to contain the adjacent rows or columns that you want. For example, say you want to chart numbers in columns B, D, and F, starting with row number 2:

NOTE: ClarisImpact tables do not automatically show row or column headings. To show headings, select TABLE OPTIONS from the TABLE Menu and check Column Headings and Row Headings.

1. Create a spreadsheet or table.
-In Claris Works, this is done by selecting FILE and NEW, then selecting the Spreadsheet Option.
-In ClarisImpact, click once on the Table tool, then drag the Table onto your layout.
2. Select some unused columns to the right; for example, column AA.
3. In cell AA2, enter the formula =B2Ó (no quotes). Cell AA2 will contain the value from cell B2. In cell AB2, enter the formula D2. In cell AC2, enter the formula =F2.
4. Use the Fill Down command in columns AA..AC to fill down from row 2 to the last row to be charted. The contents of columns B, D and F are copied into columns AA..AC, which are adjacent.
5. Chart these adjacent rows.

An easier but less complete workaround is to chart the original range of cells (here, columns B through F), then change the series in the chart to transparent. To do so, select a series item in the chart legend that you donÕt want charted (for example, the series for column C), then change the pen and fill patterns to transparent [note: the Toolbar will appear above your Table in ClarisImpact.

If the tools are not available in a ClarisWorks Spreadsheet, select SHOW TOOLS from the VIEW menu]. The bar or line in the chart for that series will change to transparent; however, the space for that chart item will remain, and the series names will still be listed in the legend. There is no way to make these series names not display, but you can draw white rectangles over these unwanted series names to mask them.

ClarisWorks: Alternate for Enter Key

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
Control-C (not Command-C) performs the same as the Enter key on a Macintosh

The Enter key is used for such actions as:
- Entering a record in FileMaker or ClarisWorks
- In ClarisWorks, changing from editing a text object to selecting it, so you can move or resize it. (Just like clicking on the selection arrow tool in the tool bar).
- In ClarisImpact, when entering data into a Table and you want to accept a cell entry.

ClarisWorks: Can‘t open Text file by Double-Clicking

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
Plain text files saved from ClarisWorks 2.0 are saved as MacWrite 5.0 text files (the file Type attribute is MACA). Therefore, if you save from ClarisWorks 2.0 as a plain text file, then try to reopen it into ClarisWorks by double-clicking the text file icon, you'll see an alert that says "The document XXX could not be opened because the document that created it could not be found."

To open the file:
1- Use the Open command in the ClarisWorks File Menu (Be sure to choose "Word Processing" as the Document Type in the "Open" dialog box), or
2- Drop-launch the file icon onto the ClarisWorks application icon (drag the icon onto the ClarisWorks application icon {not a folder icon}, then release the mouse button).

ClarisWorks: Can‘t Select Entire Spreadsheet By Clicking

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
In ClarisWorks you can hide rows and columns in the spreadsheet by clicking on the border of a row or column header and dragging to collapse it.

However, if you hide the first row or column, you cannot click on the intersection between the row and column headers to select the entire spreadsheet. If you click on the intersection, you will get the resize pointer, which will allow you to resize the rows or columns which have been reduced to zero.

To select the whole sheet, you must use Select All from the Edit Menu and select Row Height or Column Width from the Format menu to restore the spreadsheet to its default column widths or row heights.

Tip: When you collapse the first few rows or columns, first resize Row 1 or Column A, leaving just a little space so it isn't collapsed all the way. This will prevent the selection problem.

ClarisWorks: Hiding Spreadsheet Cells

Spreadsheet rows and columns can be reduced to a row height of zero to hide the cells.

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
Spreadsheet rows and columns In ClarisWorks and Table rows and columns in ClarisImpact can be reduced to a row height of zero, thus hiding the cells. For example, you might want to have data in your spreadsheet which is used for calculations but which should not print, and you don't want to use the Print Range command (you wish to print a discontiguous range). To reduce the spreadsheet row height or column width to zero, select the desired rows and either 1) drag the divider between two selected rows up above the next divider or 2) choose Row Height or Column Width from the Format Menu (Table menu in ClarisImpact) and type "0" into the size field.

To restore your spreadsheet to its original appearance, choose Select All from the Edit menu and check the "Default" box in the Row Height and Column Width dialogs. This will display all cells at their default 14 pt. height and 1" width.

PMMU Adds Clock Cycle to Memory Access

Is there any reason that a Macintosh II with 8MB of RAM would slow down with a PMMU installed? My Macintosh II seems to be slower with the PMMU.

This article has been archived and is no longer updated by Apple.

Installing a Paged Memory Management Unit (PMMU) in a Macintosh II should not cause it to operate slower than a Macintosh II with the original Address Management Unit* (AMU) installed. Each device adds a clock cycle to memory access and, therefore, requires a second wait state.

The 68030 processor used in other members of the Macintosh II family has the equivalent of a PMMU built-in, and thus does not require the extra clock cycle for memory access. This allows a 68030-based Macintosh to run approximately 8 to 10% faster than a Macintosh II.

* Also known as the Hochsprung Memory Management Unit (HMMU), named after its designer, Ron Hochsprung.

Claris: Translating Microsoft Word Documents With Tables

Three ways to get a table from a Word document into a Claris application's document properly formatted.

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
When opening a Microsoft Word document with a table (using the Open, Insert, or Place File commands), each cell is placed on a separate line, with an extra return at the end of each row. For example, this table:

cell 1 cell 2
cell 3 cell 4

will be converted to this in the document in MacWrite, ClarisWorks or MacDraw Pro:

cell 1
cell 2

cell 3
cell 4

There are three ways to get a table from a Word document into a Claris application's document properly formatted:

Note: These methods work with Microsoft Word 5.1. If using Microsoft Word 5.0 or earlier, table data is not copied to the clipboard as tab-delimited text; the data is copied in a return delimited format as shown above. Thus, upgrade to Word 5.1 or try solution #2 below.

Solution #1: Copy and Paste
1. Open the document in Microsoft Word.
2. Select the document, including the table(s). Choose Copy.
3. Switch to a new or existing document in your Claris application. Choose Paste. The table data is pasted in as regular tab separated text.
4. Select the table data, then set tabs in the ruler to properly align the columns.

Solution #2: Convert Table to Text in Word
1. You can convert the table in Microsoft Word to regular tab-separated text. Once converted, you can copy/paste into a Claris applicationÕs document. For instructions, go to Microsoft WordÕs online help; scroll down to the Tables topic; select the subtopic 'Converting a Table to Text.'
2. After converting the table to text, set tabs in the ruler to align each column. Then copy/paste the document to the Claris applicationÕs document.
Note: to preserve the original Word document with tables, either close the Word document without saving, or Save As with a different file name.

Solution #3: Converting the Word Table to a Claris application's Table
Select the entire table in Word and Copy. Then switch to the Claris application and paste. Select the data you pasted and in:

MacWrite Pro: Choose Insert Table from the Frame menu.
ClarisWorks 2.0: Show the Shortcuts Pallete and click the Make Table button.
ClarisWorks 1.0: Create a spreadsheet frame and paste. Resize the frame as needed.
ClarisImpact 1.0: Create a Table Model and paste. Resize Model as needed.

Solution #4: Using Find/Change in the Claris Application to Reformat the Table Data
If you don't have the Microsoft Word application, and thus can't open the original Word document:
1. Open the Word document in the Claris application. Select the table data, then Cut. Open a new document, then Paste the table data into the new document. Then follow the instructions below:

In MacWrite Pro:
2. Choose Find/Change from the Edit menu.
3. Type Command-Return twice. This will enter \¦\¦ into the Find field.
4. Tab to the Change field and type XXXX (or anything else thatÕs unique to this document).
5. Click the Change All button.
6. Choose Find/Change again from the Edit menu.
7. Type Command-Return. This will enter \¦ into the Find field.
8. Tab to the Change field and type Command-Tab.
9. Click the Change All button.
10. Choose Find/Change again from the Edit menu.
11. Type XXXX.
12. Tab to the Change field and type Command-Return.
13. Click the Change All button.

14. Select all the data, Copy and Paste into other the document you Cut it from in step #1. Choose Insert Table from the Frame menu, and press OK.

In ClarisWorks 2.0:
2. Choose Find/Change from the Edit menu.
3. Type \\p\\p into the Find field.
4. Tab to the Change field and type XXXX (or anything else thatÕs unique to this document).
5. Click Find Next and then click the Change All button.
6. Choose Find/Change again from the Edit menu.
7. Type \\p into the Find field.
8. Tab to the Change field and type \\t
9. Click Find Next and then click the Change All button.
10. Choose Find/Change again from the Edit menu.
11. Type XXXX.
12. Tab to the Change field and type \\p
13. Click Find Next and then click the Change All button.
14. Show the Shortcuts pallete and click the Make Table shortcut.

ClarisWorks: "This is a ClarisWorks 1.0 document" Alert

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
Problem: When opening a new document in ClarisWorks 2.0, you may see this alert:

This is a ClarisWorks 1.0 document. A copy will be opened in 2.0 format and "[v2.0]" will be added to the filename." This is acutally normal the first time a 1.0 document is opened with 2.0. However, if you are seeing the same dialog repeatedly on opening the same document read on.

Solution: You have an automatic stationery file in your Claris folder that was created using ClarisWorks 1.0. Whenever you open a new document in version 2.0, ClarisWorks is opening and converting this file.

(An automatic stationery file is a stationery file named "ClarisWorks WP Options", ClarisWorks SS Options", etc.)

To make this alert stop appearing whenever you open a new file:
1- Open a new document
2- From ClarisWorks 2.0, save as an automatic stationery file, replacing the existing file (see page 2-22 in the ClarisWorks 2.0 Handbook for further instructions)

- Or -

delete this file from the Claris folder on your hard drive, and create a new one in ClarisWorks 2.0.

MacDraw Pro: Selecting Objects on Multiple Slides

In Slide mode, you want to select objects on multiple slides. For example, you might want to select all the text objects, then change them to a different font.
This article has been archived and is no longer updated by Apple.
In slide mode, only the master slide and the current slide are visible. All other slides (layers) are hidden. To select objects on multiple slides:

1- Change to Layers
2- Select the Layers command. You'll see that only two layers are visible, the current and the master slide layer.
3- Show (unhide) all hidden layers:
- (MacDraw Pro) In the Layers dialog, Select All (Command-A), then click Show, then click OK.
- (MacDraw II) In the Layers dialog, click Show All, then click OK.
4- To select all text objects, click the text tool, then press Command-Shift-A
(or, turn on Multi-Layer Selection in Preferences, then press Command-A (Select All)
5- Make changes as needed
6- When done, choose Turn Slides On to return to slides mode.

ClarisWorks: Macintosh Created Footnotes May Show Overflow Symbol

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.

In ClarisWorks for Windows documents originally created in ClarisWorks for the Macintosh, a problem may occur where footnotes show the overflow symbol (a small box with an X in it) at the end of the footnote. This problem seems to happen most often when the fonts used to create the document are not available on the Windows machine.

When a font on the Macintosh is not available on a Windows machine, Windows uses Font Substitution to determine which Windows font seems similar enough to the Macintosh font. By default, Windows knows to substitute TimesNewRmn for Macintosh Times, and Arial for Macintosh Helvetica. Additional font substitutions can be added to the WIN.INI file in the Windows directory. For more information about Font Substitutions, refer to your Windows documentation.

To remove the overflow symbol from the footnote, simply select it and delete it or backspace over it.

PhoneNetTalk: Changing Directories in the Open / Save Dialogs

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
When using PhoneNetTalk to access a Macintosh file server from a PC, moving too deep into nested sub-directories (Macintosh folders) may eventually seem to stop working. Double-clicking on sub-folders, or selecting a folder and clicking the Open button from the Open or Save dialogs does not change the current working directory. This only seems to happen after at least four levels of sub-nesting of folders. Changing the current working directory in the properties of a Program Manager icon does not correct this issue.

This appears to be a problem in Windows (all versions), since similar behavior can be noticed in many other Windows applications. The only suggested workaround at this time is to not nest directories too deeply on Macintosh servers where ClarisWorks for Windows documents need to be stored.

ClarisWorks: Fill Patterns On-Screen Different Than Printout

Issues exist on the Windows platform due to a limitation of the platform -- not Claris software.

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
When printing documents that use patterns for filling-in graphic objects, or for lines, the patterns don't appear the same on printouts as they do on the screen. They appear to be solidly filled, or even shaded.

What is actually happening is the dpi (dots per inch) of the fill pattern is getting increased from 72 dpi (on-screen) to the usually higher dpi resolution of the printer. At present, all versions of Windows do not properly handle patterns of sizes other than 8x8. As a result, the pattern shrinks down as the resolution increases, causing it to look shaded or even solid when printed out.

At this time, the only workaround for this limitation is to create your objects in, or paste them into, a paint frame created within your document.

Claris Applications: Lines Not Printing to LaserWriter IIf/IIg

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.

If you notice that horizontal or vertical lines in your documents are not being printed correctly to your LaserWriter IIf or IIg, you will need to make a simple adjustment to your LaserWriter's setting. To do this you will need the LaserWriter tools disk that came with your printer.

Just follow these three steps:

1. Open the LaserWriter Utility application on the LaserWriter disk.
2. Under the Utilities Menu, choose 'Set PhotoGrade.'
3. Move the slider all the way to the left towards the 'More Levels of Gray' option.

Your printer will then been reconfigured with the proper settings.

MacDraw Pro: Returns Inside Text Objects in PICT file Missing

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.

Returns inside text objects appear to be stripped out when saved as PICT and reopened into another application. When reopened, the text objects will be the correct size.

However, if you make the text object wider, the text will reflow to fit the new bounding box, as if no returns were entered into the text object. When tested with MacDraw Pro, ClarisWorks and Canvas, the issue seems to occur going from any one program to any other. So, it doesn't seem to be an application-specific issue.

Published Date: Feb 18, 2012

ClarisWorks: Communications Troubleshooting

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
Communications issues can be divided into 3 areas: making the connection, sending/receiving text, and transferring files. These correspond to 3 commands in the Settings menu, Connection, Terminal, and File Transfer. When troubleshooting, first determine which of these 3 areas is the issue.

1. Connecting With the Modem
- Make sure you have chosen Open Connection from the Session menu.
- Make sure that the modem is plugged in and switched on.
- Check if you have the right port selected by choosing Connection from the Settings menu. Also set the baud rate at the speed of your modem.

With the BBS or Online Service
When you successfully connect with a service using the Apple Modem tool, you will get a message: "Connection established at 2400 baud" or whatever baud you connected at. Press the OK button to enter Terminal mode and begin your session. Sometimes it is necessary to press the Return key after this to trigger the host to begin sending you data.

- Successful Connection but no signs of life - Proceed to the section below entitled "Terminal."

- Unsuccessful Connection - Since the Apple Modem tool insulates you from the connection process, it can be useful to switch to the Serial Tool when having connection issues.

Using the Serial Tool to Troubleshoot
Choose Connection from the Settings menu and select the Serial Tool. Make sure the correct baud rate and port settings are selected and press OK. Open Connection and type AT. The modem should answer with OK. If there is no response, type AT&F. This resets your modem to factory settings. Once again, there should be a response of OK. If there is still no response, the modem is either not connected properly, not functioning properly, or you do not have a proper cable.

If you get an OK response from the modem, type ATDT followed by the phone number to dial. In essence, you are manually doing what the Apple Modem Tool does automatically.

You will commonly see a string of messages such as:
DIALING
RINGING
MODEM
CONNECT 2400

If you are able to connect, but still nothing else happens, even after pressing the Return key:

- Choose Connection from the Settings menu. Make sure you have the correct baud rate and other settings for your modem and the service you are calling. The 2 most common settings are:
a. parity - none, data bits - 8, stop bits - 1, handshake - none
b. parity - even, data bits - 7, stop bits - 1, handshake - none
- If the steps above fail, proceed to the section below entitled Terminal.

Apple Modem Tool and Initialization Strings
If you are able to connect with the Serial Tool and not with the Apple Modem Tool, it is likely that your modem doesn't like the initialization string the Apple Modem Tool is sending before dialing. Switch back to the Apple Modem Tool in the Connection dialog and choose Custom from the modem popup menu. If you don't see a Custom option, hold down the option key and try again (you have an older version of the Apple Modem Tool). Delete the initialization string and press OK. Try connecting using the Apple Modem Tool now.

2. Terminal
(Unless specified otherwise, all directions refer to the Terminal dialog: select Terminal from the Settings menu.)

If you are able to connect but have trouble sending or receiving data:

- If you have not already done so, make sure the baud rate and other port settings are correct for your modem and the service you are calling (Connection Settings dialog).

- Not receiving data - Verify that the On Line option is checked.

- Strange characters scattered throughout incoming data - Connection settings are probably incorrect. See above for the 2 most common settings. Also, the terminal type may be wrong. Try switching to another terminal tool. If none of this works, call the System Administrator of the service to ask for details about what settings to use.

- Unexpected characters appear or characters lost - Bad connection. Log off and call back. If the issue remains, try reducing the baud rate or changing to a different handshake method in the Connections dialog.

- What you type doesn't appear on screen - The host computer is not echoing what you are sending. Turn on Local Echo.

- Data appears as double characters - Turn off Local Echo.

- Incoming data writes over last character on the first line - Turn on Auto Wrap to Next Line.

- Incoming data writes over same line - Turn on New Line on a Return.

- Lines of incoming data are double spaced - Turn off New Line on a Return.

- Data loss when pasting - Choose Preferences from the Edit menu and set a character paste delay. If the issue seems to be at the beginning or end of a line, set a line delay. 1=1/60 of a second so start out with a number like 10.

3. File Transfer
- Not enough room to receive file - If you have enough hard disk space, the file may have corrupt header information. If the file doesn't have a resource fork (is not an application or a document with resources) switch the file transfer method to Straight XModem in the File Transfer dialog. If you have ClarisWorks 2.0 and the service supports Kermit, another option is the Kermit tool. The XModem Tool included with ClarisWorks 2.0 offers improved MacBinary handling of files which will prevent this issue from happening in the first place in many instances. For more details see the document "Out of Memory or Disk Space when Downloading Files."

- Transfer Failures - If a transfer fails, it could be due to a bad connection or phone noise. Try connecting again and when downloading the file, notice in the status dialog if there are errors in blocks being sent or received. If there are, increase the Timeout and Retry numbers in File Transfer Settings.

Text Transfer Tool
If data is lost when uploading via a Text file transfer, try slowing down the rate of transmission by increasing the Delay Per Character or Line (File Transfer dialog). You can also try using handshaking (Connection dialog).

ClarisWorks: Calculating Elapsed Time

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.

If you would like to know the number of hours elapsed between two time fields in a ClarisWorks database or spreadsheet, use the following technique.

Assuming you already have two time fields defined as follows:

StartTime (Time)
EndTime (Time)
The formula for the calculation is as follows:

ElapsedTime (Calculation, number result) = (EndTime - StartTime) * 24

In a spreadsheet, assuming the start time is in cell A2 and the end time is in B2, use the formula:

=(B2-A2)*24

ClarisWorks stores the time fields as a fraction of a day. Midnight is 0.0, 6:00 AM is 0.25, Noon is 0.5, and 6:00 PM is 0.75. When two time fields are subtracted, the result is a decimal that can be converted to hours by multiplying by 24.
Published Date: Feb 18, 2012

Macintosh II Family: Monitor Power Receptacle Power Limit

How much power can a monitor connected to the Macintosh II or Macintosh IIci monitor input receptacle consume? I know how much the AppleColor RGB monitor consumes (160W), but is it possible to have a monitor connected that consumes more power?

This article has been archived and is no longer updated by Apple.

Three amps at 110 volts (1.5 amps at 220 volts) is the maximum amount of power that can be drawn from any Macintosh II monitor power input receptacle. This means that 330 watts is the maximum wattage that can be pulled from the monitor power input receptacle.

ClarisWorks: Communications with a TDD Modem

"I want to use my computer and modem to talk with a deaf friend who has a TDD. What settings do I need to use?"

by Andy Baird, AFC of the DisAbilities forum on America Online (edited with his permission - Thanks Andy!)
This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

Note: AppleWorks is the new name for ClarisWorks 5.0x
This article has been archived and is no longer updated by Apple.
This question comes up again and again. It seems logical: why not use your computer and modem to communicate with TDDs? Trouble is, more often than not because of conflicting standards it won't work.

Most TDDs use a very old technology called Baudot (pronounced "baw DOUGH"). It has different character codes than computers and uses completely different audio tones to send signals through phone lines. Regular computer modems can't understand Baudot tones or codes, and most TDDs, especially older ones, can't understand the ASCII character codes and high speeds we use with our computers. It's a standoff.

Now, if you're lucky, your friend may have more recent, more deluxe TDDs that can communicate in ASCII as well as Baudot. If that's true, then you need to set your modem to 300 baud (the speed is important) and try 8 data bits, 1 stop bit, no parity and half--not full--duplex. You may have to try other parity settings (even or odd) to get this to work, depending on how your friend's TDD is set up.

If you friend does not have an ASCII-compatible TDD, there are a few alternatives:

1. Persuade your friend to purchase a new TDD.
2. Persuade your friend to get a computer with a modem and get on AOL or any other national bulletin board service like CompuServe, GENIE, and FIDO-net bulletin boards.
3. Buy a combination Baudot/ASCII modem.

That third option sounds good, but there's a big problem. Two problems, in fact. First, almost all of the combination Baudot/ASCII modems out there are not "Hayes compatible." That means they can't be used with standard programs (like the AOL software, or Microphone or Crosstalk) because they don't recognize standard commands to to do things like dial out. They usually come with their own special, limited-purpose software.

Problem number two: all of the combo modems, including the one that is Hayes-compatible (see below) will only go up to 300 baud in ASCII mode! Nobody in their right mind would ever try to use a 300 baud modem to log onto AOL or any other computer info service...it's about ten times too slow. So if you bought one of the Ultratec modems to talk to your friends with TDDs, you would STILL have to keep your regular high-speed modem for use with AOL. That's an expensive, complicated setup.

Bottom line: ask your friend if s/he has an ASCII-capable TDD. If s/he does, you can connect with her or him (with luck and some fiddling around). If not...consider the alternatives mentioned.

ClarisWorks: Finding the Minimum Non-Zero Value in a Range

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.

If you use the MIN function to find the lowest value in a range, any empty cell in that range will force the MIN function to return a zero. To find the minimum non-zero value in a range, you need to first create a calculation that will return either the non-zero value for each cell or a value that is higher than the non-zero minimum in the range.

Let's say you have numbers entered in A1 to A10. In B1, enter the following formula:

=IF(A1 = 0,MAX(A1..A10),A1)

Plain English: If the value in A1 is zero, return the highest value from A1 to A10; if it is not zero, return the number. Once you have entered this, select cells B1 to B10 and fill down. Now you will have a column of numbers where the zeros (or empty cells) have been replaced by the highest number in column A. Now to find the minimum non-zero value in column A use this formula:

=MIN(B1..B10)

Since there are no zero values in column B, it will return the lowest number.

Note: Instead of MAX(A1..A10), you could use any number that would be higher than the non-zero minimum, such as 10,000,000 or MAX(A1..A10) -1.

Although ClarisImpact Tables have no visible cell references this solution will still work.

ClarisWorks: Getting a Command-Key Symbol into a Document

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
In certain fonts, there are certain special characters that are accessed by holding down the Control Key along with another key. For example: Choosing the Chicago font and typing "Control q" should type the "propeller" or "daisy" symbol that appears on the Command Key.

This does not work in a ClarisWorks Word Processing or Paint document. Instead either nothing appears or the correct key is replaced by a space. If the desired keystroke is done in KeyCaps, and then copied and pasted into ClarisWorks, the result is the same.

However, typing "Control q" in Chicago font DOES work in the Spreadsheet environment.

Here is a way to get the character into a Word Processing or Paint document:

1. In a spreadsheet or a spreadsheet frame, click on a cell and set the font to Chicago.
2. Set the Size to 48 (24 if you are using an ImageWriter) and set the Row Height to 60.
3. Now in the cell, type Control Q. This gives you the quadrille character.
4. Snapshot the screen by pressing Shift-Command 3.
5. Switch over to the Finder and double click the Picture 1 file you just created.
(Under System 7, this will use TeachText to open the picture. System 6 will require a paint program.)
6. Drag a selection rectangle around only the large quadrille character, and type Command-C to Copy.
7. Now switch back to ClarisWorks and open a new Graphics document.
8. Paste. Then under Options, choose Scale Selection and set each direction's reduction to 25% (50% if you are using an ImageWriter).
9. Click on to select and then Copy the resultant graphic.
10. Now return to your original Word Processing document, and paste the quadrille in wherever you need it.

Since the quadrille or "propeller" Command symbol was created four times larger, it prints at a higher resolution.

You can Copy it into your scrapbook for use in future documents.

ClarisWorks: Rows or Columns Missing

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
In all versions of ClarisWorks, it is possible to resize the columns or rows so that they are not visible on-screen, giving the impression that the cells have been deleted. This is especially difficult to diagnose if a number of columns or rows were selected at the time that they were resized, because it might appear that column F in the spreadsheet is next to column C or that row 20 is immediately below row 10.

This is an excellent feature. You might want to have spreadsheet data which is entered into columns, but which does not print, or you might want to have spreadsheet cells collapsed so that they do not take up room on the screen when working with a large spreadsheet. Because the data entry in these cells remains intact, and because the calculations in the collapsed cells still calculate, you can have a huge amount of functionality 'hidden' in this way.

To restore the spreadsheet to its original display, you can use the Select All command and enter the Column Width dialog or the Row Height dialog and click the checkbox next to Use Default. This will restore all of the columns in the spreadsheet to their default width, but sometimes there is a lot of design work which has been invested in the display. To return only a range of cells to their original display, without changing the whole spreadsheet back to the default, you would have to select the affected range and make the appropriate adjustment.

In the example above, select columns C and F, then choose Column Width with Use Default to make columns D and E appear. Select rows 10 and 20 then choose Row Height with Use Default to make rows 11 through 19 appear.

ClarisWorks: Thesaurus Offers Inaccurate Suggestions

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.

If you do a Thesaurus lookup with a capitalized word, and Word Finder does not know the word, you can get inaccurate suggestions as to the closest matching word.

To duplicate this:
1. Launch MacWrite Pro, ClarisWorks or ClarisImpact.
2. Type and select the word 'Dum'. Capitalization is important.
3. Bring up the Thesaurus.

You get a list of suggestions beginning in the middle of the ju's and ending with 'Xerox copy' and 'Synonym finder'. If you change the word to 'dum' and do another lookup, you get a more reasonable list.

This occurs with all languages. In addition, single letters tend to give odd results. Looking up synonyms for 'b' will provide a list of close matches beginning with 'a' as well as 'b'.

Thesaurus version 3.7 is the current version as of 4/2/93 and it exhibits this problem.

ClarisWorks 2.0: ClarisWorks 1.0 Translators File

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
ClarisWorks 1.0 stores Spreadsheet and Database translators in a file called 'ClarisWorks Translators' rather than in the Claris Translators folders as with Word Processing and Graphic translators. In other words, ClarisWorks 1.0 has three items in the Claris folder within the System folder (Claris XTND System, ClarisWorks Translators, and Claris Translators folder). ClarisWorks 2.0 stores all translators as individual files in the Claris Translators folder.

Beta versions of the ClarisWorks 2.0 Installer removed the ClarisWorks Translators file. The final release of ClarisWorks 2.0 was modified so that the installer does not remove the ClarisWorks 1.0 translator file. Therefore, ClarisWorks 1.0 and 2.0 can be run concurrently without affecting translation.

If you are not running ClarisWorks 1.0 any longer (only running ClarisWorks 2.0) then trash the "ClarisWorks Translators" file and you will save approximately 100k of hard disk space.

Irregular Text Wrap Around Bitmapped Graphics

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
ClarisWorks and ClarisImpact can do an irregular text wrap around objects created with ClarisWorks or ClarisImpact draw tools. It can also do this with object-oriented PICT images you Insert, but only after ungrouping the object. The Ungroup command is in the Arrange menu.

If you apply the irregular text wrap option to other kinds of images (any paint frame, EPSF, TIFF or bitmapped PICT), the text will wrap only to the edge of the picture's frame, and not the boundaries of the image.

If you would like to wrap text around these other kinds of images, here's how you can do it:

1. Bring the image into your document.

- If you have an object-oriented EPSF image:
a. Select the arrow tool
b. Choose Insert from the File menu to open the image.

- If you are using a bitmap image with ClarisWorks (paint frame, TIFF, bitmap EPSF or bitmap PICT):
a. Create a Paint frame.
b. Choose Insert from the File menu to open the image. It is placed inside the paint frame.
c. Choose the arrow tool.

d. Set the paint frame border and fill to none. This makes the background of these images transparent.

- If you are using a bitmap image with ClarisImpact (paint frame, TIFF, bitmap EPSF or bitmap PICT):
a. Choose Place File... from the File menu.

2. Outline the boundaries of the image with the polygon, bezigon, or freehand tool.
3. Choose Move to Back from the Arrange menu.
4. Set the fill of the object from step 2 to white and the pen to none.
5. Choose Text Wrap from the Options menu (Text menu in ClarisImpact). Set the wrap to Irregular.

ClarisWorks and ClarisImpact will now wrap around the invisible object that you created in step 2 but will appear to wrap around the picture referred to in step 1.

MacWrite Pro allows irregular text wrap around all types of graphics without any workaround. Also, irregular wrap around inserted PICTs does not work until the object is ungrouped.

NOTE: if this solution does not work check to make sure text wrap has been turned off on the object described in step 1.

Macros Won‘t Use Function Keys Depending on Type of Keyboard (All)

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
When recording macros in ClarisWorks 1.0 and ClarisWorks 2.0, you have the option of using either an Option-Command key equivalent or a Function key to execute your Macro.

However, if the macro is defined on a Macintosh with no function keys (the Apple Standard ADB Keyboard or Mac Plus keyboard), the only function key which can be assigned is F5 (for newly-opened documents) or the last-defined function key equivalent (for macros which have been defined using an extended keyboard). Additionally, although that f-key can be assigned, it cannot be executed on that keyboard. If the file is opened on a Macintosh with function keys, F5 will work correctly.

If the macro is created using a keyboard with function keys, the function key equivalents will remain assigned for the macro if the file is opened on a Macintosh without function keys. This means that you would have to select Play Macro in order to execute the macro, or remap the key equivalents so that option-command keys are used. If the macro will be used in a mixed environment with some extended keyboards and some standard keyboards, option-command equivalents should be used to prevent misunderstandings.

MacDraw: Precision Bitmap Alignment

If a rectangle is created in MacDraw and two copies are printed to a LaserWriter, one may measure 150mm x 200mm, yet the other may measure 151mm x 201mm. There is a variation in both dimensions. Sometimes, however, they may match perfectly.

I'm using the LaserWriter in a four-layer printing process and find this inconsistency very annoying to work with.

Since the variation is in both dimensions and the age of the LaserWriter is relatively new, I believe that the paper weight (which is within specification), the paper finish, and the age of the LaserWriter are unlikely to be possible causes of the problem.

I would be satisfied if the LaserWriter fell within a specification, but since there is no specification outlining the acceptable variations, I am having problems.

Can you help?

This article has been archived and is no longer updated by Apple.

The size variance described is a result of PostScript interpretation of the bitmapped image. This results from attempts to change a 72-dpi image into a 300-dpi image. This is not an exact ratio. There may be as much as a 4% variance in PostScript's interpretation. PostScript's attempts at correction may vary slightly during each pass.

To compensate for this difference, choose Page Setup from the File menu. On the right side of the Page Setup dialog box there is an Options button. Click this button, and an additional dialog box appears. The fourth checkbox is labeled Precision Bitmap Alignment (4% reduction). Be sure this checkbox is marked. Using this option increases the printing time; however, the printouts will be consistent during each pass.

Spreadsheet and Text Frames in Paint Environment

Spreadsheet and text frames are converted to a bitmap in the Paint Environment as soon as you leave the frame.

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.

Spreadsheet Frames

If you create a Spreadsheet frame in the ClarisWorks 2.0 Painting environment and then click outside the frame, the spreadsheet is instantly converted to a bitmap. Consequently, you will not be able to add any more numbers or calculations to your Spreadsheet frame.

To prevent accidentally converting your spreadsheet into a bitmap before you are ready, create the spreadsheet in the Spreadsheet module and then copy/paste the data into a spreadsheet frame. Save a copy of the spreadsheet from the Spreadsheet module in case you need to update your Spreadsheet frame.

Text Frames

A text frame in a Paint document is fully editable until you leave the frame (i.e. select another tool) at which time the frame is bitmapped. If the Invisible Formatting Characters are showing at the time the frame is bitmapped then the Invisibles will also be bitmapped.

ClarisWorks 2.0 shows and hides Invisibles through Preferences, the Shortcuts palette and Command-;

Option-Print Bypasses Print Dialog - Problems with Fax Drivers

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
In Claris Works 2.0 and ClarisImpact, holding down the option key while selecting Print bypasses the Print dialog, sending the document directly to the currently selected printer.

Fax Drivers
Many FAX utilities allow you to fax from any application by pressing a key sequence when selecting Print. Normally the fax dialog comes up, and allows you to enter the phone number and cover page information. Since holding down the option key (plus any other key, if applicable) will send your document to the fax utility without a dialog, this has the undesired result of faxing to the last phone number used in the fax utility or printing to the currently selected printer.

Workarounds
Some fax utilities will allow you to select a new key sequence to activate them. Choose a sequence that does not use the option key (example: command-shift). If you cannot change the activation key from option to something else, you can:

1. Manually select the fax driver in the Chooser.
2. Use a macro utility like QuicKeys2 to change printer drivers with a key sequence.

3. Go ahead and option-Print, but cancel printing before the document goes to the fax utility by pressing command-period when you see the printing status dialog. Doing another option-Print will bring up the Print dialog for you to specify a phone number. For each document you fax, you will need to cancel the printing status dialog and option print again to bring up the Print dialog.

Note: Mention of third-party products is for informational purposes only and constitutes neither an endorsement nor a recommendation.

Application Modified or File is Busy, Try Again Later Message when Launching

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
There are two possible causes to this alert:

Cause #1:
If you have changed the name of a Claris application to have a period in front of it (for example ".MacWrite Pro"), the application will give you an erroneous error message that it has been modified and is not usable, or that the File in Busy, and to try again later. This only occurs on machines running System 6.

This is a well-known "feature" of all systems before System 7. Filenames starting with a period are supposed to be reserved for drivers (such as .Sony).

The solution is to remove the period from the front of the name.

Cause #2:
AutoDoubler is running, and has compressed the file before you have entered your name and serial number into the opening screen. The solution is to uncompress the file, run the application, personalize the app. with your name, etc. You can then let AutoDoubler compress the program, and it should work correctly.

Objects May Move When Ungrouping Imported Graphics (DR)

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.

When ClarisWorks for Windows 1.0v1 ungroups some Windows MetaFiles (.WMF files) that were originally created in other programs, it is possible that some of the objects will move slightly from their intended positions. The objects can be manually repositioned after ungrouping them to restore the original appearance of the graphic.

Customizing the Modem Initialization String (CM)

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
Question: How do I set the modem initialization string in ClarisWorks. Specifically, I want to turn off the modem speaker before dialing.

Answer: To customize the modem initialization string:

1. Open a new communications document or one you have previously set up.
2. Select Connection from the Settings menu.
3. Choose your modem type or Hayes-compatible from the modem popup menu.
4. From the same popup menu, choose Custom. (If you do not see a Custom item, hold down the option key before clicking on the menu. You have an earlier version of the Apple Modem Tool and should obtain the ClarisWorks 1.0v3 update or ClarisWorks 2.0 upgrade.)
5. You will be presented with a dialog which displays the initialization string for the previous selection. The string must begin with AT, and can be followed by whatever AT commands you want, all strung together. Add M0 (that's M-zero) to turn off the modem speaker. Consult your modem manual for details on the Hayes commands it recognizes.

If you want all new communications documents to default to this setting, title it ClarisWorks CM Options and save as ClarisWorks Stationery into the Claris folder in your System folder.

Transferring Files Between PCs and Macintosh Computers Via Modem or FTP

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.

With products such as FileMaker Pro and ClarisWorks that can read in data files created on a different type of computer, it is sometimes desirable to transfer the file between a PC and a Macintosh via a modem. The data files can be sent to the other type of computer and opened directly in the program's counterpart on the other platform without any sort of file translation. However, if you need to transfer files this way, you should ensure that the following holds true:

Whether transferring the file by modem or a network transfer program such as FTP, make sure that the file is not compressed. An extension on the filename of .SIT, .CPT, or .DD from the Macintosh, or .ZIP or .ARC from the PC would indicate that the file is compressed.

Via Modem:

---

1. The Macintosh communications software and the PC / Windows communications software must both be able to send and receive files via the same protocol, such as XMODEM, ZMODEM, or Kermit.

2. There are two possible types of "binary" file transfers on Macintosh computers. One is called MacBinary, and is used mainly when transferring files between two Macintosh computers. A more generic file transfer format is called Binary, and should be used when transferring files between Macintosh computers and non-Macintosh computers.

3. From the PC, the binary file type should be used.

4. As with all other modem communications, ensure that the two machines have are set to the same baud, parity, etc.

Via FTP:

TCP/IP users using FTP to transfer files should establish their connection in the normal fashion. Then, also follow steps 2 and 3 above, so that FTP can transfer the file in straight binary mode, rather than MacBinary mode.

For more information, consult the documentation that comes with your communications software package of choice.

300/600 DPI Print Options Do Not Appear in ClarisWorks (All)

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.

In some Windows applications, options are available in the Print dialog to select how many dots per inch (DPI) printers should use for output. For example, the Hewlett Packard LaserJet 4 can print to 300 DPI or 600 DPI, and some programs show a choice in the print dialog for 300/600 DPI.

These options do not appear in ClarisWorks for Windows because they are not part of the standard print dialogs that Windows provides to applications. To select the resolution that you would like for ClarisWorks for Windows to use, choose the Printers control panel, and select Setup for your printer.

Italicized Text Not Spaced Correctly

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.

Problem:
Italicized text displays on-screen with a large space after certain letters.

Explanation:
Some text characters in certain fonts request two character widths when displaying on-screen due to the limited resolution of video display. This will be true in any application that does not manually compensate through kerning or other letter spacing techniques.

Solution:
This issue does not effect printing, only on-screen display.

Copying from the Paint Environment and Pasting Elsewhere (PT,DR,WP,DB)

Copying from the Paint environment and pasting into another environment will create a Paint frame set at 72 dpi resolution.

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.
Copying from the Paint environment and pasting into another environment will create a Paint frame. This can be inconvenient for several reasons:

* The frame has a border and that border prints unless you change the pen color of the frame to white or translucent or apply a pen width of none.
* In order to resize the Paint object you must select the frame, use the Paint tools to select the objects inside and then use the Scale menu item to resize the object.
* ClarisWorks creates a default 72 dpi resolution paint frame, even if the graphic came from a Paint document set for a higher resolution.

To paste paint graphics as one draw object instead of a paint frame, first paste the painting to the scrapbook. Then copy the image from the scrapbook and paste it into the Draw module. This will remove the Paint frame and allow the object to be resized like a Draw object. However, it will be a 72 dpi graphic, even if the Paint document was set for a higher resolution.

Note: Even if a paint document is set to a resolution greater than 72 dpi, the image will be pasted into a draw document as a 72 dpi bitmap. To return the graphic to a greater resolution, double click in the paint frame you pasted and choose Resolution & Depth from the Format menu to change the settings. It is not possible to paste a ClarisWorks Paint graphic with a resolution greater than 72 dpi into another program. Instead, Save As PICT.

Entering Invisible Characters with Command Key in the Find Dialog (WP)

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
ClarisWorks can search for invisible formatting characters such as tabs, returns and column/page breaks. For a complete list, refer to page 2-30 of the User's Guide for ClarisWorks 2.0.

The manual states that you can use Command-Tab to enter a tab, Command-Return for a return and Command-Enter for a break. However, using these key commands causes the find to be performed immediately and does not let you enter additional settings.

Workaround:
Use the alternate methods listed in the manual and below in place of the Command-key sequences.

\\t = Tab
\\p = Return
\\c = Page or Column Break

NOTE: This problem does NOT occur in ClarisWorks 1.0
Published Date: Feb 18, 2012

GIF Files That Won‘t Translate

The GIF translator only supports the GIF 87A standard. ClarisWorks currently cannot translate other types of GIF files.

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.
The GIF XTND translator included with ClarisWorks 2.0 only supports the GIF 87A standard. Trying to open an 89A type GIF file will result in a message that the translator could not read the file. Other GIF types may not appear in the Open dialog.

You can convert these GIF files to the ClarisWorks-compatible GIF format by using GIFConverter. This is a shareware program available on Macintosh computer BBS services (AOL, Compuserve, etc.) and from user groups. To do this:
1- Open the GIF file in GIFConverter
2- Choose Save As
3- Click the Options button
4- Click the checkbox for "87A compatibility"
5- Click OK
6- Name the file, then click Save

This file can now be opened or inserted into ClarisWorks.

Macros Don‘t Record Clicking the Close Box (All)

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
ClarisWorks 2.0 macros do not record clicking the close box of the Find/Change, Help and Clipboard windows.

If you record a macro which closes one of these windows by clicking the close box, and then goes on to perform other actions, playing the macro will result in the message: "Menu item not found; macro aborted."

To recreate the problem:

1. Choose Record Macro from the File menu
2. Type Command-F
3. Type in a word that can be found in your current document
4. Close the Find window by clicking the close box in the upper left
5. Make the found word Bold.
6. Choose Stop Recording from the File menu
7. Perform the Macro

As you watch the macro play, notice that it does not close the Find window. Since the Find dialog isn't closed, and the only menus that appear with it open are File, Edit and View, the Bold command cannot be performed and you get the message: "Menu item not found; macro aborted."

Workaround:
Use the keyboard equivalent for closing a window (Command-W).

NOTE: ClarisWorks 1.0 doesn't exhibit this issue.

Published Date: Feb 18, 2012

Wrong Help Screen Comes Up ?? Not Context-Sensitive (All)

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
Both ClarisWorks 1.0 and ClarisWorks 2.0 provide context-sensitive help by choosing Help from the Apple menu. However, installing ClarisWorks 2.0 might cause confusion if you are using both ClarisWorks 1.0 and ClarisWorks 2.0 on the same machine.

Since both applications use a file called "ClarisWorks Help," and since the upgrade installer replaces the 1.0 help file in the Claris folder with the 2.0 help file, choosing Help in ClarisWorks 1.0 after installing ClarisWorks 2.0 will often result in the wrong help screen coming up. Other reasons why the wrong version of the help system might be used include customized installations, installing on an external hard drive or launching a copy of ClarisWorks 2.0 that was installed on a network volume.

The workaround is to place the ClarisWorks 1.0 Help file in the ClarisWorks 1.0 folder and to place the ClarisWorks 2.0 Help file in the ClarisWorks 2.0 folder. The Claris Help System file will need to exist in both the 1.0 and 2.0 ClarisWorks folders. Make sure that there is no ClarisWorks Help file in the Claris folder in the System Folder. Since each application will use its own version of the help file (even though both are using the updated Claris Help System file), erroneous help screens will not come up.

Note that if you leave any ClarisWorks Help file in the Claris folder, each copy of ClarisWorks might use it, but will use it differently, depending upon the version of the Application and the Help file:

Help 1.0:
ClarisWorks 1.0 - No Problem
ClarisWorks 2.0 - No Context Sensitive help. Help System opens to Index, but works normally. Not all of the new features are described. (If the new help file is in the same folder as ClarisWorks 2.0, it will be accessed normally, regardless of what Help file is in the Claris folder.)

Help 2.0:
ClarisWorks 1.0 - Mistaken Context-Sensitivity brings up wrong help screens, some of which talk about features which are not present in ClarisWorks 1.0.
ClarisWorks 2.0 - No Problem

Error (-47) While Installing Communications Tools On A PowerBook or on a Quadra 660AV/840 AV With an Apple GeoPort Adapter (CM)

Active Serial Tool can prevent the installation of communications tools. Turn off extensions for a successful installation.

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.
If you are installing ClarisWorks 2.0 or 2.1 onto a volume that currently has the Apple Serial Tool installed (usually PowerBooks with internal modems), the Apple installer that ClarisWorks uses will generate a -47 error message (File is Busy) when installing Disk 3. You will also get this message when installing ClarisWorks on a Quadra 660 AV or Quadra 840 AV that has the Apple GeoPort Adapter (which is essential for using the telephone, answering machine fax features) installed.

This is because we update the Serial Tool as part of our installation procedure. Because the Serial Tool is active on startup, we are not able to replace it, hence the File is busy alert. The Apple installer cannot handle conditional installs (if file is busy, then skip to next),so the installation is canceled when the error occurs.

Solution:
Restart and hold down the Shift key until you see the message "Extensions off." Then run the installer. Restarting without extensions will turn of the Serial Tool and allow the complete installation to take place. In the case of the GeoPort software, you could also specifically disable it before attempting installation.

Find/Change does not Work with Greg‘s Buttons 3.0 (All)

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
This has been fixed by Greg's Buttons version 3.2 and above.

Greg's Buttons 3.0 has a feature that allows you to fill alerts and dialog boxes with color. Unfortunately this feature conflicts with the Find/Change dialog in ClarisWorks 1.0 and 2.0. Find/Change may appear to work at first but after closing the Find/Change window any attempt to access it again will fail.

Workaround:
Just turn off the Colorize Alerts and Dialog boxes feature or exclude ClarisWorks with the Exclude button.

Spaces Lost Between Text Followed by Repeated Punctuation Characters (WP)

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.

If you have text at the beginning of a line followed by a repeated punctuation character (such as 'Total Amount Due.....') the spaces in the text may get closed up (such as 'TotalAmountDue.....'). This happens in all versions of ClarisWorks.

The workaround in ClarisWorks 2.0 is to use a tab fill character, which is set up in the Tab dialog.

ClarisWorks: Applying Patterns, Colors, Gradients to Text

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.

Method 1:
The easiest way to apply a pattern/color/gradient to text is to use the Paint Bucket:
1. Select the color or pattern you wish to apply to the text.
2. Click the paint bucket tool.
3. Position the paint bucket over the letter you want to change and click once.
4. Fill one letter at a time.

Method 2:
A painting or scanned image can be applied to text but the method is more complex (this method can also be used to apply color/pattern/gradient to many letters at once):
1. First paint your custom pattern or import your scanned image (make sure the image is large enough to cover all the text).
2. Select the text using the Lasso tool or the Selection Rectangle with the command key (if you press the Command key while dragging the Selection Rectangle, the selection will enclose just the image and none of the surrounding white area).
3. Move the selected text onto the pattern or scanned image.
4. Select the Transform menu and choose Pick Up.

Method 3:
The only problem with the former method is that it will fill letters that have loops (Ex: "O", "P", "Q", etc). The following method is more tedious since it requires you to fill one letter at a time but the results are cleaner:
1. First paint your custom pattern or import your scanned image (make sure the image is large enough to cover all the text).
2. Select the Magic Wand tool.
3. Click on a letter (first try a letter that has a loop in it).
4. Move the selection onto the pattern.
5. Select the Transform menu and choose Pick Up.
6. Move the text away from the pattern.

NOTE: You might also try drawing a line under the text so that it connects the bottoms of all the letters. This way, you won't have to select each letter individually. After you have applied the pattern/color/gradient you want, erase the line.

Method 4:
You can also fill multiple letters by using the Fill command under the Transform menu. To do this:
1. Use the Command-Select with the square selection tool (or the lasso) to select the text that is to be filled.
2. Select the color or gradient that you want to use.
3. Click Fill under the Transform menu.

This will fill in o's,e's,r's etc. in which case use the Magic Wand method previously mentioned.

Generating Control Characters with Macintosh Plus (CM)

The Macintosh Plus does not have a Control Key, you can create a Macro to work around it.

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.

Question:
How can I generate control-characters in the communications environment when I dial into a host computer? I have a Macintosh Plus and it doesn't have a control key. Other communications packages let me use the option key as the control key.

Answer:
The Communications Toolbox from Apple Computer, Inc., which ClarisWorks uses to provide Communications capabilities, doesn't support mapping the option key to the control key for Macintosh Plus owners. You can however, create a macro on a computer which has a control key and execute that macro with a key sequence on your Macintosh Plus.

Published Date: Feb 18, 2012

Opening 1.0 Communications Documents in 2.0 (CM)

After installing ClarisWorks 2.0, opening a ClarisWorks 1.0 communications document set to use the Apple Modem Tool deletes the phone number and results in an error message.

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.
After upgrading to ClarisWorks 2.0, when opening ClarisWorks 1.0 Communications documents which have the Apple Modem Tool as the selected Connection tool, you will get the message: "Could not configure connection tool." The document will open, but the phone number will be missing.

Explanation:
ClarisWorks 2.0 automatically updates the Apple Modem Tool to Version 1.1.1. The new tool does not properly open old ClarisWorks documents. Trying to open up the documents with ClarisWorks 1.0 will result in the same error message.

Solutions:

A. Reenter the phone number, check the other settings and save the converted document.

B. Replace the new Apple Modem Tool (in the Extensions Folder in the System Folder) with the older tool from the ClarisWorks Communications Folder on the ClarisWorks 1.0 Communications Disk. This is not recommended since the new tool contains enhancements.

Grammar Checkers for ClarisWorks and MacWrite Pro

A list of grammar checkers which support the ClarisWorks and MacWrite Pro file formats and those which plan to in the future.

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.
1. Supports grammar checking through the clipboard:

Correct Grammar
SoftKey International, Inc.
800-227-5609 (Sales)
404-428-0008 (Technical Support)

2. Currently supports grammar checking for ClarisWorks 1.0 files:

Grammatik 5 For The Mac
WordPerfect Corporation
801-228-9917 (Customer Support)
801-225-5000 (General)

3. Not planning to support Grammar checking for ClarisWorks or MacWrite Pro files

Sensible Grammar For The Macintosh
Quality Computers
800-777-3642
313-774-7200

RightWriter Mac
Que Software
800-992-0244

NOTE: All of the above Grammar checkers do support MacWrite II format. See page 2-21 in the ClarisWorks 1.0 Handbook or page 2-14 in the ClarisWorks 2.0 User's Guide for assistance in saving to MacWrite II format. No grammar checker to date supports ClarisWorks 2.0 files.

Sensible Grammar can check a document on the Macintosh clipboard. You issue a Select All Command (Command-A) followed by a Copy Command (Command-C) to copy the document onto the clipboard. Then you use Sensible Grammar to check the text. Although this saves the format of your document, Sensible Grammar can only suggest changes in the text on the clipboard and cannot make the actual changes. You have to write down the changes and enter them manually after you return to ClarisWorks.

Date Format Preference and Insert Date Have Incorrect Information or "D"‘s Where a Date Would Be Expected

On machines that have had Windows 3.0 installed, a setting for an International preference may not get set correctly. Quit ClarisWorks, open the International Control Panel, click OK, and close the control panel to reset the preference properly.

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.

Problem:
Date Format menu in Preferences has "D"s instead of dates. When you choose Insert Date, you get these "D"s within the Date string.

Explanation:
This only happens with Windows 3.0 or when you install Windows 3.1 over a 3.0 installation. Windows 3.0 sometimes has an incorrect international setting that does not get reset when you install Windows 3.1.

Solution:
1. Exit from ClarisWorks
2. Open the International Control Panel
3. Click the OK button
4. Relaunch ClarisWorks

Saving Default Settings Using Stationery for ClarisWorks Windows

How to set default settings for your ClarisWorks documents, including special steps for the Communication module. The manual accidentally omitted how to set these automatic documents.

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.
ClarisWorks for Windows 1.0v1 has the ability to store many default settings that are not in the Preferences dialog. Examples of such settings might be the default font to use, default size, page margins, or even a default logo to place in the header. To set these defaults, setup a new, blank document with all of the settings as desired, then choose Save As from the File menu. The file type should be changed from ClarisWorks to ClarisWorks Stationery, and the file should be saved in either the ClarisWorks directory, or the Claris directory (which is usually located as a sub-directory under the Windows directory). The name for the file should be one of the following:

WPOPTION.CWS -- Word Processing Default Options
DBOPTION.CWS -- Database Default Options
SSOPTION.CWS -- Spreadsheet Default Options
GROPTION.CWS -- Graphics Default Options

The communications module simply launches Microsoft Terminal, which ships with Windows. Since it is not a native ClarisWorks application, saving the settings is a little bit different. Do the following to save the default baud rate, communications port, etc. for the communications module:

1. Open a new communications "document".
2. From Terminal's Settings menu, select the appropriate communications, terminal preferences, binary transfer settings, etc.
3. Do not set the phone number unless you will always dial the same number all the time.
4. From the File menu, choose Save As.
5. You can name your settings file anything you wish, as long as it adheres to the standard DOS naming conventions of eight characters (no spaces) followed by the extension for the program, e.g., DEFAULT.TRM.
6. It is best to save the file in your Windows directory, where Terminal.exe is located. This will require you to change the directory from C:\\CLWORKS to C:\\WINDOWS.
7. Exit ClarisWorks.
8. Use a text editor such as Notepad or Write to edit the CLARIS.INI file, which is located in your Windows directory.
9. In the [ClarisWorks] section, edit the "Terminal=" line to indicate that you want Terminal to launch using the file you created in Step 5, above. In this example, Terminal will launch with the settings file, default.trm. For clarity, a caret is used to indicate that you should type a space.

Terminal=TERMINAL.EXE^C:\\WINDOWS\\DEFAULT.TRM

Importing Certain CGM Files May Cause ClarisWorks 1.0v1 to Crash

Some non-standard forms of the CGM file format will cause ClarisWorks 1.0v1 to crash because of of the way that the file is saved.

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.

ISSUE:
Importing CGM files imported from certain applications (i.e. Professional Draw) causes ClarisWorks 1.0v1 to crash.

Explanation:
A small number of applications export CGM files in a non-standard format. This file type is not supported by ClarisWorks for Windows.

Solution:
Export the file from the original application using another format.
Published Date: Feb 18, 2012

Kerning Incorrect When Using Generic / Text Only Printer Driver

The Generic / Text Only printer driver does not support graphics, which includes TrueType fonts, but ClarisWorks does not remove TrueType fonts from the Font Menu to reflect this limitation.

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.
If the kerning or spaces between characters appears too tight in some places, and too loose in others, make sure the default printer driver is not set to Generic/Text Only. The Generic / Text Only printer driver does not support graphics, which includes TrueType fonts, but ClarisWorks for Windows 1.0 still lists TrueType fonts in the Font menu.

To restore proper kerning, you should first select a different printer driver to be the default printer in the Windows Control Panel. Select all the text in your ClarisWorks document and choose the font that you want to use from the Other... item in the Font menu, even if the font appears in the Font menu list.

Locking a File Does Not Work

Locking a ClarisWorks 2.0 document from the Get Info dialog box does not work.

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.
This problem has been fixed in ClarisWorks 2.1.

Selecting Lock File from the Get Info dialog box does not prevent you from saving changes to a ClarisWorks 2.0 document. You will get warning messages that the file is locked when you open the file, but the file is not read-only as you might expect.

The problem occurs in the French version of ClarisWorks 2.0 as well.

Using Sony Monitors With Display Card 8/24GC

I want to use the Sony MultiScan CPD-1304 monitor with the new Display Card 8/24GC. Will this work?

This article has been archived and is no longer updated by Apple.
If the CPD-1304 monitor works with the Macintosh High-Resolution Video Card (the current 8-bit display card), there won't be any problem with the Display Card 8/24GC signals driving the Sony CPD-1304. (We have not been able to verify that the CPD-1304 monitor works with the Macintosh High-Resolution Video Card, but we do know that Sony's CPD-1302 monitor works with that card.) However, you will need to use a different cable to connect the two devices because the cards have different connectors.

An issue with regard to the cable concerns the sense pins, which tell the card what type of monitor is attached. For the Sony CPD-1302 monitor, the sense pins should be configured as below, where 0 = Ground and 1 = Not Ground. To ground a sense pin, tie it to the C&VSYNC.GND signal.

Sense pins			Hor x Vert Dot		Vert
10	7	4	Display	Pixels	Clock	Refresh
1	1	0	12" Monochrome Monitor	640 x 480	30.24	66.7
			13" Color Monitor			

Here are the pinouts for the Macintosh Display Card 8/24GC:

Pin	Signal	Description
1	RED.GND	Red Video Ground
2	RED.VID	Red Video
3	CYSNC~	Composite Sync
4	MON.ID1	Monitor ID, Bit 1 (also known as SENSE0)
5	GRN.VID	Green Video
6	GRN.GND	Green Video Ground
7	MON.ID2	Monitor ID, Bit 2 (also known as SENSE1)
8	nc	(no connection)
9	BLU.VID	Blue Video
10	MON.ID3	Monitor ID, Bit 3 (also known as SENSE2)
11	C&VSYNC.GND	CSYNC & VSYNC Ground
12	VSYNC~	Vertical Sync
13	BLU.GND	Blue Video Ground
14	HSYNC.GND	HSYNC Ground
15	HSYNC~	Horizontal Sync
Shell	CHASSIS.GND	Chassis Ground

Double-Clicking on Application Icon Not Showing New Document Dialog or Opening New Document Window

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.

If you double-click on the ClarisWorks or ClarisImpact program icon and the New Document dialog does not appear, this means that it is already running in memory on your computer. (Even though you may not have any document windows open, the program can still be running in RAM). This is normal, and virtually all programs on the Macintosh perform this way.

To open a new document, do the following:
1. Double-click the application icon
2. Select the New command from the File menu

Additional Background Information:
You can tell that a program is running in several ways:
1. The icon is grayed or darkened
2. System 7: The application menu in the upper right corner lists the program name
3. System 6, MultiFinder On: The application name is listed at the bottom of the Apple menu.

About Version 2.0 Macintosh, Press Release

Early users rave about superior integration, new features;"This is the only product I need"

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.

SANTA CLARA, Calif. -- March 24, 1993 -- Claris Corporation today announced that ClarisWorks 2.0, the complete productivity solution for business, education and home, is shipping and now available at authorized Claris resellers in the U.S. ClarisWorks 2.0 extends the lead of the #1-selling Mac "Works" program with clearly superior integration and ease of use, and more functionality than any other Mac integrated product.

ClarisWorks adds three completely new capabilities to the program and more than 300 productivity enhancements to the existing environments. In addition, push-button Shortcuts make ClarisWorks 2.0 even easier to use than the original award-winning version. And users of PowerBooks and lower-end Macintosh computers will find that compactness and speed have not been compromised: at under 600K, the application is still the smallest in the integrated category and as fast as ever.

Beta Testers Praise ClarisWorks 2.0

Early users of ClarisWorks 2.0 praised the product's unique integration and extensive new capabilities. "ClarisWorks is a great value for its price," said Michael Cohen, a producer at the Voyager Company in Santa Monica, Calif. "It's incredible that there's so much power in a program that takes up less than a megabyte!"

John Hindle, member of the Carleton Board of Education in Nepean, Ontario, said, "The ease of use, transparency of integration and depth of each of the new components in ClarisWorks 2.0 combine to make this software the premier integrated package on the market. There is no equal."

Bill Bowden uses ClarisWorks 2.0 on a range of Macintosh computers including powerful Mac IIfx systems and low-end Mac SE and PowerBook computers at the British Columbia Automobile Association in Burnaby, BC. "For tracking travel customers and organizing mailing lists, ClarisWorks 2.0 is ideal. Its new features give you more options, yet the program is simple to use -- any level of computer user can operate it," said Bowden.

"It was love at first sight," for Frank Short, computer services coordinator for the Ossinging Union School District in New York. "ClarisWorks 2.0 is ideal for the 250 middle school students in our district who use computers in the classroom. It is a much richer product than Microsoft Works. And because all the components are on one page, it is easier to use and easier to train others on. ClarisWorks 2.0 is the only product I need," said Short.

For editor Lou Flemal, new word processing features and painting capabilities in ClarisWorks 2.0 make it simple to create his Scuba Diving Club newsletter. "Text wrap and improved tab and column controls turn the word processor into a user-friendly page-layout program. And thanks to the new painting capabilities, I don't have to leave ClarisWorks to edit the graphics that will be inserted into my newsletter," said Flemal.

Dave Kile, president of Alpha Technologies Group in Marriottsville, MD, produces and distributes a software movie collection called "ClipTime" to the educational community. "ClarisWorks 2.0 really packs a powerful punch for education customers who want to integrate slide show presentation capabilities into the classroom," said Kile. "ClarisWorks 2.0 allows me to demonstrate my product easily and take advantage of its sophisticated functions for a very reasonable price -- with no technical hassles."

Key Enhancements

ClarisWorks 2.0 includes new outlining, presentation slide show and painting capabilities to address the day-to-day demands of most generalist computer users who produce a range of documents and need to manage information. It also boasts enhancements to all of the original environments: word processing, spreadsheet, charting, database, graphics and communications.

Automatic text wrap around graphics enables users to create more professional-looking newsletters, brochures and flyers. Custom text styles, expanded spell check selection and show/hide invisibles speed word processing tasks.

Users now have 12 chart type options including combination and pictogram to translate data into compelling charts. Additional new spreadsheet capabilities include text wrap in a cell for producing professional tables and a lock title option.

New automatic database field entry and validation options eliminate repetitive keystrokes and ensure database accuracy and consistency. Support for more than 50 predefined Avery label formats makes it simple to create mailing labels.

Bezier curves and 32 gradient fills add to the array of powerful graphics tools. Expanded communications capabilities such as Kermit file transfer support let users modem documents anywhere. ClarisWorks 2.0 also supports System 7 features including Publish and Subscribe and Balloon Help.

ClarisWorks 2.0 also features a new Shortcuts option that offers users unique push-button access to frequently-used commands. Users can

perform 150 tasks from spell checking to formatting spreadsheet cells by simply clicking an icon from the floating, dockable Shortcuts palette.

Pricing Information
The price of ClarisWorks 2.0 remains unchanged from the original version. In the U.S., the suggested retail price is $299. Upgrades from ClarisWorks 1.0 are $99. A $129 competitive trade-up price is also being offered through Sept. 30, 1993.

About Version 2.0 Macintosh, Product Fact Sheet

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.

Product Description:
ClarisWorks 2.0 software is the complete productivity solution for business, education and home.

ClarisWorks 2.0 dramatically enhances the already #1-selling Macintosh Works product. It adds brand new capabilities such as outlining and presentations, and enhances each existing environment while retaining the superior integration, small size and speedy performance of ClarisWorks 1.0. And new Shortcuts make it even easier to use than the original award-winning version. The result is an even better value than ClarisWorks 1.0 that will appeal to a broader customer base of generalist users.

Target Customers:
* Small and Medium Business users will find that ClarisWorks 2.0 is the only general productivity tool they'll need for creating standout letters, memos, reports, presentations, proposals, sales flyers, address books, contact lists and newsletters.
* K-12 Educators will find ClarisWorks 2.0 to be an even better teaching tool with new important capabilities such as presentations, outlining, painting and Kermit support, yet retaining the simplicity, superior integration and size of the current favorite, ClarisWorks 1.0.

* Large Corporations will minimize their hardware and software acquisition and training costs. The superior integration, consistent user interface and new Shortcuts feature in ClarisWorks 2.0 let new users and field staff using PowerBooks get the most out of their computer. And outstanding Claris customer support, combined with the product's on-line help and in-box training materials, ensure users will be productive from the start.
* Mobile professionals will benefit from the program's small size -- which is still under 600K -- and speedy performance. And with its extensive file exchange capabilities, users can read and save files to most other popular software programs, even in multi-platform environments.
* Higher Education students, faculty and administrators will use ClarisWorks 2.0 as a one-stop productivity tool. Its new outlining, full-strength word processor and extensive charting capabilities perfectly address the expanding needs of college users.
¥ Home users will appreciate the excellent value ClarisWorks 2.0 offers them. At the same price as ClarisWorks 1.0, users get three completely new capabilities, more than 300 enhancements, and Shortcuts to improve their productivity.

Key Enhancements:
New Capabilities
* Complete outlining feature allows users to organize their thoughts and documents using seven popular outline styles including Harvard, legal, numeric and bulleted formats.
* Presentation Slide Show with QuickTime support. Users can create dynamic slide show presentations complete with background and border colors, QuickTime movies and fade between slides. Presentations can be either manual or auto-advance.
* Shortcuts offer push-button access to the 150 most frequently used commands such as spell checking, cell formatting or auto-summing. Just as with the menus, the icon palette automatically configures itself to the environment being used (e.g. text or spreadsheet).
* Full-color paint capabilities and 32 gradient fills allow users to add even more striking graphic effects to documents.
* With all these new capabilities, ClarisWorks 2.0 is still under 600K.

New Word Processing Features
* Automatic text wrap around graphics creates more professional-looking brochures, flyers, newsletters and more.

* Custom text styles allow users to create, name and save frequently-used text styles for instant access.
* Individually variable column widths. Users simply click on the column controls button to automatically add columns to their layouts; then visually adjust column size by dragging the column to the preferred width.
* Show and hide invisible characters allow users to view all format commands in their documents for accuracy.
* Expanded spell check selection. Users can now spell check either their entire document or only specific blocks of text.
* Original date and time clock permanently reflect the original date and time a document was created.

Expanded Charting and Spreadsheet Capabilities
* Hi-Low-Close charts are ideal for tracking pricing trends, such as stocks, with defined beginning and end points.
* Combination charts allow users to combine chart options -- like using a line chart with a bar chart -- to illustrate contrasting data more effectively.
* Pictogram charts translate plain numeric data into compelling charts that graphically depict data.

* Unparalleled chart format customization. Users can customize any or all of their charts -- change fonts, styles, adjust orientation, title and legend placement and size, select symbols, colors, scales, patterns, 3D and more.
* Spreadsheet cell wrap. When cell wrap is applied, text automatically wraps within the cell boundaries.
* Lock Title option locks column headings in place so they remain in constant view for quick reference as users scroll through documents. This also reduces the need for screen splitting.

New Database Features
* Automatic field entry from pop up menu. Users can save time and avoid repetitive data entry by creating a pop up list of data. This also ensures data consistency and accuracy.

* Automatic serial numbering.
* Automatic date, time, creator, and modifier stamps.
* Automatic field validation (uniqueness, within range, emptiness).
* More than 50 predefined Avery label formats make it a snap to generate labels.

Graphics Enhancements
* Color paint environment includes 18 tools and six transformation effects.

* Gradient palette adds pizzazz to presentations with 16 black and white and 16 color gradients.
* Bezigon and Polygon drawing tools make it easier than ever before to create and style curves and shapes.
* Repeat Object Placement simplifies the placement of duplicate graphics by automatically placing duplicates of graphics in equidistant sequence from the original.

Communications
* Kermit file transfer protocol enables educational institutions and others that use this protocol to send files easily.
* Phone Book. Users can enter all frequently used phone numbers into the Phone Book. Then, by simply selecting the name of a person they wish to contact, the phone number is automatically dialed.

System 7 Support
* Publish and Subscribe
* Apple events
* Balloon Help.

In-Package Support Materials:
* Users Guide
* Getting Started Guide with tutorial
* Quick Reference Guide
* Context-sensitive Help system
* Free America Online software and registration to access online support.

Support Services for Registered Owners:

Customer Relations
* Maintains registered customer database.
* Handles non-technical questions, i.e., registration status, etc.
* (408) 727-8227
* Phone lines staffed from 8 a.m. - 5 p.m. PST, Monday through Thursday and 8 a.m. - 2 p.m. PST, Friday.
* (800) 544-8554 for product upgrade order forms and instructions.

Technical Support
* Handles technical questions, problems with operating the software.
* Consists of a dedicated team of Technical Support Specialists.
* (408) 727-9054.
* Phone lines staffed from 6 a.m. - 6 p.m. PST, Monday through Thursday and from 6 a.m. - 2 p.m. PST, Friday.
* 24-hour Voice AnswerLine, (800) 735-7393.
* 24-hour Fax AnswerLine, (800) 800-8954.
* Support is also available through Claris forums on America Online and CompuServe.

System Requirements and Compatibility:
* Macintosh Classic, LC, Plus, SE, II family or portable computers.
* Requires 2 floppy disk drives and 1 MB RAM (use of Communications module requires hard disk and 2 MB. System 7 users require 2 MB.).
* Hard disk recommended.

* System 6.0.5 or higher.

Price and Availability:
* $299 suggested retail in the U.S.
* $99 upgrade price in the U.S.
* $129 U.S. competitive trade-up through September 30, 1993.
* ClarisWorks 2.0 will be available in the U.S. in March, 1993.

Cell References Not Updating in Spreadsheet Formulas

A problem exists in ClarisWorks 1.0 v1 for Windows where cell references in formulas with very long text strings do not always get updated correctly. Shortening the formula or placing the string in another cell and referencing it in the formula should fix this problem.

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.
Cell references in spreadsheet formulas with very long text strings do not always get updated correctly.

There are two simple workarounds to this problem:

1. Shorten the text string in the formula.

2. Put the long text string in another cell and use a reference to it in your formula

Example: If your formula currently reads as:
="Total this Quarter in US Sales - $"&SUM(A1..A10)
you could place "Total this Quarter in US Sales - $" into a cell (e.g. C20) and reference it in your formula:
=C20&SUM(A1..A10)

Creating a New Layout with More Fields Than Can Fit on a Single Page

When creating a new layout, fields won't be added if they extend beyond the bottom of the page. They can be added manually using the Insert Field command from the Layout menu.

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.
In ClarisWorks for Windows 1.0v1, creating a new layout in a database containing more fields than can fit vertically down a page creates labels for all the fields, but only creates the number of fields that can fit on the page.

To add those fields that were not automatically added to the layout, Choose Insert Field from the Layout menu, Choose a field and click the OK button. You can then manually place the field anywhere on the layout.

Imported WordPerfect File has no Left or Right Margins

An imported WordPerfect file has no left or right margins.

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.

WordPerfect does not keep track of margins for an entire document, only for each paragraph. In ClarisWorks, individual paragraph margins cannot be outside of the margins set for the whole document. For example, consider a WordPerfect document in which all paragraphs but one have a left margin of one inch. The fifth paragraph out of ten has a left margin of zero. When this document is brought into ClarisWorks, the "global" document left margin must be zero, even though there is only one paragraph with this margin. Since there is always a possibility of encountering a paragraph with a zero margin within a Word Perfect document, and since in ClarisWorks, individual paragraphs must have margins equal to or greater than the "global" document margin, the WordPerfect filter sets the value of the "global" document left and right margins to zero.

Currently there is no workaround to the issue.

Inserted Footnotes Do Not Automatically Renumber Existing Footnotes

If a document already has footnotes in it, and a document with footnotes is inserted into the original document, the footnotes are not all automatically renumbered.

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.
In ClarisWorks for Windows 1.0v1, inserting a document with footnotes into a document that already has footnotes does not automatically renumber the footnotes.

You must manually renumber the inserted footnotes.

Loading an Invalid Macro File Displays Incorrect Error Message

Attempting to load an invalid file as a Macro file will give the same message as trying to load an invalid document.

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.
In ClarisWorks 1.0v1, if you attempt to load an invalid Macro file, you will get the following error message:
"Unknown file type. This file cannot be opened as a ClarisWorks document."

This same message is presented whenever an invalid file is loaded, independent of whether that file is a document or macro file.

Ungrouping a Two-Sided WMF Polygon Gives it a Third Side

Two-sided polygons saved to the Windows MetaFile (WMF) format have a third side added to them when they are ungrouped in ClarisWorks. Saving the object as a PICT in its creator application and reinserting the PICT (.PCT) instead corrects this issue.

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.
In ClarisWorks for Windows 1.0v1, if you ungroup a two-sided polygon that was inserted from a Windows MetaFile (.WMF) document, it will be given a third side, closing the polygon.

Save the object as a PICT (*.PCT) file and reinsert it before ungrouping it.

WK1 Files Lose All Text Color Formatting When Translated into the ClarisWorks Spreadsheet Format

When importing or exporting information from or to the WK1 or WK3 format, text color, font, and style information is lost. This is because our translation system only looks for the actual spreadsheet file, and not for the FMT (formatting) file that accompanies it.

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.

When importing WK1 files into ClarisWorks for Windows 1.0v1, all of the text color formatting is lost.

No color, font or style information is being imported or exported in any of the Lotus filters currently. Only WK1 and WK3 formats support formatting information, and they do it by using a second file to keep this information (.FMT and .FM3). Our filter system is not currently setup to deal with input and output to two different files at once.

At this time, there is no workaround for this, other than to re-stylize the text once it is translated into the ClarisWorks format.

Arial Not Available in the Font Menu

ClarisWorks for Windows places the first 22 fonts in the font menu. It is possible that Arial will not show up in this list, even though it is still going to be the default font. Manually adding it to the menu will fix the problem.

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.
If you install ClarisWorks for Windows 1.0v1 with ATM turned on, it is possible that Arial will not be available in the font menu even though it is still the default font.

When you install ClarisWorks, it creates the font by taking the first 22 fonts in the system. It is possible that Arial will not be among them.

1. Choose Other... from the Font menu and manually add Arial by clicking the Add to Menu checkbox.
2. Turn ATM off before installing ClarisWorks for Windows.

Printing Large Bitmaps to Postscript Crashes in Windows 3.0

If ClarisWorks for Windows crashes while trying to print a large bitmap to a Postscript printer, reducing the size of the bitmap, or rotating it in the original creator of the bitmap and then importing into ClarisWorks, should fix the issue.

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.
ClarisWorks for Windows 1.0v1 will crash if you try to print a large rotated bitmap image to a Postscript printer under Windows 3.0 only.

Reduce the size of the bitmap image or do not rotate it in ClarisWorks (i.e. rotate the graphic in the original graphics package first before inserting it into ClarisWorks).

PICT Graphic Disappears when Scaling or Zooming

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.

A PICT image which entirely disappears when you scale, stretch it or use the zoom feature is probably corrupt. This has only been reported with a PICT graphic which was created in another application and brought into ClarisWorks or ClarisImpact.

To remove the corruption, copy the image, paste it to the Scrapbook (a Desk Accessory in the Apple menu), then copy from the Scrapbook and paste back into ClarisWorks. Alternatively, you can copy the image to a Draw document, Save As PICT and Insert/Place the PICT file.

Modifying Application Resources

Using resource editing utilities like ResEdit has several implications for Claris applications.

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.

Using resource editing utilities such as ResEdit, some Macintosh enthusiasts modify their system and applications to suit their personal preferences. An example is modifying command key equivalents for menu items.

Claris Technical Support does not support the use of ResEdit or any other resource editing utility. Resource editing has several implications for Claris applications:

Compressed Resources Un-modifiable:
The resources of some Claris applications are compressed. The benefit is that application size is decreased, taking less space on your hard drive. However, a side effect is that compressed resources cannot be edited.

Updaters:
Claris releases updaters from time to time which take an existing copy of a Claris application and create a new version which is up to date. Updaters will only work on unmodified Claris applications. If you run an updater on a modified Claris application, you will get an error and the update will be aborted. The solution is to reinstall the application from your original diskettes and run the updater on that copy.

System Crashes & Anomalies:
ResEdit is a powerful program in that it can change the actual programming code an application uses to run. Used improperly, it is possible to undermine stability or even render an application useless.

Basic Algebraic Expressions

Description of the parts of an Algebraic Expression

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.

In several of Claris products you can produce algebraic calculations. While it is not usually necessary for us to know how to come up with the correct calculations, it is helpful to know how they can be set up.

VARIABLES: In products without scripting languages, there are no ways to describe a variable as such. In other words, you can't 'solve for X' in an equation like '3*X^2 - 6*X + 2.' What you can do is to describe a holder, like a field in FileMaker or a cell in a spreadsheet to take the place of the X. The above equation could be used as written in FileMaker if you have a number field called 'X" or in a spreadsheet written as '3*A1^2 - 6*A1 + 2,' where your variable is the number entered in field X in FileMaker or in cell A1 in the spreadsheet.

EXPONENTS: Shorthand for an exponent on a Macintosh is the carat (^) character. The example '3*X^2 - 6*X + 2' would read 'Three X squared minus six X plus 2.'

OPERATORS: Note that while in algebraic writing you can have '3X,' while in our programs this expression will return an error message. It is not understood that when you have two components of an expression without an operator between them, they will be multiplied. Therefore you would have to write '3 * X' to get the same result.

The algebraic expression '3X^2 - 6X + 2' would have to be written '3 * X^2 - 6 * X + 2.'

Converting ClarisWorks Files across Platforms

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
ClarisWorks 3.0 for Windows and ClarisWorks 3.0 for the Macintosh are essentially the same version and share the same binary file format. Because of this, files can be shared between the two platforms, retaining both data and formatting (with some exceptions). Version 1.0v1 for Windows and 1.0v4 for Macintosh can also share the same files. In all other cases, it is recommended that you upgrade to ensure that both users sharing files have the same version.

There needs to be some method in place to exchange the actual data. Apple File Exchange, PC Exchange, Access PC, and DOS Mounter all enable you to copy a file from a DOS-formatted floppy disk to a Macintosh hard disk. The other method is a network connection. Assuming that one computer can read the others data, here are the steps needed to share files between the programs.

ClarisWorks for Macintosh --> ClarisWorks for Windows
Save (or Save As) a document with a filename no more than eight characters in length, this is the character limit set by DOS. Include the suffix ".CWK" to the filename.

For example: Myfile becomes Myfile.CWK.

ClarisWorks for Windows --> ClarisWorks for Macintosh
In most cases, you will not be able to double click files that come from a PC to open them with ClarisWorks on your Macintosh. Instead, choose Open from the File menu and open the file that way.

Sharing files between different versions
It is recommended that you upgrade to ensure that both users sharing files have the same version. When this is not possible, here are a few tips:

Version 2.0 and 3.0 can directly read any file created by either Windows or Macintosh versions of 1.0. However, version 1.0 cannot open 2.0 or 3.0 files. To exchange files with someone who has 1.0 , you must do a Save As in another file format. Try RTF for Word Processing documents, SYLK for Spreadsheets and DIF or TEXT for Databases. Use EPSF or PICT for Graphics documents.

Subscriber to Microsoft Word Publisher Missing Graphics

A Publisher from Microsoft Word 5.1 contains a graphic. When you subscribe to the Edition file in MacDraw Pro 1.5, the subscriber does not include the graphic. The height of the subscriber frame will be very short; tall enough to hold a single line of text, or tall enough to hold any text that is published with the graphic. Also, the Preview in the Edition file will not show the graphic.

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.
It is not clear whether this is an issue with MacDraw Pro or Microsoft Word.

Most users of Pub/Sub will want to Publish and Subscribe in the opposite direction: publish from MacDraw Pro, subscribe in Word. There are no known issues doing this.

Rocky Mountain BASIC: No Exact Equivalent for Macintosh

I'm using Rocky Mountain BASIC on an HP. Is there a similar package for the Macintosh?

This article has been archived and is no longer updated by Apple.
The only implementation of BASIC for the Macintosh that is remotely similar to "Rocky Mountain BASIC" for the HP9000 series is Microsoft QuickBASIC. There are numerous differences, however, especially considering the machine-specific details of each BASIC. Rocky Mountain BASIC uses many commands and parameters that mean nothing to computers other than HP9000 systems. Likewise, Microsoft QuickBASIC uses Macintosh-specific commands that do not exist on other computers, as well as command syntax in traditional Microsoft BASIC style -- a style much different than that of Hewlett Packard's BASIC.

They do share the important ability to use subprograms and functions, but the method of implementing these is quite different between the two languages. Microsoft QuickBASIC would give your customer a powerful BASIC, but porting anything other than the simplest programs from Rocky Mountain BASIC will not be a trivial task -- especially with programs that are I/O-intensive because these tend to be the areas where the languages differ the most.

There are some definite benefits to using Microsoft QuickBASIC over HP's BASIC, such as advanced debugging features (breakpoints and animated tracing for source-level debugging) as well as the simpler mouse interface. Users can quickly grow accustomed to the Microsoft QuickBASIC product, while Rocky Mountain BASIC has a cruder interface and takes more time to master. Of course, you are already using Rocky Mountain BASIC, so the change in programming environment will be dramatic; to what degree depends on how familiar you are with Macintosh user interface conventions.

If you need additional information on Microsoft QuickBASIC, we suggest that you contact Microsoft directly. They should be able to provide more up-to-date information and could, perhaps, assist in deciding if their product will fit your requirements.

ClarisWorks Crashes When Importing 24 bit TIFF Images

Inserting or Opening 24bit TIFF images will crash ClarisWorks 1.0v1 for Windows. The error message is "ClarisWorks caused a General Protection Fault in module TIFF.XTD."

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.
ClarisWorks 1.0v1 for Windows cannot import 24bit TIFF images. A GPF is generated and ClarisWorks crashes. The error message is "ClarisWorks has caused a General Protection Fault in module TIFF.XTD." There is no known workaround at this time.
Published Date: Feb 18, 2012

White Bands Appearing on Page when Printing to HP 500, 550 printers

ClarisWorks 1.0v1 for Windows will produce white bands on a page when printing with CG Times printer font with the version 3.0 Deskjet drivers.

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.
ClarisWorks 1.0v1 for Windows prints blank white bands approximately every 3 inches on a page when printing the CG Times printer font to HP 500 and 550 series Deskjet printers with the HP printer driver version 3.0. The workaround is to use another font.

PICT Files Saved from Paint Environment Print with White Lines

Horizontal white lines appearing on printout may be caused by the PICT file & turning off Faster Bitmap printing.

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.
PICT files saved from the Paint environment and inserted into another application or another ClarisWorks environment may print with horizontal white lines through the graphic.

To recreate this:
1. Save the ClarisWorks Paint file as a PICT
2. Insert/Import that PICT into another software program (or another ClarisWorks environment)
3. Open Page Setup and uncheck Faster bitmap printing
4. Print

EPSF Preview Does Not Appear on a Windows Machine

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
The EPSF filter for Claris CAD and MacDraw Pro saves the preview in the resource fork of the resultant EPSF file. When you transfer Macintosh files to a DOS disk the resource fork is stripped out. Therefore, you will get no preview from those files when you open them in Windows.

The only workaround is to open the EPSF file in a program like Adobe Illustrator, which has an option to save an IBM preview with EPSF files. Once open, select that option and save as EPSF. You can then transfer the file to Windows and the preview will appear.

FileMaker Pro 2.0 for Windows Cannot print to ImageWriter II, II LQ

Although it is possible to connect to an Apple ImageWriter II or II LQ through Farallon PhoneNET PC, it is not possible to print from FileMaker or any other graphics-based application in Windows to the ImageWriter II or IILQ.

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.
Farallon Computing's PhoneNET PC network software allows you to connect to printers with either Postscript or Epson emulation. However, the Epson emulation mode only allows text printing. FileMaker Pro 2.x for Windows and ClarisWorks for Windows require the ability to print graphics, and so will not print to an ImageWriter II.

Freehand Objects Don‘t Print as Smoothly in 2.0 (DR)

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
Freehand objects from the Draw environment in ClarisWorks 2.0v1 do not print as smoothly as they do in ClarisWorks 1.0, even if the object has been automatically or manually smoothed.

Also, Freehand objects from the Draw environment in ClarisWorks 1.0 do not convert smoothly into ClarisWorks 2.0., even if the object has been automatically or manually smoothed.

Workaround: Objects drawn in ClarisWorks 1.0 can be copied and pasted successfully into ClarisWorks 2.0 documents. They are pasted as a grouped object (whether they were grouped before or not) and will print just as they did in ClarisWorks 1.0. However, if ungrouped, the objects will suffer from the same smoothing discrepancies as above.

Numeric vs. Verbose: Modem Confirmation Codes

Inability to dial using the Apple Modem Tool may be due to the modem responding with numeric confirmation codes.

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
Inability to dial using the Apple Modem Tool may be due to the modem responding with numeric confirmation codes. The Apple Modem Tool does not respond to numeric confirmation codes that are returned by the modem during initialization sequences. It only recognizes Verbose (English) commands.

Most Hayes compatible Modems can be placed in the Verbose mode by including the AT command "V1" in the initialization sequence. Many Modems have switch settings that can also make the verbose mode the default mode of the Modem.

If the Modem you are using is not capable of being initialized to respond in the verbose mode, then the Apple Modem Tool will not work and the Serial Tool must be used instead. This will require the use of user entered AT commands to initialize the Modem and dial out.

LaserWriter IINTX With Hard Drive: How Fonts Are Accessed

Can you explain how the AppleShare Print Server handles an attached hard drive on a LaserWriter IINTX? That is, if the hard drive has many fonts installed, does the print server know to get "downloadable" fonts from the hard drive, or does it go back to the Macintosh?

This article has been archived and is no longer updated by Apple.
The fonts installed on the LaserWriter IINTX hard drive appear as though they were in the LaserWriter IINTX ROM. Adobe and Apple designed the hard drive option so that the LaserWriter IINTX operates transparently, and the user can access additional fonts without having to download them with utilities.

TIP: Hidden Charting Features

Several useful charting features in ClarisWorks 2.0 that are not documented.

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.
There are several useful charting features in ClarisWorks 2.0 that are not documented:

* Hold down the Command key while clicking a text object in a chart to get a shadowed text effect that can be ungrouped and manipulated.
* Press Command and shift keys and click again on the text object and you will notice that the angle of the text shadow will change in a clockwise direction.
* Hold down the Option key and click on the legend to widen the X-axis of the chart. Press Option and Shift while clicking the legend to change the Y-axis.
* Option-shift click the title of a chart to see what your chart size would look like if you were to remove the title from the Chart.

An article regarding these hidden spreadsheet features appears in the ClarisWorks Journal (March 1994, Volume III, No. 3, page 11). The ClarisWorks Users Group published the ClarisWorks Journal and can be reached at:

Apple Ergonomic/Adjustable Keyboard Incompatibilities

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
When assigning ClarisWorks macros to function keys on the Apple Ergonomic/Adjustable keyboard, the option for function key assignment is grayed out, even when the separate number/function pad is connected. However, if you go ahead and specify a function key anyway, it will work. A future version of ClarisWorks will address the improperly disabled option.

Cursor keys on the number pad do not successfully generate VT100 cursor keys sequences with the VT102 Terminal Tool 1.0.2 and earlier. This tool needs to be revised by Apple in order to support cursor keys on the newer keyboards such as the Adjustable and the PowerBook. Apple has not announced any revision plans as of 12/1/93.

Otherwise, all keys on the number pad of the Adjustable Keyboard seem to work as expected with ClarisWorks.

Backing Up Original Diskettes

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.

1. Initialize enough blank double-sided disks for the job.
2. Insert each new disk and when you are asked to initialize it, click on Two Sided.
3. Eject the initialized disk by dragging its icon to the trash.
4. Double-click the icon of your hard drive to to open its window.

One disk at a time, follow this procedure:

1. Insert one of the original disks.
2. Drag the icon of the disk on top of the icon of the hard drive (this will copy it).
3. Eject the original disk by dragging its icon to the trash.
4. In the window for your hard drive, click once on the new folder just created.
5. Under the Edit menu, choose Copy.
6. Insert a blank, initialized floppy and click once on its icon to select it.
7. Press the Return key once (this selects the title below the icon).
8. Under Edit, choose Paste.
9. Double-click the icon of the new folder on your hard drive to open its window.
10. Under the Edit menu, choose Select All.
11. Drag any one of the now selected icons to the icon of the floppy disk (this will copy all its files onto the floppy).

12. Close the new folder's window, and drag this folder into the trash.
13. Eject the newly copied disk by dragging its icon to the trash.

Repeat the steps with each of the other original disks.

To do the actual installation:
1. Iinsert the backup disk of the Installer.
2. Double-click its icon to open it.
3. Double-click the icon of the Installer and follow the instructions.

Bold, Low-resolution Fonts Overwrite Non-bold Text (All)

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
In ClarisWorks 2.0, if you are using a low-resolution ("city-named") font while printing to an ImageWriter II, bold text will overwrite adjacent non-bold text when you select "better Graphics" and "Best printing" in the Print dialog box.

There are several workarounds, each with a negative side effect. One is to select "Better Text" in the Print dialog box, but this will probably cause margins to be incorrect (see XReferences). You could also choose "Faster printing" instead of "Best," although this will obviously diminish print quality. Yet another workaround is to change the low-resolution font to high-resolution font, but this isn't a great choice either, because the whole point of using low-resolution fonts is because they look better when printing to an ImageWriter (they're also a good choice for on-screen displays).

This problem occurs with ImageWriter drivers 2.7, 7.0 and 7.0.1.

This chart lists low-resolution fonts and their high-resolution equivalents:

Athens --- (none)
Chicago --- (none)
Geneva --- Helvetica

Monaco --- Courier
New York --- Times
San Francisco --- (you've gotta be kidding)
Venice --- Zapf Chancery

Similar problems happen when using ClarisImpact such as text being cut off at the right edge of the paper and the margins printing incorrectly.

Calculating Elapsed Time Over Several Days (DB,SS)

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.

It is not easy to calculate an elapsed time, especially if that time begins on one day and ends on another. Here's how to do it. Assuming the following fields (formatted appropriately as date and time fields):

DepartureDate
DepartureTime
ArrivalDate
ArrivalTime

The following calculation formula will yield a decimal difference between the departure date/time and the arrival date/time:

Elapsed Time (Calculation, Number result) = ROUND((('ArrivalDate'+'ArrivalTime')-
('DepartureDate'+'DepartureTime'))*24),2)

Published Date: Feb 18, 2012

Cell References not Updated Correctly after Inserting Cells (SS)

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
This has been fixed in ClarisWorks 2.1v2 and above.

In ClarisWorks 2.0v1, the cell references of any formula which contains BOTH a cell range AND a cell reference will NOT be updated correctly when cells, rows or columns are inserted within the specified range. An example of such a formula would be = B1+SUM(B3..B5).

This problem also occurs in ClarisImpact Tables or Data Charts.

Communications Document Takes a Long Time to Open (CM)

Since the scrollback log of ClarisWorks 2.0 is set to "limited by memory," files can grow in size and take a long time to open. There are two options for dealing with this.

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.
ClarisWorks 2.0 sets the scrollback log to "Unlimited." This is convenient for storing as much of a session as possible. However, if you use the same document to log on again and again, the scrollback log will grow in size. This both increases the file size and the time required to open the document. For example, a 300K document could take up to 30 seconds to open depending on the model of Macintosh.

There are several options for dealing with this:

1. After you are finished with a session, and have reviewed or retrieved what you needed from the scrollback log, choose Clear Saved Lines from the Session menu to clear the scrollback log. Note that all data in the scrollback will be lost, so be certain before doing this.

2. Set up a communications document for each service you log onto with all the proper settings and when saving it, choose ClarisWorks Stationery from the File Type popup menu. When you open the document, a new Untitled clone of the document will be opened, leaving the original untouched for your next session.

3. If you don't need a large scrollback log for your sessions, decrease the scrollback log size in the Preferences dialog.

Data Missing from Capture File (CM)

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
There are some situations where turning on CaptureFile does not save all the information you see during your session. Here are some pointers for making sure all the information gets saved:

Session Menu
"Save Lines Off Top" controls the saving of text to the capture file when "Capture from Port" is selected in Preferences. Be sure that this command is checked in order to capture the text.

Preferences
Data capture control is only enabled when "Capture from Port" is selected in the Preferences Communications window (in the Edit menu). The command "Save Lines Off Top" has no effect on capture if "Capture from Screen" is selected in the Preferences menu. Note that "Save Lines Off Top" will always control what goes to the Log or Scrollback window.

"Capture from Screen" is the default in CW 1.0. "Capture from Port" is the default in CW 2.0.

TIP: To pause a capture rather than turning the mode on and off, hold down the option key while selecting the Session menu. The Stop capture menu item will say Pause Capture instead. To resume capturing, hold down the option key and select Resume Capture from the Session menu.
Published Date: Feb 18, 2012

Decreasing Scrollback Log Size Discards Data in Log (CM)

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.

In the Preferences dialog, you can set the size of the scrollback log. The default is "Unlimited." Decreasing the size of the scrollback results in the loss of any data currently in the scrollback above the size specified. ClarisWorks does not provide a warning that data will be lost.

Published Date: Feb 18, 2012

Eliminating Duplicate Records (DB)

Using a spreadsheet document, it is possible to automatically identify duplicate records in a ClarisWorks database.

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.

Although ClarisWorks has a sophisticated database environment, there are certain useful features usually found only in dedicated database programs like FileMaker Pro. One of these useful features is the ability to identify duplicate records.

However, ClarisWorks has a significant advantage because of its modular document structure: you can look at database data in the spreadsheet environment and make direct comparisons between records, which are treated as separate rows in the spreadsheet. This method allows you to find and eliminate duplicates from your ClarisWorks database.

A strong understanding of ClarisWorks database and spreadsheet creation and usage is necessary to implement this article.

1. From a copy of your file choose "Show all Records" from the Organize menu. Sort the database by the field which has the duplicate values. (If you are searching for duplicate addresses, for instance, you would sort by Address.)

2. Define a the following field in your database:

DUPLICATECHECK (Number)

3. Choose Save As... from the Edit menu. From the Save as... dropdown menu choose DIF. Name the file DATA.DIF. Click the Save button. You have now saved a data file for use later. Now Delete all of the records in the copy of your file by using the Clear command in the Edit menu.

4. Use the Open command to create a new spreadsheet document using the DATA.DIF file just created.

5. In the Spreadsheet, click in row 2 of the DuplicateCheck column and enter the following formula:

=IF(AND(A2=A3,A1<>A2),1,IF(AND(A2<>A3,A2<>A1),2,0))

6. Use the Fill Down command to fill the formula down for as many records as you had in your database.

7. Choose Select All from the Edit menu to select your entire spreadsheet then choose Copy from the Edit menu.

8. Switch back to the empty DB document copy (use the View menu) and choose Paste from the Edit menu.

9. Use the Find command to find all zeros in the DuplicateCheck field.

10. Choose Clear from the edit menu. Your duplicates will be gone.

Explanation:
To identify duplicates, you need to be able to directly relate information between two records in your database. That is not possible in the Database document itself, but we can use a spreadsheet formula to perform that comparison for us, because any cell in the spreadsheet can be referenced from any other cell.

In this case, you export the information in the DIF format so that you can see the field names below the column titles. The formula is designed to compare the entries in column A for unique entries: if you need to compare a different field, you can substitute that column for column A in the formula. If you need to compare more than one field, you can use the Concat function with the previous formula in the following manner:

IF(AND(Concat(A2,B2)=Concat(A3,B3), Concat(A1,B1)<>Concat(A2,B2)),1, IF(AND(Concat(A2,B2)<>Concat(A3,B3),Concat(A2,B2)<>Concat(A1,B1)),2,0))

Both formulas always result in either the value 0, 1 or 2. The number 2 is used for entries in your database that are already unique. The number 1 is used for entries in your database which are the first in a series of entries (the first duplicate in a group of duplicates). The number 0 is used to identify the second and all subsequent duplicates in a group of duplicates.

Exporting Database Data with Styles

Since you can select records in ClarisWorks databases and copy them , it is possible to export data with Fonts and Styles intact.

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.
ClarisWorks exports data using the Save As command and supports several standard database formats. All of them are plain text formats which strip the different fonts and styles you apply to text in fields.

However, since you can select records in ClarisWorks databases and copy them, it is possible to export data with Fonts and Styles intact.

1. Select a record by clicking outside of a field and then Select All
2. Copy
3. Create a new ClarisWorks WP document, and Paste.

Note: To control which fields get copied and in what order, create a standard layout with all the fields and re-order them, deleting any you don't want copied.

Formula Displayed in Cell Instead of Value

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
If a cell diplays a formula instead of the value it is supposed to be calculating, it is probably because:

1) The formula is not preceded by an equal sign ("=") or

2) The option "Display Formulas" is checked in the Display dialog, under the Options menu (Display Formulas is not an option in ClarisImpact).
Published Date: Feb 18, 2012

Gradients won‘t Print at Full Resolution

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
If you publish a gradient and subscribe to it in another ClarisWorks document, the subscriber will print the gradient at 72 dpi instead of the full resolution of the printer.

Publish & Subscribe transports objects through the system clipboard, causing the special hinting of a ClarisWorks gradient to be lost.

This also occurs when you copy a gradient, paste it into the Scrapbook, copy from the Scrapbook and paste back into ClarisWorks. In fact, ClarisImpact will not even print the gradient within the confines of the object.

Copying and pasting without going through the Scrapbook retains the full quality of the gradient.

Greater Zoom % Required for Accurate Display at Resolutions above 72 dpi (PT)

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
Pixels in a 72 dpi Paint document or frame are displayed very accurately since most Macintosh monitors have a 72 dpi resolution. For Paint documents with greater resolutions, ClarisWorks can only approximate the display of the pixels.

Increasing the resolution of a paint Document/Frame decreases the size of the drawing area and the images contained in that drawing area. Basically, each pixel is reduced in size. Since most screens only display 72 dpi it is necessary to increase the zoom level to 200% or greater to accurately place higher resolution pixels. In general, greater resolutions require greater Zoom percentages.

Here is an easy example to help understand the issue:
1. Open a new Word Processing document
2. Create a Paint frame
3. Set the Paint frame to 144 dpi resolution
4. Use the Pencil or Line tool to draw a horizontal line all the way across the frame
5. Increase the Zoom until you can see that the line does not actually reach the edge of the frame

Now try the same scenario but Zoom to 200% before drawing the line across the frame. This time you will be able to draw the line all the way across the frame.

Resolutions and recommended Zoom percentages:
72 dpi ---> 100% Zoom
144 dpi ---> at least 200% Zoom
288 dpi ---> at least 400% Zoom
300 dpi ---> at least 800% Zoom
360 dpi ---> at least 800% Zoom

Green won‘t Print to an ImageWriter II with System 7.x (All)

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
When printing from ClarisWorks 2.0 or ClarisImpact to an ImageWriter II with a color ribbon and the 7.0 or 7.0.1 ImageWriter driver, some shades of green may print as black. This happens with all Print dialog box settings: better text, better graphics, best printing, and faster printing.

The shades of green that do print from the basic, installed Claris Color Palette, are the 5th through the 7th colors in the green column (see Figure 1).

The ImageWriter 7.0 driver is supplied with System 7.0 and 7.0.1; the ImageWriter 7.0.1 driver is supplied with System 7.1.

There is no workaround. The ImageWriter 2.7 driver, supplied with System 6.x, prints the green fine at all settings.

Figure 1: The green colors in the basic palette that print.

Helvetica, Condensed, Full Justified not Printing Justified (All)

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
If you are running System 7.1, you may notice that a ClarisWorks Word Processing document or a ClarisImpact Report document that has the following attributes does not print justified:

1. Font --> Helvetica
2. Style --> Condensed
3. Alignment --> Full Justified
4. Helvetica TrueType and screen fonts are in a common suitcase in the Fonts folder

Workaround:
Remove all TrueType and screen fonts from the Helvetica Suitcase so that they are loose in the Fonts folder. TrueType fonts can be distinguished from screen fonts by the triple 'A' on their icon.

NOTE: When installing System 7.1, the TrueType and screen font versions of Helvetica are combined in a common suitcase.

Image Splits or Disappears when Using Perspective or Distort (PT)

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.

It is possible for an image to split, dissapear or even move out of the selection area when Distort or Perspective is applied. This appears to happen only if an image is changed slightly. In other words, moving the selection handles greater than 2 to 3 pixels will work fine. Anything less and the image will probably change improperly.

The only solution if an object changes improperly is to use Undo.

Japanese and Chinese WorldScript Incompatibility: Bold Vertical Lines in Font Menu (All)

ClarisWorks 2.x and MacWrite Pro are not compatible with World Script, causing bold vertical lines in the font menu when using the Japanese or ChineseScript.

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.
Q: When I run ClarisWorks or MacWrite Pro after installing the Japanese Language Kit, the Fonts menu has only bold vertical lines instead of the names of the fonts.

A: ClarisWorks and MacWrite Pro are not compatible with World Script. You have two options:

1. Remove all the Language Kit extensions from the extensions folder, or use an extension manager utility to disable them. Since you will lose your WorldScript features with this method, choice number 2 is a better option.

2. Workaround:
- Restart will all extensions off by holding down the Shift Key.
- Trash the Claris Fonts file that's in the Claris folder in the System Folder.
- Launch ClarisWorks or MacWrite Pro; this will create a new Claris Fonts file.
- Locate the file from the Finder. Get Info on this file and Lock it.
- Restart normally. The Claris fonts menu will show all available font names (though the names will be in the Chicago font).

Keyboard Appears Locked, Every Key Causes Beep - Easy Access and the Return Key (WP)

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
In a Word Processing document, if you hold down the Return key for more than four pages, Slow Keys from Easy Access will activate itself. This can actually happen in any application that will accept the return key held down.

When Slow Keys activates, it may appear that you are no longer able to use the Keyboard. Actually, you still can, but you have to hold a key down for a few seconds before it appears.

The solution is to open the Easy Access control panel and turn Slow Keys off.

NOTE: Rather than using a bunch of return characters to move to a next page, use the Insert Break command in the Format menu to insert a page break character. Pressing the Enter key does the same thing.

Make Default in Preferences doesn‘t Remember Pathname of Loaded Palette (All)

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.

ClarisWorks 2.0 and ClarisImpact allow the creation of Preference defaults without saving a stationery document. One of the Preference choices is Palettes and one of the options is Load Editable 256 Color Palette. However, Claris programs will not remember the pathname for the palette when making a default. Claris programs will remember that an editable 256 color palette has been selected, but not the specific palette. Claris programs simply revert to the standard palette.

Workaround:
Use a stationery document to remember the Preference default for Editable 256 Color Palette. Stationery documents settings override all defaults set through the Preferences.

NOTE: Make Defaults will remember the pathname to a palette in the document from which you set the default since the pathname is stored in the document.

Margins Incorrect when Printing to ImageWriter II (WP)

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
When printing a word processing document to an ImageWriter, the right hand margins may appear to be larger than anticipated. This is especially true when "Better Text" is selected in the Print dialog box (change to "Better Graphics"). This is caused by the way the ImageWriter prints text. (NOTE: ClarisWorks version 2.1v1, 2.1v2, and 2.1v3 did not have a Better Text or Better Graphics feature. ClarisWorks 2.0 and 2.1v4 do.)

A workaround for this behavior is to set the right hand margin to 0". This adjustment can be made in the Document section under the Format menu. Turning off "Show Margins" is also recommended. By changing the right hand margin, the difference in pixel width is compensated for and the right hand margin will be roughly equivalent to that of the left. This is under the assumption of 1" margins and an 8 1/2" X 11" page.

If you create a stationery document with these margins, you can avoid having to set them each time you open a new ClarisWorks WP document. See page 2-20 of the User's Guide for details on how to create a default stationery file.

Why this happens:
The text is made up from a series of "dots" (pixels) which when printed closely to each other make up the solid text of the printed output. The pixels on the Macintosh screen are square, while the pixels in the ImageWriter are rectangular. The difference in the pixel width translates to text that is more compact and therefore takes up less width across the screen.
ClarisWorks uses the square pixels in its calculations for the text frame width, which is what determines the amount of text that is displayed on each line. Currently, there is no method for ClarisWorks to compensate for the difference in pixel width and its effects on the output.

This printing problem occurs with ImageWriter drivers 2.7, 7.0 and 7.0.1. It does not occur with ClarisWorks 1.0.

If a ClarisWorks 2.0v1 (Mac) WP document is printing to an ImageWriter II and the printed text looks condensed or scrunched together, this may be due to the margins being incorrect as discussed in this article.

We have one report that installing a software package called "BetterWriters v1.0.1" from GDT Softworks fixes this problem.

Apparently, this software package also fixes a slow-speed printing problem found while using SuperLaserSpool.

Claris Tech Support has not tested either of these fixes.

Mortgage Analyzer Sample File Miscalculates Yearly Totals (SS)

Here's how you can personalize the template to meet your specific needs!

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.
Under certain circumstances, this Mortgage Analyzer template file will miscalculate the yearly totals.

Here's how you can quickly correct the problem AND give yourself as many months calculated as you may need !

1. Open the original Mortgage Analyzer file from the Samples folder.

2. Drag through cells E16 through J17.

3. Under the Options menu, select Unprotect Cells.

4. Click on cell E16 and change the formula in it so that the 12 now reads D5 instead. Press Enter.

5. Go down to cell E17 and change the formula in it so that the 12 now reads D5 instead. Press Enter.

6. Click on cell I17 and change the formula in it so that the E4 reads E6 instead. Press Enter.

7. Click on cell J17 and edit it so that F4 (near the end of the formula) reads F6 instead. Press Enter.

8. Drag through cells E16 through J17.

9. Under Options, select Protect Cells.

10. Now, drag through cells B17 through J17 and also drag down as far as you need the months to be calculated. (Too far is no problem, you can delete unwanted formulas later.)

11. Under Calculate, select Fill Down. Be sure AutoCalc, under the Calculate menu, is checked.

Save the file for future use before adding specific data into it.

Objects Cropped when Resolution of Paint Frame is Changed

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
When changing the resolution of a Paint Frame, objects close to the right edge of the Paint Frame may be cropped.

How to recreate:
1. Create a Paint Frame.
2. Place an object close to the right edge of the frame.
3. Change the resolution to 300 dpi.
4. Notice that the frame is not large enough to show the entire object.

Solution:
1. Select the Arrow tool.
2. Click once on the Paint Frame.
3. Notice that the Paint Frame has selection handles on each of the four corners.
4. Click and hold down on the lower right selection handle and drag until the frame is big enough.

Opening 1.0 Documents in 2.0 (CM)

The message: "Could not configure connection tool" is the result of a new version of the Apple Modem Tool which doesn't properly open documents created with the older version.

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.
After upgrading to ClarisWorks (CW) 2.0, you may get the following message when opening 1.0 Communications documents:

"Could not configure connection tool."

The document will then open but the phone number will be missing. This message will only occur with documents configured with the Apple Modem Tool. This is due to the fact that CW 2.0 automatically updates the Apple Modem Tool to Version 1.1.1. The new tool will not properly open CW documents created with the older version. Trying to open up documents with CW 1.0 after CW 2.0 will result in the same error message.

The solutions are:

1. Reenter the phone number, check the other settings and save the converted document. The warning will not appear the next time you open the document.

2. Replace the new Apple Modem Tool (in the Extensions Folder in the System Folder) with the older tool from the ClarisWorks Communications Folder on the ClarisWorks 1.0 Communications Disk.

Note: Using the older version may result in less stable communications. The new version contains several enhancements.

Paint Document File Size is Greater than PICT or Draw (PT)

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
Inserting a PICT file into a Paint document and saving will result in a file which is larger than the original PICT file. Copying and pasting from a draw document to a paint document will have a similar result.

PICT is object oriented whereas the Paint environment saves in bitmaps. Likewise, ClarisWorks drawing files are object oriented. Object oriented files can store the description of each object in the file using very little RAM or disk space. Conversely, bitmap environments, like ClarisWorks Paint files, store every dot (pixel) of information. Thus, PICT and ClarisWorks draw files are usually smaller, since it takes less memory to store the description of say, a square, than it takes to store all the dots in a bitmap that look like a square.

Workaround:
The Paint environment allows you to change the resolution and bit depth of a document or frame. Standard settings are 72 dpi and pixel depth of 256. If your painting contains fewer colors, then change the pixel depth accordingly. For example: a black and white painting saved as 72 dpi and 256 depth was 305k, resaved as 72 dpi and Black & White depth was 40k.

Selecting Landscape doesn‘t Change Orientation of Paint Document (PT)

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.

Like most Paint programs, the ClarisWorks 2.0 Paint Environment will not switch to landscape (wide) orientation simply by selecting Landscape from Page Setup. An additional step is needed. Choose Document from the Format menu and change the Pixels Across and Pixels Down to reflect the correct measurements. Dimensions for U.S. letter are:

Portrait (tall) = 468 across & 648 down
Landscape (wide) = 648 across & 468 down

NOTE: To create a full letter size page, it is necessary to increase the default memory allocation to ClarisWorks. See the User's Guide for recommendations on memory allocations for various sizes and resolution and depth settings of Paint documents.

Shear, Slant & Perspective Only Moves Image in One Direction or on one Axis (PT)

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.

It is possible to Slant, Shear or use Perspective on an image vertically or horizontally but not both ways at once. The direction you move the handle first is the only direction you will be able to shear unless you restart the process. The simplest method for shearing both directions on one image is:

1. Select the image you want to shear
2. Choose Shear from the Transform menu
3. Drag one of the handles up or down
4. Now try to drag any handle left or right (notice that this is not possible)
5. In order to shear horizontally, click once outside the image (notice that the image is still selected but that the handles are gone, clicking twice deselects the image)
6. Choose Shear from the Transform menu again
7. Now you can drag left or right
8. Repeat steps #5 - 7 in order to switch shearing directions again

There is no keyboard equivalent to change shear directions.

Specifying Field Order and List for Export/Save As (DB)

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.

Choosing Save As and specifying Text file type in ClarisWorks (versions 1.0-4.0) exports all records and all fields in the order fields were created. To control the choice and order of fields on export from ClarisWorks, create a layout just for exporting with fields ordered from top to bottom and use cut and paste instead.

1. Create a layout with fields arranged in the exact order you desire
2. While in Browse mode, select/hilite all the records for export
3. Choose Copy from the Edit menu
4. Open a new Word Processing document
5. Choose Paste from the Edit menu
6. Choose Save As... from the File menu and save as a Text file. The result is a tab-separated text file.

Trading SYLK files with Excel Causes an Out of Memory Error in Excel (SS)

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
When transferring SYLK files between Excel 4.0 and ClarisWorks, there exists a situation where Excel will get an out of memory error message.

To reproduce:

1) Create a simple spread sheet in ClarisWorks 1.0 or 2.0 with a couple cells, and then export it out as SYLK. Call this file "F1".

2) Open "F1" in Excel 4.0. Then save the Excel file out as SYLK. Call this file "F2".

3) Open the "F2" file in CW and then save it out one more time as SYLK. Call this file "F3".

4) Open "F3" in Excel. You will get an out of memory error message.

SOLUTION
To work around this problem, use Excel 3.0 as the file type by which you transfer files between ClarisWorks and Excel 4.0.

Translated Excel and Microsoft Works Spreadsheet Files Grow in Size

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
Sometimes, translating Microsoft Excel or Microsoft Works spreadsheets with ClarisWorks results in file sizes greater than the original file. In one case, a 20K Excel file grew to 180K in ClarisWorks.

The most likely explanation is that an entire row or column has been formatted in Excel or Microsoft Works, which inserts formatting information in hundreds of cells. When ClarisWorks translates this spreadsheet, it must create a document with many more rows and columns than actually contain useful data, resulting in a larger file size since ClarisWorks stores this data differently than Excel and Microsoft Works.

If you find this to be the case with any of the spreadsheets you translate, select the cells in the original application which have data and copy and paste into a new spreadsheet in that application. Save the file and translate it into ClarisWorks. This will usually result in a file size that is even smaller than the original spreadsheet file.

Why ClarisWorks may Switch to XMODEM When Attempting to Transfer a File With MacBinary Mode (CM)

If the file transfer method switches from MacBinary to XMODEM, and/or if your downloaded file has a generic icon and isn't openable by double-clicking, try the suggestions in this article.

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.
Sometimes when downloading a Macintosh file using the XMODEM file transfer tool, the file refuses to transfer in the MacBinary mode and uses Straight XMODEM instead.

If this happens, it's probably because the file header is corrupt or the file was uploaded improperly. Most likely the BBS from which you are downloading is DOS Based. The reason that the the transfer switches to straight XMODEM is that a file can only be downloaded as a MacBinary file if the transfer protocol recognizes a proper Mac Header (file type and creator).

If you download the file anyway, you may be able to open the resulting generic file with a word processor, but the file is probably not a text file. What is downloaded is a generic file, which results in non-printable characters to be filtered out when opened with a text processor.

Instead, try just using straight XMODEM and then use some utility that allows changing of the file type and creator (such as ResEdit or Disktop) and set it properly. If you cannot find out the proper file type/creator, then the file will have to be reuploaded properly or you will not be able to use it.

Chaining Macros with Function Keys Error

Chaining Macros with Function Keys will not work correctly

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.

Problem:
When attempting to chain two macros assigned with function keys (F7, F8) together by means of a third macro, a dialog box should appear after recording stating "There was nothing to record." Dialog does not appear.

Example:

1. Create two macros and assign one macro to the function key F7 and the other to the function key F8.
2. Bring up the Record Macro dialog box and begin recording.
3. Press the F7 and then the F8 function keys.
4. Stop Recording.

Solution:

This will be fixed in the next version.

Text Ruler Disappears

When you click outside the text frame, the text ruler disappears

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.

Problem:

Text ruler disappears when you click outside the text frame.

Example:

1. Create a new graphics document.
2. Select the Text Tool and type in a letter.
3. Select the Text ruler from the Format/Rulers dialog menu.
4. Click outside the text frame.

* Notice that the ruler disappears (zoom in or zoom out and it reappears).

Explanation:

The ruler will try to draw flat when it is disabled, except in cases where the current document type is not known, in which case it will erase the tab well area. When you first display the ruler it knows what the current data set is and draws with the flattened button look. When you click out of the text frame it is in a transition state and just erases.

Can‘t Find by Calculated Dates Without Using the TEXTTODATE Function (DB)

If you can't find by a date, you probably need to use the TEXTTODATE function in the calculation formula.

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.
When specifying a date result in a calculation field, it is not enough to simply choose Date from the Format Result popup menu. You must also surround the specified date with quotes and the TEXTTODATE function. Using the incorrect formula will return a date which looks correct, but does not result in a successful Find.

Incorrect Date (Calculation, Date result) = IF('Period'="Q1&2","1/1/93","6/1/93")

Correct Date (Calculation, Date Result) = IF('Period'="Q1&2",TEXTTODATE("1/1/93"),TEXTTODATE("6/1/93"))

The NOW Function
The TEXTTODATE function does not work with the NOW function, causing an ERROR result. Therefore, it is not possible to find a date in a calculation field with the formula: NOW() which is often used as a way for auto-entering the date a record is created.

ClarisWorks 2.0 offers Entry Option features which include auto-entering the creation date into a date field, so the NOW function method is not required.

In ClarisWorks 1.0, a workaround is to create an additional calculation field called DateFind set to return a date result using the formula:

DateFind (Calculation, Date Result) = TEXTTODATE(DATETOTEXT('NowCalcFld'))

Outline Styles Not Preserved When Not in Outline View (WP)

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.

In the ClarisWorks 2.0 word processing environment, when using Outline View, be aware that styles applied by the Outline Format will not be preserved when you deselect Outline View; text created while in Outline View will revert to Helvetica, regardless of any other style changes you've made in your document - even if they are the document's default.

For example, if you are typing a document with Helvetica font and you select Outline menu, Outline View, Harvard Format , your outline will be displayed in New York - which is the typestyle that the Harvard format uses. But once you exit Outline View, your text will become Helvetica, because that New York typestyle was applied by the Outline feature.

If you are working with a document that has, say, Palatino as its default typestyle, and you switch to Outline View, any text you've already typed will show up in Palatino in the Outline. Text you type beyond that will appear in whatever typestyle is defined for that Outline format. Once you exit Outline View, any text that was typed in Palatino format before you entered Outline View will remain Palatino; any text that was styled by the Outline format will become Helvetica - even though Palatino is the "default" for your document.

If you are in Outline View and you manually change a typestyle by selecting text and choosing another typestyle, that style will be kept when you leave Outline View. This reversion to Helvetica only happens with typestyles that are applied by the Outline Format itself.

There is no workaround, other than using Helvetica as your default typeface.

Converting Time to a Decimal Value (SS, DB)

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
To convert time to a decimal value where 2:45 would equal 2.75, use the formula:

HOUR(A1)+MINUTE(A1)/60

This extracts the hour and adds it to the minutes divided by 60 to convert minutes to a decimal.

Increasing the Spacing Between Footnotes

Footnotes are automatically formatted as single spaced, with no extra lines between them. For clarity of reading, you may want to add a blank line between each footnote.

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.
The spacing between individual footnotes maybe be increased by simply adding an extra paragraph return at the end of the previous footnote.

EXAMPLE:

[BEFORE]

_____
1 Lorem ipsum dolor sit amet, consectetuer adipiscing elit, sed diam nonummy nibh euismod tincidunt ut laoreet dolore magna aliquam erat volutpat.«EXTRA RETURN IS TYPED HERE, AT END OF FOOTNOTE»
2 Ut wisi enim ad minim veniam, quis nostrud exerci tation ullamcorper suscipit lobortis nisl ut aliquip ex easden commodo consequat.«ANOTHER EXTRA RETURN IS TYPED HERE»
3 Duis autem vel eum iriure dolor in hendrerit in vulputate velit esse molestie consequat, vel illum dolore eu feugiat nulla facilisis at vero eros et accumsan et iusto odio dignissim qui blandit praesent luptatum zzril delenit augue duis dolore te feugait nulla facilisi.

[AFTER]

_____
1 Lorem ipsum dolor sit amet, consectetuer adipiscing elit, sed diam nonummy nibh euismod tincidunt ut laoreet dolore magna aliquam erat volutpat.¶

2 Ut wisi enim ad minim veniam, quis nostrud exerci tation ullamcorper suscipit lobortis nisl ut aliquip ex easden commodo consequat.¶

3 Duis autem vel eum iriure dolor in hendrerit in vulputate velit esse molestie consequat, vel illum dolore eu feugiat nulla facilisis at vero eros et accumsan et iusto odio dignissim qui blandit praesent luptatum zzril delenit augue duis dolore te feugait nulla facilisi.

White Text Prints about One-Half Character to the Right of its Apparent Position

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.

White text (any size, any font) prints about one half character to the right of its expected position based on screen placement. The actual displacement is proportional to the font size, but is usually equivalent to one half character at any given font size.

This effect may be seen on any printer, while printing either black & white, color or greyscale.

Workaround: the only workaround for this problem is to intentionally displace the text object on screen until it prints in the proper location.

Styles Don‘t Print After Saving as EPSF

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
Certain printer-resident fonts such as Symbol and Zaph Dingbats do not have an italic face. Applying an italic style to them will make them appear and print as italic. However, when a document with these fonts formatted as italic is saved as an EPSF file, reopened in MacDraw Pro and printed, the fonts appear italic but do not print as plain. This was tested with MacDraw 1.5v2 and EPSF translator 1.0v3. To duplicate the problem:

1. Create a new document.
2. Create a text object in a font that is resident on your printer (e.g. Symbol). Leave it as Plain Style.
3. Duplicate it or create a new text object in the same font. Choose Italic from the Style menu.
4. Choose Save and select EPSF from the file type pop-up menu. Name the file and Save.
5. Choose Open from the File menu and open the file you saved.
6. Notice that the font appears as italic on screen but prints as Plain text to a LaserWriter.

ClarisWorks 1.0 Macintosh Text Translator

MacWrite Pro 1.0v4 includes a ClarisWorks 1.0 Macintosh Text Translator. This translator allows you to transfer word processing documents between MacWrite Pro and ClarisWorks 1.0 for the Macintosh.

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.
This translator enables MacWrite Pro to open and save ClarisWorks 1.0 Mac word processing files. Headers, footers, margins, columns, paragraph formatting and fonts are all retained. ClarisWorks frames are not translated, so graphic, spreadsheet and text frames will not appear in the resulting MacWrite Pro document. Likewise, MacWrite Pro frames such as text, pictures, notes and tables are not translated when saving as ClarisWorks 1.0. The one exception is anchored or in-line graphics which are translated successfully.

To use this file, place it in the Claris Translators folder which resides in the Claris folder in the System Folder.

YOU MAY ONLY USE THE TRANSLATOR WITH AUTHORIZED, LICENSED COPIES OF MACWRITE PRO UNDER THE TERMS OF THE ENCLOSED LICENSE AGREEMENT.

This translator is available from America Online, CompuServe, AppleLink, the Claris BBS.

Combining Two or More Fields into a Single Field- Concatenations Explained (DB)

Adding fields and text together through concatenation

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.

'Concatenation' is a simple concept. It means to link things together.

For example, if you have a first name Louis and a last name Armstrong and you concatenate them, you get Louis Armstrong. Actually this particular concatenation has a third element - the space between the first and last names.

Claris products use the ampersand (&) to concatenate fields and/or text. Notice in the examples below that text (as opposed to numbers, field names, dates or functions, etc.) are surrounded by quotation marks ("). To get the space between the first and last names, we concatenate them with a space enclosed in quotation marks.

Given that you have fields First Name and Last Name, here are formulas that will concatenate them for you. [for clarity, the caret (^) has been used to show where you should type a space]

FileMaker
Full Name (calculation, text result) = First Name & "^" & Last Name
This means, 'link together the entry in the First Name field, a space, and the entry in the Last Name field.'

ClarisWorks
Full Name (calculation, text result) = 'First Name' & "^" & 'Last Name'

(Notice that in ClarisWorks, the field names are surrounded by apostrophes)

In ClarisWorks, there is also a concatenation function built in. The following formula produces the same results as the above two:

Full Name (calculation, text result) = Concat('First Name',"^",'Last Name')
This means, 'link together the following items: the entry in the First Name field, a space, and the entry in the Last Name field.'

To go to the next line in FileMaker add & "¦" to the concatenation where you want the line to break. However, in ClarisWorks, using either method above, you cannot place a carriage return within the concatenation. In addition, ClarisWorks calculation fields do not word wrap to a second line. They will only use one line one line, so any calculation result which continues beyond the width of the field will be cropped.

Demo Disk - What Is Included, Installation, General Use

Typing Install at a dos prompt will run the demo's install program, and more information is contained in a file called readme.wri that is installed with the demo program in the CWDEMO directory.

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.
The ClarisWorks 1.0 for Windows Demo Disk contains two files: Install.bat and demo.exe. Installing the demo is handled by the install.bat file. This runs a DOS installation program, so the install.bat can be run from inside Windows or from a DOS prompt.

1. Exit Windows, so that you see a Dos prompt
2. Insert the ClarisWorks Demo disk in either the A or B drive
3. Type A: or B: depending on which drive the demo disk is in, and press enter
4. Type "Install" and press enter

If a "Not ready reading drive" error occurs after typing Install, check to see what drive the disk is in. If it is in the B: drive, you must type B: and press enter, otherwise DOS will look at the wrong disk drive and produce the error "Not ready reading drive".

After the files are installed, you will have a CWDEMO directory with the demo program, sample files, and a Claris directory inside the CWDEMO directory with picture filters and other auxiliary files. Double - clicking on the CWDEMO.EXE will run the demo version of ClarisWorks. Also in the CWDEMO directory is a file called README.WRI that has instructions on installation and operation of the demo, and there is a ClarisWorks file called PRINTME.CWK that has instructions on creating some example documents with ClarisWorks.

The demo program's install routine does not create an icon for the ClarisWorks 1.0 for Windows demo, so one must be created by hand.

1. Start Windows, if you are still at a Dos prompt
2. In Program Manager, pull down the File menu and select New
3. Choose Program Group, and name the group "ClarisWorks Demo"
4. From the File menu, choose New and select Program Item
5. Type C:\\CWDEMO\\CWDEMO.EXE in the Command Line box

Exchanging ClarisWorks Database Files with FileMaker Pro 2.0

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.

When you need to transfer information between a ClarisWorks and a FileMaker database, use the DIF format. This format preserves the field names, making it much easier to merge files. When opening a DIF file that was exported from FileMaker Pro 2.0, ClarisWorks automatically creates the fields necessary to accommodate your data. Each field has the same name as it did in FileMaker Pro and uses Text as its field type.

If you want to add FileMaker Pro data to an existing ClarisWorks database, you can follow these steps:

1. Export the information from FileMaker Pro using the DIF format.

2. Use the ClarisWorks Open command to import the DIF file. A new ClarisWorks database will be created using the field names in the DIF file. All field types will be Text.

3. Select the records to be moved and copy them.

4. Open the database where the information belongs, and paste. The information will be added to the database, with fields matching up automatically.

Since ClarisWorks matches field names while pasting, this makes it easy to exchange information between ClarisWorks and FileMaker Pro databases on a consistent basis.

How to Add Borders to Report Headers and Footers

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
Claris Resolve shares some technology with Wingz by Informix. In Wingz, you can use menu commands to place borders around the report header and footer. Although Claris Resolve doesn't give you menu commands to accomplish this, you can use two script commands instead.

To use these commands, just type them into the entry bar and press Command-Return. This tells Resolve to consider your entry as a command to be executed immediately, not a cell value or formula.

To turn on header borders, type:

select report header single line border

To turn off header borders:

select report header no line border

You can substitute footer for header and double for single if you like.

How to Chart Discontinuous Ranges

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
Sometimes you want to consolidate values from different parts of your worksheet into a single graph. Claris Resolve doesn't let you directly select and chart discontinuous ranges. But here are two ways to work around that limit.

Close neighbors

If your series are within a couple rows or columns of each other, you can graph the whole block and take out the ranges that shouldn't appear on the graph:

1. Select the entire range, including the area you don't want included, and chart it.
Notice the chart legend contains a marker for all series, including the ones you don't want used.

2. Double-click the marker for any series you don't want on the chart. This will present the Series dialog box.

3. Click on the Delete button to remove the series from the chart (this will not affect the data on the worksheet).

4. Repeat steps 2 and 3 for each unwanted series.

Far-flung ranges
If your ranges are widely separated on the worksheet, you can chart one series and manually add the others:

1. Select the first contiguous group of data and chart it.

2. Double-click a the series marker in the legend of the chart. The Series dialog box appears.

3. Click the Duplicate button. This will create an exact duplicate of the selected series.

4. Double-click on the duplicate series item to bring up the Series dialog box.

5. Change the data range to the next range of data you want charted.

6. Adjust any symbols or colors as needed.

7. Click the OK button.

8. With the duplicate series still selected, choose a new color from the fill color palette in the tool bar.

9. Repeat steps 2 through 8 for each new series you want to add to the chart.

How to Resize Rotated Items

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
Rotated objects do not resize the way other objects do. When resizing, ClarisCAD uses the non-rotated position of the object, adjusts it, then reapplies the rotation angle. For example, if you widen a group containing a rectangle rotated 90 degrees, the rectangle will actually end up taller after the resize.

If you need the object to resize in proportion to other objects in a group, try the following:

1. Save out the group as a PICT file, then open it back into ClarisCAD. The object will then resize as expected.

-OR-

2. Ungroup the objects, select any rotated polygons and squares, and choose Unjoin from the Arrange menu. This has the effect of making ClarisCAD "forget" the objects were rotated. To reassemble the unjoined polygons, shift select each line that forms a polygon, and when all parts of a polygon are selected choose Join from the Arrange menu. If you now re-group all previously grouped objects, they should resize as expected.

Out of Memory Message When Importing

How to increase the memory assigned to an application

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.
If the error message "Out of Memory when importing document" appears when importing a document, the memory reserved for the application may not be large enough to accommodate the imported file. Generally this error message occurs with large TIFF or PICT images, though it can occur with any large file. Here's how to increase the application's memory allocation:

1. Quit the Application and return to the Finder.
2. Go to the actual application program icon (not a document created in the application) and click once to select it.
3. From the File menu, select Get Info.
4. Increase the memory in the Application Memory Size box at the bottom of the Get Info window. If you are using System 7.1, increase the Preferred Size. Increasing memory by 500, to 1000K, should be enough to import most images. The more color depth and the larger the image, the more memory will need to be increased.

Sometimes, increasing memory allocation will not fix the problem. The next step is to find the file "XTND Translator List" and delete it. Generally, this file is kept in the System folder in the Preferences folder, though it may also be in the Claris or Extensions folders, or in the System Folder itself. This file is used by the Claris XTND system as an index to where all the file translators are located, and it might be corrupted. Deleting forces a fresh, clean XTND Translator List to be built.

If deleting the XTND Translator List does not solve the problem, reinstall the Claris XTND system and the Claris Translators. Both of these files should be installed in the Claris folder in the System Folder.

What to Do When your Screen and the Printout DonÕt Match

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
Sometimes you print your worksheet and cells that show properly on the screen are filled with asterisks on the printout. Or, the legend disappears from a chart you've constructed.

The problem is that measurements for fonts and graphic items can differ slightly between screen resolution (72 dpi) and printer resolution (300 dpi or more).

- If cells are filled with asterisks ("******"), zoom into 400%. The asterisks should appear here, and you can make minor adjustments to the column width so the value will fit. Viewing at 400% gives you a more accurate picture of what Resolve is sending to the printer.
- If charts change their appearance, ungroup them before printing. Normally, Claris Resolve automatically designs charts for the best appearance. Changes in object measurements at the higher, printed resolution can cause Resolve to change its mind about what will look attractive. Ungrouping a chart turns off this auto-design feature.

- Check page setup. If font substitution is active, the printer will be using different fonts than you specified on-screen.

Select the right range for regression analysis

The Regression Range (or Matrix Range) defined when using the Regression option in the Matrix dialog box must include at least one row more that the number of columns specified.

For example: If your Regression Range includes one Dependent variable and two Independent variables (three columns) then at least four rows (observations) must be defined (five if column titles are included).

If fewer rows than columns are defined, Claris Resolve will report, "Insufficient number of observations." If the same number of rows and columns are specified, you'll be told, "No observations." Valid results are obtained only when there are more rows (observations) than columns (variables).

"Not Enough Memory to Run Application" Error Message

Modifying the Autoexec.bat file allows ClarisWorks to run correctly

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.

If memory on a DOS/ Windows machine is configured improperly, or there is a driver conflict, the error message "Not enough memory to run application, please close some applications and try again" will appear. One particular instance is this:

Config.sys Autoexec.bat
C:\\dos\\setver.exe Pcache
C:\\windows\\himem.sys C:\\windows\\smartdrv.exe
dos=high Prompt pg
files=10 Set Mouse=C:\\mouse
stacks=9,256 c:\\mouse\\mouse.com
Path ....
Set temp=c:\\dos

Removing the Pcache line in the Autoexec.bat, increasing files to 40, and adding a Buffers=20 line allowed ClarisWorks to run.

Capturing and Printing a Screen Shot in Windows

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
Sometimes it is necessary to obtain a hardcopy of your screen. In order to get a copy, or screen shot, of your screen you need only press the Print Screen key. This copies the current screen to the Windows clipboard. Here are the complete steps:

1. Press the Print Screen key.
2. Open Paintbrush, usually in the Accessories group.
3. On the options menu, select Image Attributes. Click on the Pels radio button.
4. Set the Width to 640 and the Height to 480. If you are using higher resolutions, use the appropriate settings - 800 x 600 or 1024 x 768.
5. From the View menu, select Zoom Out.
6. From the Edit menu, select paste.
7. Click in the gray area to the left of the crosshatched rectangle.
8. From the View menu, select Zoom In.

You will now see a copy of your screen you were looking at when you pressed the Print Screen key. Under the File menu, you can now select Save and save the screen shot as a .BMP file. Otherwise, you can immediately print out the screen shot by selecting Print from the File menu in Paintbrush.

Character Clipped When Printing to Laserjet

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
When printing out of the database module of ClarisWorks 1.0v1 for Windows, number fields formatted as currency and aligned right may clip the last character when printing to HP Laserjet printers in native PCL mode. Clipping also depends on how many digits are in the field, with numbers longer than 5 significant figures (such as 100.23) exhibiting the symptom more often. The solution is to set the option to print TrueType as graphics.

For HP Laserjet II and III series printers:
1. Select Print Setup from the File menu.
2. Click the Options button on the right side of the Print Setup dialog box.
3. Check the "Print Truetype as Graphics" checkbox

The HP IV driver must change graphics mode from HP-GL/2 to Raster, and then the Print TrueType as Graphics option can be selected.
Published Date: Feb 18, 2012

How to Get a Page Break when Importing Text

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.

Q. I want to import a text file into ClarisWorks that includes page breaks. I tried pressing the Enter key to get them, but it's converted to a simple return. What do you suggest?

A. If you have a text editor that can handle special text characters, insert ASCII 12 (hex $0C) wherever you want a new page. That should give you the breaks you need.

Display Card 8■24 GC: Questions and Answers (11/94)

Here are some questions and answers about the Macintosh Display Card 8*24 GC.

This article has been archived and is no longer updated by Apple.

Q) The card supports NuBus master and slave block transfer modes. I was under the impression that not all Macintosh models support block transfer mode.

a) Does this imply that there are third-party video cards that DO support block transfer? If yes, do you know the manufacturers' names?

b) Will the Display Card 8*24 GC run even faster when talking to one of these video cards (faster than without block transfer, but still not as fast as the on-board video)?

A) The Macintosh IIfx does support slave block transfer mode; the other Macintosh models do not have this support. The Display Card 8*24 GC block transfer function is primarily for use between NuBus cards with block transfer abilities.

a) We currently do not know of any third-party cards that support block transfer. Beside the Display Card 8*24 GC, the only video card we know of that supports block transfer is the Display Card 8*24 in its 8-bit mode.

b) The Display Card 8*24 GC would accelerate a second card that has block transfer to a greater degree than it would accelerate a second card that does not have block transfer. The second card (with block transfer) would not run as fast as the Display Card 8*24 GC performing all operations itself. (We assume that "on-board video" means the video on the Display Card 8*24 GC as opposed to logic board video, like on the Macintosh IIci.)

Q) It seems that the use of off-screen bitmap algorithms actually slow down the Display Card 8*24 GC.

a) Is this true?

b) How does adding DRAM to the card boost off-screen performance?

c) Do I need to rework my graphics code to use it?

A)

a) We are unsure what you are asking -- slow down the Display Card 8*24 GC compared to what? If this is in reference to moving off-screen bitmaps across NuBus compared to using the local DRAM for off-screen bitmaps, the answer is yes, moving bitmaps across NuBus is slower than using the local DRAM.

b) When DRAM is installed on the card, it is automatically used for off-screen bitmaps.

c) Since the off-screen bitmaps automatically and transparently use the DRAM, there is no need to change an application's code to take advantage of this function.

Q) More generally, do you have any information that outlines all the factors that determine the ultimate speed of any graphic operation? For example:

a) Speed of the CPU running QuickDraw routines relative to AM29000 speed. (How much faster is the AM29000 QuickDraw than the regular Macintosh version?)

b) On-screen versus off-screen algorithms.

c) On-board video versus third-party video cards.

d) Effect of various NuBus byte lane width specifications when transferring data from one board to another.

e) 1-bit versus 8-bit or more graphics.

A)

a) This depends on the action being taken; a straight line from point A to point B will not benefit to the degree that a complex polygon would. The AM29000 performance is from 5 times to 30 times faster than unaccelerated performance.

b) The creation of the on-screen image and off-screen image will be equal. Since only QuickDraw variables and small data structures are moved across NuBus, there is an improvement in this image creation compared to standard video cards. However, the biggest benefit is when the previously created off-screen image is moved onscreen.

c) We are not sure what is being asked. We do not have specifications for third party-cards. (We hope this is the information being requested.) Typical reads and writes from the Macintosh to display cards are performed in 1000 and 500 nanoseconds, respectively. (This is what we believe you are requesting for the standard video cards.) The Display Card 8*24 GC and writes to its frame buffer (off-screen bitmaps in DRAM) at a rate of 66 reads 60 132 nanoseconds. (This is what we believe you are requesting for the on-board video specifications.)

d) We have not been able to locate an answer for the byte lanes issue. We will do our best to provide details on this in a later response.

e) The following applies during image movement from Macintosh memory across NuBus to standard video cards or during image movement from Display Card 8*24 GC frame buffer to Display Card 8*24 GC display:

When moving 24-bit images, you are moving 4 times as much data than moving 8-bit images and 24 times as much data than moving 1-bit images. When moving 8-bit images, you are moving 8 times as much data than moving 1-bit images.

The movement of image data from Macintosh memory to the Display Card 8*24 GC is different because only variables and small portions of data structures are being moved across NuBus--not large, deep bitmap images. There is a small increase in the amount of data sent as you move from 1-bit to 8-bit to 24-bit; however, 8-bit and 24-bit are very close. The bitmaps grow dramatically; the variables and data structures remain relatively flat.

Q) When does the Display Card 8*24 GC accelerate third-party cards?

A) The Display Card 8*24 GC accelerates other video cards via its pseudo-block transfer. This is similar to block transfer in that it claims the bus for a 16 NuBus data word transaction, but different in that it must send an address word for each data word that it sends. The extra transfer activity makes pseudo-block transfer slower than block transfer, but it is still an improvement over normal NuBus access times.

Article Change History:
07 Nov 1994 - Changed 8/24 to 8*24 for consistency with other articles.

Use Macros to Add a "Replace All" Command

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
Sometimes you want to fill all the fields in the selected set of records with the same value. For example: you just sent bill reminders to several hundred customers. You want to put today's date into the "reminder sent" field for all those records.

Here's how to build a ClarisWorks macro to handle the chore:

1. Create a new ClarisWorks database file with any two fields. Add three empty records. This file lets you use the commands necessary for the macro, without affecting any actual data.

2. Click into any field.

3. Choose Record MacroÉfrom the Macro item of the File menu.

4. Call the new macro "Repeat Loop" and specify the keyboard equivalent Command-Option-r. Click "Record."

5. Type the following key combinations in sequence:
Command-A
Command-V
Command-Return
Command-Option-r
Command-Shift-J

Once you press Command-Shift-J, the macro is finished recording.

6. Again choose Record Macro from the Macro item of the File menu.

4. Call the new macro "Replace All" and specify the keyboard equivalent Command-Option-=.

7. Type the following key combinations in sequence:
Command-A
Command-C
Command-G

At this point, the "Go to Record" dialog box appears. Type the number 1 then press Return.

Continue with the following key combinations:
Command-Option-r
Shift-Command-J

8. Choose Save Macros... from the Macro item of the File menu to store your work on disk.
Whenever you want to use your new "Replace All" command, just click into a field and press Command-Option-=. The contents of that field in every record will be changed to match the value in the current record. When the macro reaches the end of the database, you stop it by pressing Command-Period.

How it works
If you were to manually update the file, you would probably copy the field value you wanted to the clipboard. Then, starting from the first record, you would paste it into the appropriate field in each record. Suppose the cursor was in the field holding the value you wanted replaced throughout the database. Here's the steps you would take by hand:

A. Copy the entire contents of the current field.

B. Go to the same field in the first record.

C. Replace whatever is in the field with what's on the clipboard.

D. Go to the next record.

E. Go to step C.

The first macro sequence you created, in step 5, performs steps C through E. It selects everything in the current field, pastes whatever is in the clipboard, moves to the next record (Command-Return), then calls itself (Command-Option-r). In other words, the last step in the macro is to "type" the keyboard equivalent for itself. This way the macro repeats itself forever or until you press Command-Period to stop it.

The next macro, the one you set up in step 7, sets things up. It's analogous to steps A and B. The macro copies the current field value to the clipboard, then moves to the first record in the found set. (Fortunately, when you use the Go To Record command ClarisWorks doesn't move the insertion point to a different field.) The last step in the macro, Command-Option-r, sets loose the recursive "Repeat Loop" macro through all your records, replacing the data.

White-colored Text can be Hard to Read (WP)

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.

Q. I imported a 10-page AppleWorks term paper to ClarisWorks, but the window seems blank. What's happening?

A. Sometimes extraneous data in the AppleWorks file misleads the translator into using a white text color. Your work is there, but you can't see it. Just use choose Select All from the Edit menu, then choose Text Color from the Style menu to set the color to black.

Published Date: Feb 18, 2012

About Version 1.0v4 Macintosh Updater, Read Me

This is the Read Me file included with the ClarisWorks 1.0v4 Updater. It explains how to use the updater and also covers the mechanics of exchanging files between the Macintosh and Windows version of ClarisWorks 1.0.

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.

What's New with ClarisWorks 1.0v4?

This revision of ClarisWorks is for users who need to exchange files between the Mac and Windows versions of ClarisWorks 1.0. ClarisWorks 1.0v4 will automatically recognize ClarisWorks Windows files that have the .CWK and .CWS file extension1. This eliminates the need for any external file utilities to convert your files. This new version also substitutes the correct fonts (if possible) when opening a ClarisWorks Windows file. No other enhancements or fixes have been added.

ClarisWorks 1.0v4 uses the same file format as the previous versions, so you will be able to open and work with your previous documents without any conversion or modification.

How the Updater Works

This updater will create a new version of ClarisWorks in the same place that you store your current copy of ClarisWorks. This update will only modify ClarisWorks 1.0v1, v2 and v3. The update is a two step process. In Part I, you will update the application. In Part II, you will update the file translators.

Virus Detection Software

The Updater makes several changes to the resources in ClarisWorks. Many virus utilities consider this activity improper and may try to prevent it. To avoid this inconvenience, disable all virus detection software and restart your Macintosh before applying the update.

Hard Disk Space

For this installation to be successful, be sure that you have at least 1MB of free disk space.

Part I: Updating the Application

1. Double click on the ClarisWorks 1.0v4 Updater icon.
2. Click OK.
3. The Updater will attempt to find your copy of ClarisWorks. If the Updater fails to find it, you will need to locate and select your current version of ClarisWorks.
4. Click Update.
5. You will then get a status bar showing ClarisWorks is being updated. When it has finished, you will get a dialog that indicates a successful update. Click OK to continue.
6. From the desktop, go to the folder that contains ClarisWorks.You will find your original program and the new version which will be labeled ClarisWorks 1.0v4.

7. To ensure the updater worked correctly, double click on the new ClarisWorks application. If successful, quit ClarisWorks and return to the Finder.
8. Place your original version of ClarisWorks in the Trash and choose Empty Trash from the Special menu in the Finder.

Part II: Updating the Translators

ClarisWorks uses a special file, ClarisWorks Translators. Because this file changes with each version, you will need to update your existing ClarisWorks Translators file. To replace this file follow these steps:

1. Open the System Folder on your hard disk.
2. Locate and Open the Claris folder.
3. Copy the new ClarisWorks Translators file from the updater diskette into the Claris folder; respond OK when asked whether to Replace the existing file. Note: be sure not to copy this file into the Claris Translators folder. If you do, the import/export capability will not work.
4. The standard installation of ClarisWorks places the ClarisWorks Translators file in the Claris folder. If you have done a custom installation, this file will either be in the System Folder or in the same folder as ClarisWorks. If this is the case, locate the file and replace as directed.

5. Close all of your folders.

Congratulations, you've successfully updated to 1.0v4!

Exchanging files between ClarisWorks Macintosh and Windows

Using Diskettes-

To successfully exchange files between Macintosh and Windows you need to be aware of a few issues. If you plan to exchange files via diskette, your Macintosh must be equipped with a Superdrive (FDHD). You must also have one of the following software programs: Apple File Exchange,

Access PC, DOS Mounter or PC Exchange (Apple File Exchange is included with every Macintosh whereas the other software packages mentioned must be purchased separately). Refer to the manual included with these programs for questions regarding their operation.

Naming Files-
When moving from Windows to Mac or Mac to Windows your file name must have a .CWK or .CWS extension. In addition, when moving from Mac to Windows you must follow DOS naming conventions and use only eight characters in your file name or it will be truncated to eight characters.

Opening Files-
Once your file has been transferred onto your hard drive, you will be able to open the file by using one of two methods. The first method is to open the file from within ClarisWorks by using the Open command from the File menu. The second method is to Drop Launch the file (System 7 required) from the Finder. To Drop Launch, select the file you want to open and drag it on top of the ClarisWorks application icon. When you release the mouse button, ClarisWorks will automatically open the file. This method will also opens multiple files simultaneously.

Because of the operating system differences between the Mac and Windows platforms, you will not be able to open ClarisWorks Windows files on your Mac by double clicking on them. Instead, use one of the methods listed above. Once you have opened the file and saved it on your Mac hard drive, as a ClarisWorks Mac file, you will be able to double click the file to open it.

ClarisWorks License Agreement

The enclosed UpdateMaker updater program is ©1992 by AD Instruments, Inc. Suite H, 2251 Grant Rd., Los Altos, CA 92024.

The software code changes contained within the Updater, the original software, and the software created by the updater program are © 1991-1993 Claris Corporation. All Rights Reserved. Claris and ClarisWorks are registered trademarks of Claris Corporation. All other trademarks are property of their respective owners.

The following license agreement applies:

PLEASE READ THIS DOCUMENT CAREFULLY PRIOR TO USING THIS SOFTWARE.

The enclosed computer program is an update (the "Update") to ClarisWorks 1.0 (the "Software"). In order to use and/or copy the Update as authorized by this License, you must have validly licensed at least one copy of the Software. You are required to have a validly licensed copy of the Software for each copy of the Update made hereunder. The Update and the copies authorized herein replace your validly licensed copies of the Software and are not additional copies (i.e., you may not use the Update in addition to the Software the Update is replacing).

The Update is licensed, not sold, to you by Claris Corporation ("Claris") for use only under the terms of this License, and Claris reserves any rights not expressly granted to you. You own the disk(s) on which the Update is recorded or fixed, but Claris and its licensers retain ownership of the Update itself.

1. License. This License allows you to (i) make copies of the Update, only up to the number of validly licensed copies of the Software in your possession and (ii) use each such authorized copy on a single computer at a time. You are required to have a validly licensed copy of the Software for each copy of the Update made hereunder. The Update and the copies authorized herein replace your validly licensed copies of the Software and are not additional copies. To "use" the Update means that the Update is either loaded in the temporary memory (i.e., RAM) of a computer or installed on the permanent memory of a computer (i.e., hard disk, CD ROM, etc.). You may use at one time as many copies of the Update as you have licenses for. You may install the Update on a common storage device shared by multiple computers, provided that if you have more computers having access to the common storage device than the number of licensed copies of the Update, you must have some software mechanism which locks-out any concurrent users in excess of the number of licensed copies of the Update (an additional License is not needed for

the one copy of the Update stored on the common storage device accessed by multiple computers). If the Update is installed on the permanent memory of a single desktop computer (i.e., not a storage device shared by multiple computers) and that desktop computer is used by one individual for at least 80% of the time the computer is in use, that same individual may also use a copy of the Update on a portable or home computer.

The Update is protected by copyright law. As an express condition of this License, you must reproduce on each copy the Claris copyright notice and any other proprietary legends that were on the original copy supplied by Claris.

You may permanently transfer all your rights under this License to another party by providing to such party all copies of the Update licensed under this License, and the Software the Update replaces, together with a copy of this License and all written materials accompanying the Update, provided that the other party reads and agrees to accept the terms and conditions of this License.

2. Restrictions. The Update contains trade secrets in its human perceivable form and, to protect them, you may not REVERSE ENGINEER, DECOMPILE, DISASSEMBLE, OR OTHERWISE REDUCE THE UPDATE TO ANY HUMAN PERCEIVABLE FORM. YOU MAY NOT MODIFY, ADAPT, TRANSLATE, RENT, LEASE, LOAN, RESELL FOR PROFIT, OR CREATE DERIVATIVE WORKS BASED UPON THE UPDATE OR ANY PART THEREOF.

3. Termination. This License is effective until terminated. This License will terminate immediately without notice from Claris or judicial resolution if you fail to comply with any provision of this License. Upon such termination you must destroy the Update, all accompanying written materials, and all copies thereof. You may also terminate this License at any time by destroying the Update, all accompanying written materials and all copies thereof.

4. Export Law Assurances. You agree that neither the Update nor any direct product thereof is being or will be shipped, transferred or reexported, directly or indirectly, into any country prohibited by the United States Export Administration Act and the regulations thereunder or will be used for any purpose prohibited by the Act.

5. Limited Warranty and Disclaimer, Limitation of Remedies and Damages. YOU ACKNOWLEDGE THAT THE UPDATE MAY NOT SATISFY ALL YOUR REQUIREMENTS OR BE FREE FROM DEFECTS. CLARIS WARRANTS THE DISKETTES ON WHICH THE UPDATE IS RECORDED TO BE FREE FROM DEFECTS IN MATERIALS AND WORKMANSHIP UNDER NORMAL USE FOR 90 DAYS FROM PURCHASE, BUT THE UPDATE AND ACCOMPANYING WRITTEN MATERIALS ARE LICENSED "AS IS." ALL IMPLIED WARRANTIES AND CONDITIONS (INCLUDING ANY IMPLIED WARRANTY OF MERCHANTABILITY OR FITNESS FOR A PARTICULAR PURPOSE) ARE DISCLAIMED AS TO THE UPDATE AND ACCOMPANYING WRITTEN MATERIALS AND LIMITED TO 90 DAYS AS TO THE DISKETTES. YOUR EXCLUSIVE REMEDY FOR BREACH OF WARRANTY WILL BE THE REPLACEMENT OF THE DISKETTES OR REFUND OF THE PURCHASE PRICE. IN NO EVENT WILL CLARIS OR ITS DEVELOPERS, DIRECTORS, OFFICERS, EMPLOYEES OR AFFILIATES BE LIABLE TO YOU FOR ANY CONSEQUENTIAL, INCIDENTAL OR INDIRECT DAMAGES (INCLUDING DAMAGES FOR LOSS OF BUSINESS PROFITS, BUSINESS INTERRUPTION, LOSS OF BUSINESS INFORMATION, AND THE LIKE), WHETHER FORESEEABLE OR UNFORESEEABLE, ARISING OUT OF THE USE OF OR INABILITY TO USE THE UPDATE OR ACCOMPANYING WRITTEN MATERIALS, REGARDLESS OF THE BASIS OF THE CLAIM AND EVEN IF CLARIS OR AN AUTHORIZED CLARIS REPRESENTATIVE HAS BEEN ADVISED OF THE POSSIBILITY OF SUCH DAMAGES.

Claris' liability to you for actual damages for any cause whatsoever, and regardless of the form of the action, will be limited to the greater of $500 or the money paid for the Update that caused the damages.

THE ABOVE LIMITATIONS WILL NOT APPLY IN CASE OF PERSONAL INJURY ONLY WHERE AND TO THE EXTENT THAT APPLICABLE LAW REQUIRES SUCH LIABILITY. BECAUSE SOME JURISDICTIONS DO NOT ALLOW THE EXCLUSION OR LIMITATION OF IMPLIED WARRANTIES OR LIABILITY FOR CONSEQUENTIAL OR INCIDENTAL DAMAGES, THE ABOVE LIMITATIONS MAY NOT APPLY TO YOU.

6. General. This License will be construed under the laws of the State of California, except for that body of law dealing with conflicts of law. If any provision of this License shall be held by a court of competent jurisdiction to be contrary to law, that provision will be enforced to the maximum extent permissible, and the remaining provisions of this License will remain in full force and effect. If you are a U.S. Government end-user, this License of the Update conveys only "RESTRICTED RIGHTS," and its use, disclosure and duplication are subject to Federal Acquisition Regulations, 52.227-7013 (c) (1) (ii). (See the U.S. Government Restricted provision in the user manual.)

Exchanging Files between the Macintosh and Windows Versions

This is an expanded excerpt from the ClarisWorks 1.0v4 Macintosh Updater Read Me document.

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.

Using Diskettes

If you plan to exchange files via diskette, your Macintosh and Windows machines must be equipped with a Superdrive (FDHD). You must also have one of the following software Macintosh programs to save a file to a DOS formatted floppy: Apple File Exchange, Access PC, DOS Mounter or PC Exchange (Apple File Exchange is included with every Macintosh whereas the other software packages mentioned must be purchased separately). Refer to the manual included with these programs for questions regarding their operation.

Using Network Servers

If you have a network server which lets Macintosh and Windows computers share files, you will be able to share ClarisWorks files seamlessly as long as you use naming conventions.

Naming Files

When moving from Windows to Mac or Mac to Windows your file name must end with the .CWK or .CWS extension. The .CWS extension is used for stationery files. In addition, when moving from Mac to Windows you must follow DOS naming conventions and use only eight characters in your file name or it will be truncated to eight characters.

Opening Windows files on the Macintosh

You will need ClarisWorks 1.0v4 for Macintosh to be able to open ClarisWorks Windows files. An Updater is available on America Online, Compuserv e, AppleLink and the Claris BBS (408-987-7421; settings 8/N/1) as well as via Claris Customer Assistance at 408-727-8227.

Once your file has been transferred onto your hard drive, you will be able to open the file by using one of two methods. The first method is to open the file from within ClarisWorks by using the Open command from the File menu. The second method is to Drop Launch the file (System 7 required) from the Finder. To Drop Launch, select the file you want to open and drag it on top of the ClarisWorks application icon. When you release the mouse button, ClarisWorks will automatically open the file. This method will also opens multiple files simultaneously.

Because of the operating system differences between the Mac and Windows platforms, you will not be able to open ClarisWorks Windows files on your Mac by double clicking on them. Instead, use one of the methods listed above. Once you have opened the file and saved it on your Mac hard drive, as a ClarisWorks Mac file, you will be able to double click the file to open it.

Opening Macintosh files in Windows

After saving a Macintosh file to a DOS formatted floppy or a network server, as long as it follows the naming conventions outlined above, you will be able to open it via the open menu in ClarisWorks for Windows or by double clicking the file in File Manager.

Paint Lines or Edges of Objects Printing Jagged (Not Smoothly) (PT)

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.

If lines or the edges of objects in the ClarisWorks Paint environment/frame print jagged or not as smoothly as you'd like, check to see if the Color/Grayscale option from the Print Dialog Box is chosen.

If so, choose the Black and White option (also in the Print Dialog Box) and print again.

Printing To A Com or Serial Port

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
If you want to print to a Com, or serial communications, port you must have the following commands in your Autoexec.bat file:

MODE LPT1=Com1

No baud rate statement is needed, the default settings used should work fine.
If all your other Windows applications can print to the printer connected to a COM port but FileMaker Pro reports that it is unable to print to LPT1 then you must edit the Claris.ini file to read:

Printer=

Deleting the data after the equals sign will cause FileMaker Pro to use the Windows default.

Dr. Watson Utility

Dr. Watson logs may help Technical Support troubleshoot a crash when using a Claris application.

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.
Dr. Watson is a Microsoft utility that ships with Windows 3.1 to record system information during a crash. You can easily set up Dr. Watson to run in the background whenever you run Windows. If your computer crashes, Dr. Watson will record what the error was, in what memory location it occurred, and what applications were running at the time of the error.

To install Dr. Watson:

* Open the Startup group from the Program Manager in Windows.
* Choose New from the File menu and select Program Item. Click OK.
* Type the following in the Program Item Properties dialog box:

Description: Dr. Watson
Command Line: drwatson.exe
Working Directory: [leave blank]
Shortcut Key: None

Dr. Watson creates a text file in your Windows directory called drwatson.log that you can read with a word processor. If the file already exists, Dr. Watson appends new information to the file. If your log becomes too large, you can rename or delete the file. The next time Dr. Watson runs, it will create a new drwatson.log file.

If you get a GPF or crash in a Claris application, you can have a Technical Support specialist review the Dr. Watson log. You can either upload the text file to our BBS at (408) 987-7421 or print the file and fax it to Technical Support at (408) 987-7447.

Margins Always Default to One Inch for Paint Document, But Vary on Other Documents (PT)

Here's a way to have your ClarisWorks Paint documents default to margins smaller (or larger) than one inch.

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.

When you create a new Paint document in ClarisWorks 2.0 or higher the margins are always preset to one inch. All other documents vary depending on the type of printer that is chosen when creating a new document. If you like smaller margins make a Stationery document to save your preferred margins. To set the new margins as the default, name the Stationery document "ClarisWorks PT Options" and save it into the Claris folder located in the System Folder.

Published Date: Feb 18, 2012

Margins Appear Different Between Text Ruler and Graphics Ruler (All)

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
The graphics ruler starts measuring from the beginning of the left margin (printable area) whereas the text ruler starts measuring from the edge of the page (including non-printable area). Therefore it may appear you have less printable area in a Paint or Draw document vs. a Word Processing document even though the margins are the same.

Unused Space in Calculation Field Not Removed By Sliding Objects (DB)

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
Sliding objects up and left to remove unused space is set by default when creating a label layout. However, if the field on the left is a calculated field and the fields to the right are regular text fields, sliding will not occur.

For example, if you are making address labels and want the comma to be right after the name of the City, using a calculation and concatenating would do it. But the State and Zip Code fields will no longer slide left, eliminating the blank space.

The only workaround is to combine the whole row of fields in the calculation.

For example, a single calculation to concatenate these fields including a comma might be:

CityStateZip (calculation, text result)= 'City'&" , "&'State'&" "&'Zip'

Or the CONCAT function could be used:
CityStateZip (calculation, text result)= CONCAT('City',", ",'State'," ",'Zip')

Macintosh SE: Color QuickDraw Print Restrictions

I created a PowerPoint document with a number of colors defined. The document printed without problems to a 35mm slidemaker from their Macintosh II, but when I printed the document from a Macintosh SE, I could print only eight colors.

1) Can you receive the same color printout results from a Macintosh SE or any Macintosh?

2) Are there restrictions when printing color from a Macintosh SE?

This article has been archived and is no longer updated by Apple.
1) Macintosh Plus, Macintosh SE, and prior models support only the eight colors that are available in the original QuickDraw. All Macintosh II computers and the Macintosh SE/30 support Color QuickDraw, which provides 256 colors. Therefore, using original QuickDraw (Macintosh Plus, Macintosh SE, and earlier) provides eight colors; while using Color QuickDraw (Macintosh II family and Macintosh SE/30) provides 256 colors. However, please note the third-party issues below.

2) There is a limit of eight colors as supported by the ROMs in the Macintosh SE. However, please note the third-party issues below.

Some third parties have devised methods to work around the limits imposed by the Macintosh ROMs. Some third-party film recorders (slidemakers) do not work with the Macintosh SE/30 under Color QuickDraw, but work on the Macintosh SE/30 by assigning colors to be equal to certain black and white patterns. (This also may be supported on the Macintosh SE and Macintosh Plus.)

Other third-party products can print Macintosh II 8-bit color images from a Macintosh SE/30 without any changes. Without knowing which 35mm film recorder is in use, we cannot tell you the limits the product imposes on the Macintosh. To understand these limits, check the film recorder documentation.

ClarisWorks Splash screen Slow On Launching (International Serialized Versions Only)

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.

The more recent serialized versions (International only) of ClarisWorks splashscreen are slow loading due to looking over the network as part of the serialization (copy protection scheme) to see if there are any other copies of ClarisWorks with the same serial number. After serializing a copy of ClarisWorks, it takes 20 seconds to launch with AppleTalk turned ON and only 5 seconds to launch with AppleTalk turned OFF. It always took longer to launch serialized copies but it now takes even longer because it is looking across zones. Before it only searched within the current zone.

Fonts from Adobe Type On Call may be Corrupted

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
It's not unusual for corrupt or incomplete fonts to spell trouble for your applications. Claris programs might crash at the startup screen, or you might notice fonts changing unexpectedly as you scroll through your document, zoom in and out or change views. Some problems are more obvious than others, and some programs may show trouble, while others seem to work fine.

What is unusual is that some efforts to solve the problem can make it worse. For example, one way to avoid font troubles is to stick with a single font vendor and use the the latest versions of their font suitcases. If you select Adobe as your font vendor, you could turn to the most recent Type On Call CD-ROM as your source of the latest font files.

Adobe Type On Call, available with Adobe SuperATM or separately, offers the complete collection of Adobe typefaces on a CD-ROM. As you need typefaces, you can call Adobe, give them a credit card number, and they will supply you with a code to unlock fonts as you need them.

The problem is that the unlocking scheme does not work well with some CD-ROM software drivers. For example, if you use an Apple CD-ROM drive, you must use version 4.0.2 or later of the Apple CD-ROM extension. Otherwise, fonts you copy from the unlocked volume of the Type On Call disk will usually be corrupt. The font suitcases will look identical to non-corrupt ones -the same number of bytes, etc.- but will not function correctly.

The best solution is to obtain the Apple CD-ROM extension 4.0.2 or later. This is currently unavailable from most online services. You must contact your dealer.

Another solution that seems to work well is to copy the bitmap suitcases from the unlocked volume of the Type On Call CD. When Adobe's locking technology is not in use, the files seem to transfer correctly.

Many other companies use similar locking techniques for distribution of fonts, software, and technical information. If you are experiencing trouble using software from one of these types of products, contact the vendor to make sure your driver software is compatible with the locking technology.

Line Spacing Double After Saving as Microsoft Word 4.0 (WP)

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
Paragraphs which are set for line spacing in points rather than the default measurement will have line spacing of twice that size when saved as Word 4.0 and opened in Microsoft Word.

Steps to recreate:
1. Create a new ClarisWorks WP document.
2. Enter a paragraph of text, enough to create multiple lines.
3. Choose Paragraph from the Format menu and select pt (points) from the Line Spacing popup menu. Press OK.
4. Save As MS Word 4.0.
5. Open the document in Word and notice that the line spacing is double what you specified in ClarisWorks. For example, a line spacing of 16 pt in ClarisWorks is saved as 32 pt in MS Word format.

The same test was done with ClarisImpact and ClarisWorks using the Word 4.0 translator but opening the file in Word 5.1. The translation produced an extra carriage return at the end of the document whereas MacWrite II files converted to Word 5.1 did not produce the extra carriage return.

Master Page Not Saved as PICT (DR)

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
In a ClarisWorks 2.0 Drawing document, you can select "Edit Master Page" from the Options menu to create objects that will show on every slide in a Slide Show.

Objects created while editing the Master Page of a drawing document are not saved when the document is saved as a PICT file.

A workaround is to choose "Edit Master Page" (Options menu), then "Select All" and "Copy" (Edit menu). Then deselect "Edit Master Page" and use the "Paste" and "Move To Back" commands on each page of the document before using the "Save As..." command.

ClarisWorks: Transparent Paint Frame Prints Opaque to PostScript Printer

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.

Adding a Paint frame reserves an area in the current document. If the Paint frame is filled with the transparent pattern, the objects on the document that were placed first will appear through the portions of the Paint frame that don't display the image. The result on screen is seamlessly integrated Paint, Text and Draw elements, with a layered or superimposed visual effect.

However, when printing to a PostScript LaserWriter with the Color/Grayscale option selected in the Print dialog box, the Paint frame will print white or opaque, unlike what you may see on the screen. In order to get the Paint frame to print without a white box around it, choose Black and White rather than Color/Grayscale in the Print dialog box.

NOTE: This is a known limitation of PostScript. Thus, another workaround would be to print to any QuickDraw printer.

Published Date: Feb 18, 2012

"Sorry, that area is too complicated" Error Message (PT)

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
When trying to select an area with the magic wand, lasso tool, or the selection rectangle with the Command key held down, the error message stating, "Sorry, that area is too complicated" may occur.

Explanation:
ClarisWorks and ClarisDraw use Quickdraw routines that are available through the Mac's operating system. The Macintosh operating system defines an element called a region. A region can be any arbitrary shape which can be described by combinations of pixels, lines, ovals, etc. The operating system stores the shape as a compressed collection of the individual scan lines (horizontal lines). One wide rectangle that is somewhat flat would be a small region. One tall rectangle, narrow or not, would be a larger region in the Macintosh scheme because it passes through several scan lines. Anyway, the Macintosh is limited to regions of no more than 32k of data. If you have created a picture and selected a large region with the magic wand or lasso (like trying to lasso a lot of light spray painting), you get the error described above. Applications like Photoshop work around this problem by not using Apple's provided QuickDraw utilities.

Workaround:
Reduce the total area that you're attempting to select at one time.

If Statements Returns Both Results Separated By Comma

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
If you are using an international version of Windows or have otherwise changed settings in the International Control Panel so that a comma is the decimal separator, as opposed to a decimal point, you may get extra commas from an If statement in the ClarisWorks spreadsheet.

Example:
Cell A1 has the number 12 in it
Cell A2 has a calculation: =IF (A1 , 5,1)

Cell A2 will result in 5,1 if the International Control Panels have a comma for a decimal separator as opposed to a decimal point. Changing the Control Panel settings back to a decimal point fixes the problem.

Fixing Problems with Sliding Objects - Calculation Field Workaround (DB)

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
ClarisWorks and FileMaker Pro include a feature called Slide Objects which will allow you to remove extra space within fields when printing. Slide Objects can slide left, removing unused space between two adjacent fields (say, FirstName and LastName). Slide Objects can also slide up, removing blank lines when a field is blank.

In ClarisWorks versions 1, 2 and 3, to get sliding objects to work, you will need to place the fields very precisely. Please read Part II below for instructions. Note: if you're using ClarisWorks version 1.0v2 or 1.0v3 and importing data, you will need to update to version 1.0v3 or later.

Note: ClarisWorks 4.0/5.0 label layouts:
ClarisWorks 4.0/5.0 includes a Label Assistant. Use the label assistant to create your label layouts, instead of following the instructions below. It's easier to create a new layout with the Label Assistant than to fix an existing layout. To use the Label Assistant, open your database, then go to Browse, then select ClarisWorks Assistants from the Help (?) Menu.

Note: FileMaker Pro 3.0 label layouts:
FileMaker Pro 3.0 label layouts contain Merge Fields instead of field boxes. These merge fields automatically slide the data together, without using the Sliding Objects feature. So, you donÕt need to follow the instructions below. You can use Merge Fields on any layout where you want the data to slide together

The following two parts explain how to make Slide Objects work:

Part 1 - Using a Calculation Field Instead
This method uses calculation fields to concatenate (combine) the data into a single field. When you use this field on your layout, Sliding Objects is not needed, because the data in the calculation field is already combined. This can be much easier than using the original fields with Sliding Objects.
Disadvantages:
The data will be duplicated in your file, making the file larger. Also, in ClarisWorks, since text in calculation fields won't wrap, you should only use this for text that will fit on a single line.

Part 2 - Getting Sliding Objects to Work in ClarisWorks

This method explains how to place the fields on a layout and get Sliding Objects to work properly.

Part 1 - Fixing Problems with Sliding Objects - Using a Calculation Instead

Fixing sliding left:
You can replace the fields on your layout with fields with the data concatenated (combined). These fields already have the data combined, so the Sliding Objects feature is not needed. You should define one calculation field for each row where your layout has multiple fields.

Consider this field layout:
«First Name» «Last Name»
«Address 1»
«Address 2»
«City», «State» «ZIP»

In this example, you would define one calculation field to replace First Name and Last Name on the layout. You would define a second calculation field to replace «City», «State» «ZIP».

A. Defining the Calculation Field.
This is how to define a new field called CityStateZip Combined, which will replace the City, State and ZIP fields on your layout. (For this example, when you see the underscore character (_), that means to type a space.)

1) Go to Define Fields. Type in the name of the new field, 'CityStateZIP Combined.' Click the Calculation button. Click Create.

2) Click on the popup menu to change the calculation result to Text.

3) Enter the calculation formula. It will look like this -
FileMaker: City & ",_" & State & "_" & Zip
ClarisWorks: 'City' & ",_" & 'State' & "_" & 'Zip'
ClarisWorks (alternate formula): CONCAT('City',",_" , 'State' , "_" , 'Zip')

4) Define similar calculation fields as needed. For example, you could define a calculation field called Full Name, to replace the First Name and Last Name fields on your layout. Sample forumulas for ClarisWorks:
'First Name' & "_" & 'Last Name'
A better formula that handles the space between the two fields:
IF(ISBLANK('First Name'),"",'First Name'&"_") & 'Last Name'

B. Placing the Calculation Fields on your Printing Layout
1) First, go to the Layout mode. Delete any fields that you will replace with calculation fields. To delete a field, click once on the field, then press the Delete key. Delete any text objects, such as a comma, as needed.

2) Add the calculation fields to your layout
ClarisWorks: use the Insert Field command from the Layout menu

FileMaker Pro: Drag the Field Tool from the tool bar area on the left, into the Body of your layout. Release the mouse button, then select the first calculation field you want on the layout. Do not click the checkbox to add the field label. Do this again for each additional calculation field to add to the layout.

3) Position the fields: drag the field boxes into position. They can touch, but they should not overlap.

Sliding Up:
Sliding Up generally works in both FileMaker Pro and ClarisWorks, as long as the field boxes are not overlapping. To enable Slide Up -
ClarisWorks: Go to Edit Layouts or Layout Info and click the checkbox for Sliding Up
FileMaker Pro: Select all the fields on the Layout, then go to Sliding/Printing or Slide Objects.

Part 2 - Getting Slide Objects to Work In ClarisWorks
To get fields to slide properly when you print, follow these guidelines:

1) Fields cannot touch or overlap. Try increasing the view magnification to 200% to check this.

2) Field boxes in the same row need to have both the tops and bottoms of the field boxes aligned. The easiest method is to select the fields in a row, then use Align Objects to align the top edges. Then resize the boxes as necessary to align the bottom edges. To resize a field box, click once on a box to select it. Then drag the handle in the lower right corner.

Macintosh: Protecting the System Folder from Tampering

I need to prevent my users from changing or removing resources from their System Folders. Do you know of a good way to do this?

I have already made the System Folders invisible with ResEdit. Are there any potential problems with this approach?

This article has been archived and is no longer updated by Apple.
System Software 6.0.x will not run INITs from invisible files. Because your files are visible (but the folder is not), this should not be a problem. However, other applications may have problems with this method.

A better, but more expensive, solution would be to use a security package (such as Empower, from Magna) which supports password protection of specific folders. Another solution is Casady & Greene's Access Managed Environment (A.M.E.), an integrated security and virus program with numerous utility-like options (activities log, passwords, auto sign on/off, etc) for the individual or multiple users.

For more information, search the Technical Info library under: "Magna" and "Casady & Greene"

Aligning Database Fields (DB)

This is a portion of an article that originally appeared in the ClarisWorks Journal, the monthly publication of the ClarisWorks Users Group, Box 701010, Plymouth, MI 48170; (313) 454-1969; Fax: (313) 454-1965. Copyright ClarisWorks Users Group; reprinted with permission.

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.

Q. No matter how hard I try, I can't get the database fields to line up evenly in my ClarisWorks screen displays and reports. There must be a way to make this easier than just trying to align everything "by eye".

A. "Autogrid" is an invisible grid of rows and columns that "hides" behind your ClarisWorks screen. With Autogrid turned off, you can move objects anywhere on the ClarisWorks screen. With Autogrid turned on, all objects automatically line up with the nearest row or column on the grid.

Go to the Options Menu and make certain the Autogrid feature is turned on when you work with your database. (You know that Autogrid is on if the Options Menu includes the "Turn Autogrid Off" option.)

ClarisWorks' "Align" feature also makes it easy to line up rows and columns. Just select the objects you want to align, choose Align Objects from the Arrange Menu, and mark the appropriate boxes in the Align Objects dialog box that will appear on your screen.

Area Codes Disk

The ClarisWorks (CWUG) Public Domain Library now includes Bruce Shanker's Area Codes Disk. This disk contains three ClarisWorks database files with city names, area codes, time zones, and other information for more than 3,000 cities in the United States and throughout the world. ClarisWorks users who make long distance calls will appreciate these useful files that Mr. Shanker originally developed for AppleWorks and imported into ClarisWorks.

The ClarisWorks Users Group (CWUG) is an association that supports ClarisWorks users. CWUG provides technical support and information about ClarisWorks and enhancements to that program.

Cannot Multi-launch ClarisWorks from Novell Server (All)

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
After installation on a Novell Server, multi-launching from the server may not work when some people have Read/Write access and others only have Read access. If everyone has Read access only, everything works fine.

Solution:
1. In File Manager go to the CLWORKS directory. Select CLWORKS.RSR and under File get properties.

2. Click on the Network button, click on the checkbox for Sharable and close all the dialogs.

Claris CAD / Adobe Type Reunion Incompatibility

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.

Using Claris CAD 2.0v3 and Adobe Type Reunion (any version, currently 1.1). On some model Macs (IIfx and SE/30), XTND may not work properly. The symptoms: either the Show popup menu does not list any XTND file types, or the Show popup menu is missing entirely.

The problem seems to be CPU specific; that is, the problem does not seem to occur on a IIci or a Quadra 800. Other Macintosh models were not tested. These results are from an informal test by Claris Technical Support, not a comprehensive compatibility test.

ClarisWorks: Crashes after Install but Runs OK after Rebooting

This is a portion of an article that originally appeared in the ClarisWorks Journal, the monthly publication of the ClarisWorks Users Group, Box 701010, Plymouth, MI 48170; (313) 454-1969; Fax: (313) 454-1965. Copyright ClarisWorks Users Group; reprinted with permission.

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.

Q: ClarisWorks crashes immediately after I install the program but runs reliably after I reboot my system. Why would that happen?

A: The ClarisWorks installation routine creates some new folders and installs its files in those folders. Some systems cannot locate those files until you reboot your computer. Thus, you should always restart your Macintosh after using the Installer. [Ed: This is true for most sophisticated Macintosh applications, not just ClarisWorks.]

Use ClarisWorks' "Easy Install" routines whenever possible. That ensures that the files go in the correct folders. (For example, the "ClarisWorks Translators" file goes inside the Claris Folder that should be in your System Folder. The ClarisWorks Translators file is not an XTND translator and, therefore, does not go in the Claris Translators folder that also resides in the Claris Folder.)

ClarisWorks Runs OK on Certain Computers But Not on Others (All)

This is a portion of an article that originally appeared in the ClarisWorks Journal, the monthly publication of the ClarisWorks Users Group, Box 701010, Plymouth, MI 48170; (313) 454-1969; Fax: (313) 454-1965. Copyright ClarisWorks Users Group; reprinted with permission.

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.

Q: ClarisWorks runs reliably on the computers at my school but will not launch on my system at home. What might cause this problem?

A: When you launch ClarisWorks, the program performs a number of tasks including building a custom font menu, checking for viruses, locating the Claris Help, Dictionary, and File Translation files, and initializing memory. Thus, a crash at startup could indicate a problem with fonts, a problem with the disk or disk directory, a virus, a problem with the way you arranged the Claris support files, or a conflict with one of your system extensions. This is complicated, but not unmanageable.

Start by rebuilding your desktop; that is, boot your computer while you hold down the Command and Option Keys and respond "OK" to the on-screen prompt.

Next, check for conflicts between your system extensions (CDevs and Inits) and ClarisWorks by de-activating your extensions and then running ClarisWorks. [Ed: A "CDev" is a Control Panel Device that you can modify through the Macintosh Control Panel. CDevs show up as "Control Panel Documents" when you list the contents of the System Folder by name, date, size, or kind. "Init" is a generic term for any other system startup extension.]

If you use System 7, this process is easy; just hold down the Shift Key while you reboot your system. That will keep your System Extensions from loading. If you can then launch ClarisWorks, your problem is an Init or CDev. Remove them from your System Folder and then systematically reinsert them and reboot until you identify the problem.

If you use System 6.x, you must move all your Inits and CDevs from your System Folder to another folder and reboot. Then reinstall your system extensions one at a time, restart, and launch ClarisWorks until you identify the source of your problem. [Ed: You can identify the Inits and CDevs by viewing the contents of your System Folder by "Kind". That makes it easy to move all the Control Panel Documents and Startup Documents to a different folder.]

Finally, you should check for directory problems by running Disk First Aid, the Norton Utilities, MacTools, or some other disk utility.

ClarisWorks Tip: Create Two Views of your Database Documents

This is a portion of an article that originally appeared in the ClarisWorks Journal, the monthly publication of the ClarisWorks Users Group, Box 701010, Plymouth, MI 48170; (313) 454-1969; Fax: (313) 454-1965. Copyright ClarisWorks Users Group; reprinted with permission.

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.

Changing a database layout requires you to switch between Layout mode (where you format the layout) and Browse mode (where you see the effect of your changes). Of course, the need to repeatedly switch between modes can be tedious.

To increase your efficiency, create two views of the same data. Then you can display your document in both Layout and Browse modes simultaneously (see Figure 1) and immediately see your changes on the screen.

Follow these steps to create separate Layout and Browse views of your database file:

1. Display your database in Browse mode.

2. Choose "New View" from the View Menu. ClarisWorks will open another window with the same view of your document.

3. Choose "Layout" from the Layout Menu to change the new view to Layout mode.

4. Choose "Tile Windows" from the View Menu. ClarisWorks will arrange the windows so you can see both views on the screen. Any changes you make in Layout mode will immediately appear in the Browse mode view.

ClarisWorks Tip: Use ClarisWorks‘ BEEP and ALERT Functions in Spreadsheets and Databases (DB,SS)

This is a portion of an article that originally appeared in the ClarisWorks Journal, the monthly publication of the ClarisWorks Users Group, Box 701010, Plymouth, MI 48170; (313) 454-1969; Fax: (313) 454-1965. Copyright ClarisWorks Users Group; reprinted with permission.

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.

The BEEP and ALERT functions of ClarisWorks let you warn users of mistakes they make when using a ClarisWorks spreadsheet or database template.

BEEP sounds the system beep; ALERT sounds the beep and displays an alert box with the message you specify.

For example, the formula :

=IF(A10<0, ALERT("Illegal negative value in Cell A10"),A3*A10)

will display a warning message if cell A10 contains a negative number. Otherwise, this formula displays the product of cells A3 and A10.

Figure 1 contains a ClarisWorks spreadsheet template showing a warning message produced by the ALERT function.

VI. Use ClarisWorks Pane Tools to lock titles on your spreadsheet screen.

ClarisWorks lets you lock the top rows and left-hand columns of your spreadsheet templates as "titles" on the screen. The titles stay on the screen when you scroll around a large worksheet.

ClarisWorks titles go in a separate window "pane" at the top or left side of your screen. (For example, note the separate horizontal pane in Figure 2 that contains the titles at the top of the screen.) You create the pane by dragging the horizontal Pane Tool down the screen to set your titles. You can use the vertical Pane Tool to the right of the Zoom Controls at the bottom of the spreadsheet window to lock columns as titles on the left-hand edge of your screen.

VII. Use the NOW function to enter the current date or time in a spreadsheet cell or a database record.

The NOW function of ClarisWorks displays the current date or time in a spreadsheet cell or database record.

In a spreadsheet, enter =NOW() as the formula and set the number format of the cell to display a date or time. In the database environment, define the field as a calculated field, enter the formula NOW(), and select "Date" or "Time" from the "Format result as..." pull-down menu.

ClarisWorks Tip: Use Text and Graphic Frames in a Spreadsheet for Your Notes (WP,SS,DR)

This is a portion of an article that originally appeared in the ClarisWorks Journal, the monthly publication of the ClarisWorks Users Group, Box 701010, Plymouth, MI 48170; (313) 454-1969; Fax: (313) 454-1965. Copyright ClarisWorks Users Group; reprinted with permission.

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.

ClarisWorks lets you create text and graphic frames within your spreadsheets. You can use these frames to present instructions about the template or to annotate or highlight a particular spreadsheet cell or cell range (see Figure 1).

To annotate a cell, select the Text Tool and click and drag to create a text frame in the spreadsheet next to the information you want to annotate. Then enter the text you want to appear in your note. You can leave the text frame selected when you save your template and tell the reader to delete the text frame by pressing the Delete Key after they read the note.

You can also use the graphic tools to create an attractive border around the message like the example in Figure 1. Follow these steps:

1. Select the Rectangle Tool. Then click and drag in the spreadsheet to create a rectangle.

2. Select a fill pattern from the Fill Palette.

3. Select the Text Tool and click within the rectangle.

4. Select a font, font style, and font size from the Font, Size, and Style Menus. Then type the text you want in your label.

5. Select the Arrow Tool. Then click once on the text and resize and reposition the text block within the graphic.

6. Select the graphic and establish the final size and position for the graphic object.

IX. Use the tear-off fill and pen tool palettes.

ClarisWorks offers "tear-off" fill and pen tool palettes that you can put anywhere on your screen. To save time and effort, put the palettes next to the objects you are creating or modifying. The torn-off palettes remain open until you click on their Close Boxes.

To tear off a palette, click on the tool to open the palette and drag to the right until the palette tears away from the left edge of the screen.

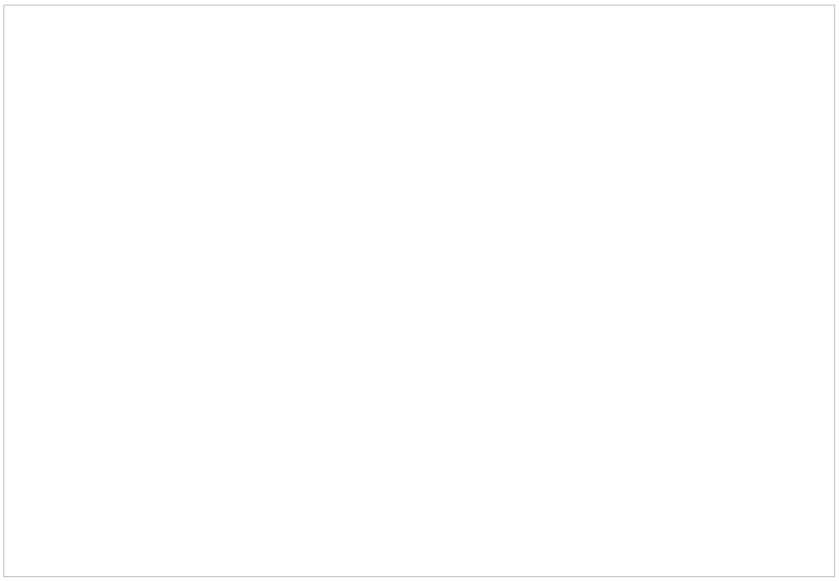

Figure 1

ClarisWorks Tip: Use the Command-(minus) Keystroke to Save Time Entering Data (DB)

This is a portion of an article that originally appeared in the ClarisWorks Journal, the monthly publication of the ClarisWorks Users Group, Box 701010, Plymouth, MI 48170; (313) 454-1969; Fax: (313) 454-1965. Copyright ClarisWorks Users Group; reprinted with permission.

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.

Pressing Command-(minus) enters the current date, time, or record number in date, time, and number fields respectively. That can save you time and effort when you enter data into your database records.

Converting Apple III Text Files to Macintosh

I'm trying to transfer some text files on Apple III disks to 3.5- inch floppy disks so I can open the files on a Macintosh. What cables and software are needed for this?

This article has been archived and is no longer updated by Apple.
If you still have the Apple III, the files can be transferred using Access III, MacTerminal, and either cable (Apple Part #) 590-0555 or cables 590-0169 AND 590-0550.

If using the Apple III serial card, have the card set to no modem eliminator. If using the built-in port C, make sure you're using the .RS-232 driver rather than the .PRINTER driver. You can find the .RS-232 driver for the built-in port C on the System Utilities Data disk.

Make sure both systems are set for the same baud rate, data bits, and so forth, and then simply set one system up to send a file and the other one to receive a file.

If only the disks are available, you can use this method. Because Apple III SOS and Apple II ProDOS are file-compatible, using an Apple IIe, Apple IIGS, or Apple IIc with both a 5.25-inch disk drive and a 3.5-inch disk drive, transfer the files to a 3.5-inch disk. Use AFE to transfer the files to the Macintosh disk.

Both of these options assume that the files are text-only. If they are QuickFile or Three Easy Pieces files, see the Tech Info Library for instruction on converting the files to Microsoft Works.

Another option would be to have an outside service, such as Pivar, convert the files for you.

For more information, search under: "Pivar"

ClarisWorks Tip: Use the Spell Checker to Count Words (WP)

This is a portion of an article that originally appeared in the ClarisWorks Journal, the monthly publication of the ClarisWorks Users Group, Box 701010, Plymouth, MI 48170; (313) 454-1969; Fax: (313) 454-1965. Copyright ClarisWorks Users Group; reprinted with permission.

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.

The Spell Checker included with ClarisWorks and ClarisImpact makes it easy to count the number of words in a document. Just perform a regular spell check. When you are done, these two Claris programs will display the number of words it checked in the document (see Figure 1). Since ClarisWorks and ClarisImpact check every word, the number next to "Words Checked" is the number of words in the document.

Remember that ClarisWorks can also count the number of words in your spreadsheet and text frames.

NOTE:
MacWrite Pro has a much more sophisticated system for counting words, sentences, etc. in a document without using the spell checker.

[ClarisWorks 3.0 has a feature in the Edit>Writing Tools menu for counting characters, words, sentences, etc.]

ClarisWorks Tip: Use the Spreadsheet Tool to Create Tables and Charts (WP,SS)

This is a portion of an article that originally appeared in the ClarisWorks Journal, the monthly publication of the ClarisWorks Users Group, Box 701010, Plymouth, MI 48170; (313) 454-1969; Fax: (313) 454-1965. Copyright ClarisWorks Users Group; reprinted with permission.

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.

The word processor environment of ClarisWorks provides the tabbing tools necessary to create tables and charts for your documents. But the Spreadsheet tool makes it even easier to align your text and numbers. Figure 1 depicts a word processor document that uses a spreadsheet to format tabular data.

Follow these steps to create a table in your documents:

1. Click and drag with the spreadsheet tool when you need to create a table or chart.

2. Set the column widths you need in your spreadsheet.

3. Enter the data into the spreadsheet cells and format the cells to meet your needs.

4. Choose "Display" from the Options Menu and turn off the grid lines, column headers and row headers to make the spreadsheet frame look like part of the text.

Creating a Letterhead Macro in ClarisWorks (WP)

This is a portion of an article that originally appeared in the ClarisWorks Journal, the monthly publication of the ClarisWorks Users Group, Box 701010, Plymouth, MI 48170; (313) 454-1969; Fax: (313) 454-1965. ©ClarisWorks Users Group; reprinted with permission.

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.

A Letterhead Macro

Let's create a macro that stores both text and formatting commands. This macro will produce a letterhead with a single keystroke, like the example in Figure 1.

ClarisWorks macros work more reliably if you select your choices from the menus instead of using the keystroke alternatives. Thus you should avoid using quick keys such as Command-A instead of choosing "Select All" from the Edit Menu. Don't worry if you make a mistake as you type; just use the Delete Key to erase your error and correct your work.

Follow these steps:

1. Create a new word processor document.

2. Issue a Command-Shift-J to start recording the macro.

3. Assign the macro to keystroke Option-Command-l (for "letterhead") and name the macro "Letterhead".

4. Type the text that will appear in the letterhead. Then press the Return Key five times to leave four blank lines.

5. Use the mouse to select "Insert Date" from the Edit Menu.

6. Press the Return Key twice to leave a blank line after the date. Your screen should now look like the example in Figure 2.

Your next task is to change the date format to match the example in Figure 3. Follow these steps:

7. Go to the Edit Menu and select "Preferences".

8. Click on the current date format and hold down the mouse button while you drag the mouse to a more appropriate format. Then click on the "OK" button.

You are now ready to format your letterhead. Proceed as follows:

9. Go to the Edit Menu and choose "Select All". Then choose a font from the Font Menu.

10. Highlight the lines of text you want to center and click on the Center Text icon on the ClarisWorks Ruler.

11. Put the cursor anywhere in the first line of text and triple-click to select the line. Then go to the Style Menu and select "Boldface".

12. With the first line of text still highlighted, select "14 point" from the Size Menu.

13. Click anywhere below the date to put the insertion point where you normally start typing.

14. Finally, stop recording the macro by issuing a Command-Shift-J. Alternatively, you can select "Macros" from the File Menu and "Stop Recording" from the Macros Menu.

Now test the macro by creating a new word processor document and issuing an Option-Command-l. The screen will flash as ClarisWorks creates your formatted letterhead.

Graphic File Formats (DR,PT)

This is a portion of an article that originally appeared in the ClarisWorks Journal, the monthly publication of the ClarisWorks Users Group, Box 701010, Plymouth, MI 48170; (313) 454-1969; Fax: (313) 454-1965. Copyright ClarisWorks Users Group; reprinted with permission.

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.

Many graphic programs store their files in a "native" file structure that you cannot read with other programs. However, users want to transfer images between applications, so programmers developed a series of common file formats that the industry now uses to share art created in graphic programs. The most commonly used file transfer formats are Paint, PICT, EPSF (also known as EPS), and TIFF.

Most programs can save their graphic images in multiple formats. For example, Paint programs can usually save in both Paint and PICT format files. Thus, you cannot determine the type of art stored in a file from the type of file on the disk.

As a ClarisWorks user, it is comforting to know that you can import art stored in any of the commonly used formats. But you should know the advantages and disadvantages of each format so you can select the most appropriate art for your application.

Paint Format

Paint format (also called MacPaint format) is the most limited of the file formats. Documents stored in Paint format can be no larger than 8 inches by 10 inches and must be a black and white image.

However, Paint format files are generally small, and art stored in Paint files often contains a great deal of visual detail.

Paint format art stores images in a single large bitmap, and thus offers the poorest resolution of all the graphic formats. For example, circles are not "objects" but instead consist of a series of darkened pixels that form the shape of a circle. As a result, the edges of the circle are not smooth, and enlarging the circle magnifies the "jaggies".

The resolution of Paint files also suffers because these files store shades of gray as patterns of white and black pixels. This can result in unpleasant patterns or stripes (called "banding") when you import these images into ClarisWorks.

Finally, the Paint programs used to create these files convert all text in the image into a bitmap. The text becomes part of the picture instead of a collection of letters, and any programs you use to improve text output will have no effect on the text in these files. In addition, Paint format files do not contain Postscript or TrueType information that your printer can use to enhance your output.

ClarisWorks can import Paint format files, and you can resize and rotate images stored in Paint files. However, you cannot edit these images.

PICT Format

PICT files are compact and can store black and white or color images. The PICT format does not set limits on document size or the number of colors used in your graphics; these limits depend on the application used to create the image.

PICT is the most flexible of the commonly used image storage formats because PICT files can contain images created with Paint or Draw programs. However, this flexibility can cause confusion because PICT art maintains the characteristics of the Paint or Draw program used to create each graphic.

Thus, PICT files created by a Paint program contain the same bitmapped images and suffer from the same resolution problems as bitmapped images stored in Paint format files. Specifically, (a) these images lack the resolution of objects drawn with Draw programs, (b) any text in the image is treated as a graphic, and (c) resized images can suffer from the "jaggies" and "banding".

ClarisWorks can import, resize, and rotate bitmapped graphics stored in PICT files but does not offer the tools you need to otherwise modify these graphics.

This stands in contrast to object-oriented art created by a Draw program and saved in a PICT file.

The object-oriented art uses the QuickDraw routines in your Macintosh to mathematically create the images that appear on the screen. Thus, art created with Draw programs maintain higher resolution when you resize or scale the image with ClarisWorks. In addition, images created with these programs automatically print at the highest resolution available from your printer. This is also true of text included in your images, since Draw programs use all the font enhancement technologies installed in your system.

Finally, and most importantly, ClarisWorks gives you the tools necessary to modify Draw images. You can import these object-oriented graphics

in ClarisWorks, ungroup the image, and edit the illustration.

EPSF

Bezier Draw programs can create high-quality, detailed images. These programs store their images in EPSF (for Encapsulated Postscript) format to capture all the detail in these drawings. EPSF files contain a PICT screen image and the Postscript language definition of the image for your printer. These images are optimized for Postscript printers but produce the highest quality output possible from any printer.

ClarisWorks can import, rotate, and resize images stored in EPSF files, but the program does not have the tools needed to edit these graphics.

TIFF

TIFF (Tag Image File Format) files, usually generated by scanning programs and high-end drawing programs such as Adobe PhotoShop, contain detailed information about a graphic. These files can store the most attractive and elaborate color graphic images. But the files are often enormous.

If you allocate enough memory to ClarisWorks, you can import, rotate, and resize TIFF format images with ClarisWorks. However, ClarisWorks does not provide the tools needed to edit these images.

Telling Them Apart

As a ClarisWorks user, you should know the type of art stored in a graphics file. This is particularly true because ClarisWorks lets you modify object-oriented but not bitmapped images. Thus, given a choice between two PICT files containing the same visual image, you should choose the object-oriented graphic instead of the bitmapped graphic.

Most clip-art libraries identify the file formats of the art on their disks. For example, the CWUG Public Domain Library includes disks with PICT, EPSF, and TIFF art. You know that you can import, resize, and rotate all the art. You also know that you cannot otherwise modify the EPSF and TIFF graphics.

The problem is determining what you can do with the art stored in PICT files, because those files can contain either bitmapped or object oriented art.

Dissecting PICT Files

Here is a way to use ClarisWorks to determine the type of art stored in a PICT file. Follow these steps:

1. Launch ClarisWorks and indicate that you want to create a new graphics document.

2. Select "Insert" from the File Menu. Scroll through the files on the Insert Window until you find the file you want to check, click on that file, and click on "OK".

3. Select "Ungroup Picture" from the Arrange Menu (or press Command-Shift-G) to ungroup the image. If the image was created in an object-oriented program, it will separate into several shapes, each with four "handles". You can modify the image with ClarisWorks.

If the object does not ungroup, the image was created in a Paint program.

Hanging Paragraphs Macros (WP)

This is a portion of an article that originally appeared in the ClarisWorks Journal, the monthly publication of the ClarisWorks Users Group, Box 701010, Plymouth, MI 48170; (313) 454-1969; Fax: (313) 454-1965. Copyright ClarisWorks Users Group; reprinted with permission.

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.

Let's create two macros that will help you format documents. The first macro will set the Ruler to produce a hanging paragraph. The second macro will return the Ruler to the default paragraph format.

Follow these steps to create a "hanging paragraph macro":

1. Select "New" from ClarisWorks' File Menu and indicate that you want to create a new word processor document.

2. Issue a Command-Shift-J or go to the Macro Menu and select "Record Macro" to indicate that you want to create a new macro.

3. Define the macro key as Option-Command-h and name the macro "Hanging Paragraph".

4. Put the pointer on the Left Indent Marker (the right-facing triangle at the one-inch mark) in the Ruler at the top of the screen.

5. Hold down the Option Key, then click and drag the Left Indent Marker to the 1-1/4-inch mark on the Ruler.

6. Stop recording the macro by issuing a Command-Shift-J or by selecting "Macros" from the File Menu and "Stop Recording" from the Macros Menu.

Test the macro by creating a new word processor document and issuing an Option-Command-h. ClarisWorks will reset the Ruler to accommodate an indented paragraph.

Now repeat the steps above and create a macro that resets the Left Indent Marker back to the one-inch position on the Ruler. Assign this macro to Option-Command-u ("Un-indent"). (You must hold down the Option Key to move the Left Indent Marker.)

Help System Cannot be Opened (All)

This is a portion of an article that originally appeared in the ClarisWorks Journal, the monthly publication of the ClarisWorks Users Group, Box 701010, Plymouth, MI 48170; (313) 454-1969; Fax: (313) 454-1965. Copyright ClarisWorks Users Group; reprinted with permission.

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.

Q. The ClarisWorks manual suggests that the program offers a help system. Yet every time I select "Help..." under the Apple Menu I get the message "Sorry, the Help stack cannot be opened." Why do I get this message?

A. The help system requires approximately 225K of free memory. If your system has less than 225K of memory available after you launch ClarisWorks, you get a message that says you cannot open the Help stack.

If you want to use the help system and don't want to add memory to your computer, follow these steps to reduce the amount of memory allocated to ClarisWorks:

1. Quit ClarisWorks and return to the Finder.

2. Navigate to the ClarisWorks Icon. Click on the Icon and choose "Get Info" from the File Menu (or press Command-I). The Get Info Window will appear. (See Figure 1.)

3. Set the Application Memory Size to a value 100K less than the present value (in this case, set the Application Memory Size to 800).

4. Click on the Close Box to close the Get Info Box.

5. Relaunch ClarisWorks and see if you can run the help system.

If not, repeat steps #1 through #5 until you access ClarisWorks' help system.

Hints for Transferring Files (All)

This is a portion of an article that originally appeared in the ClarisWorks Journal, the monthly publication of the ClarisWorks Users Group, Box 701010, Plymouth, MI 48170; (313) 454-1969; Fax: (313) 454-1965. Copyright ClarisWorks Users Group; reprinted with permission.

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.

As you know, the Claris XTND technology lets you transfer data between ClarisWorks and dozens of other applications. The list of translators is extensive, but not comprehensive. For example, Claris does not offer translators for PageMaker, Publish It!, or newly released programs such as Word 5.x and Microsoft Works 3.0.

The trick is to use a file format that you can read and write with both ClarisWorks and the other application. For example, Microsoft Works 3.0 can read and write Works 2.0 files. You can save your ClarisWorks and Works 3.0 documents in Works 2.0 format and transfer the Works 2.0 format file between applications.

Microsoft Word 5.x and ClarisWorks can both read and write Word 4.0 files. That lets you use Word 4.0 format files to transfer documents between Word 5.x and ClarisWorks.

Most programs can read and write Text files, but Text files do not contain any information about the fonts and format of your document. Thus, you should use a common application format (such as Word 4.0) or RTF (Rich Text Format) file whenever possible to preserve the format of your original document.

CWUG members who do extensive work requiring file transfers should contact DataViz, manufacturers of MacLinkPlus, a file transfer utility for the Macintosh. MacLinkPlus includes dozens of XTND translators that work with ClarisWorks, MacWrite II, and other Claris products that support the Claris XTND technology.

How to Add a Caption to a Graphic in Word Processor Documents (GR,WP)

This is a portion of an article that originally appeared in the ClarisWorks Journal, the monthly publication of the ClarisWorks Users Group, Box 701010, Plymouth, MI 48170; (313) 454-1969; Fax: (313) 454-1965. Copyright ClarisWorks Users Group; reprinted with permission.

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.

How to Add a Caption to a Graphic

Follow these steps:

1. Choose "Show Tools" from the View Menu (or press Shift-Command-T) to open the tool palette. Note that the Text Tool is selected in the palette, even though your graphic is selected in the document.

2. With the Text Tool selected, hold down the Option Key and click once to the right of the figure. Holding down the Option Key tells ClarisWorks to create a new text frame within the document.

3. Change the font to Helvetica 10 point italic.

4. Type "Figure 1:" and then your caption.

5. Press the Enter Key to select the text frame.

6. Drag the text frame or use the Arrow Keys to place the text to the right of the graphic.

How to Add Charts to Word Processor Documents (WP,SS)

This is a portion of an article that originally appeared in the ClarisWorks Journal, the monthly publication of the ClarisWorks Users Group, Box 701010, Plymouth, MI 48170; (313) 454-1969; Fax: (313) 454-1965. Copyright ClarisWorks Users Group; reprinted with permission.

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.

There are four ways to add graphics to a ClarisWorks word processing document:

1. You can use the graphics tools to create the graphic within the word processor document.

2. You can copy and paste the graphic from other ClarisWorks documents or from other applications.

3. You can use the Insert Command in the File Menu to insert a graphic stored in a file on a disk.

4. You can add a spreadsheet frame to your document and create a chart or graph from your spreadsheet data.

Whether you should create the graphic within the word processor document or in a separate document depends on your application. Graphics that you create within a document retain their position on the page and do not move with the text. You must manually drag and reposition the graphic each time you edit your text. Thus, you should create graphics within the document if you want to control their placement on the page.

How to Add a Chart

In this tutorial, you will use a spreadsheet frame to add a chart to your document.

You will add the chart to the top of the second column of the document. Follow these steps:

1. Open a new word processing document.

2. Select the Spreadsheet Tool from the tool palette. Then click and drag to create a spreadsheet frame that contains rows A and B and columns 1 through 5.

4. Enter data from Figure 1 into the spreadsheet.

5. Change the font in cell A1 to Geneva 10 point bold. This text will become the chart title.

6. Select cells A1 through B4. ClarisWorks will use the text in column A for the chart title and axis labels.

7. Choose "Make Chart" from the Options Menu (or press Command-M) to open the Chart Dialog Box.

8. Click on the line chart icon in the dialog box and select the options shown in Figure 2. (Do not select "Color" if you have a black and white monitor.)

9. Click on "OK" to create the chart. The line chart will appear as a graphic object on top of the report.

10. Use the selection handles to reduce the size of the chart so it is about three inches wide and three inches tall.

11. Drag the chart into the upper right corner of the document so it covers the spreadsheet frame (see Figure 3). Leaving the spreadsheet hidden in the document makes it easy to recreate the chart if you want to edit your data.

Now you will add a text frame that contains information about the source of your data. Continue as follows:

12. Select the Text Tool from the tool palette.

13. Create a new text frame by holding down the Option Key and clicking once within the chart border near the bottom of the chart.

14. Change the font to Geneva 9 point italic.

15. Type "Source: Antarctic Weather Bureau, 12/92" within the text frame.

16. Press the Enter Key to select the text frame. Then drag one of the right-hand handles further to the right until all the text fits on one line.

17. Use the Arrow Keys to move the text into place in the lower left corner of the chart.

18. Hold down the Shift Key and click on the chart to select both objects. Then choose "Group" from the Arrange Menu (or press Command-G) to group the objects together.

Your chart is now complete. Save your document.

If you ever need to change the data in the spreadsheet, select the chart and choose "Move To Back" from the Arrange Menu. The chart will move to the back layer, behind the spreadsheet frame. That makes the spreadsheet frame accessible. Any changes you make to the data in the spreadsheet will immediately appear in the chart; the link between the spreadsheet frame and the chart will remain intact unless you copy or cut and paste the chart. Then select the spreadsheet frame and choose "Move to Back" from the Arrange Menu to re-display the chart.

How to Insert Graphics in Your Word Processor Documents (GR,WP)

This is a portion of an article that originally appeared in the ClarisWorks Journal, the monthly publication of the ClarisWorks Users Group, Box 701010, Plymouth, MI 48170; (313) 454-1969; Fax: (313) 454-1965. Copyright ClarisWorks Users Group; reprinted with permission.

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.

There are four ways to add graphics to a ClarisWorks word processing document:

1. You can use thegraphics tools to create the graphic within the word processor document.

2. You can copy and paste the graphic from other ClarisWorks documents or from other applications.

3. You can use the Insert Command in the File Menu to insert a graphic stored in a file on a disk.

4. You can add a spreadsheet frame to your document and create a chart or graph from your spreadsheet data.

Whether you should create the graphic within the word processor document or in a separate document depends on your application. Graphics that you create within a document retain their position on the page and do not move with the text. You must manually drag and reposition the graphic each time you edit your text. Thus, you should create graphics within the document if you want to control their placement on the page.

How to Insert a Graphic

The "cut and paste" method you just used makes it easy to add ClarisWorks graphics to your word processor documents. But you cannot use cut and paste procedures to import clip-art and other files stored on a disk. Instead, you use the Insert Command to import graphics stored in PICT, TIFF, EPSF, and MacPaint 2.0 format files.

Follow these steps to import a graphic file into your document:

1. Scroll to the point in your document where you want the graphic to appear.

2. Click where you want to add the graphic and press the Return Key to add a blank line. Then click to put the insertion point at the beginning of the blank line.

3. Choose "Insert" from the File Menu, navigate to the disk or folder that contains the PICT, TIFF, EPSF, or MacPaint graphic file, and select that file. Then click on "Insert" to insert the graphic in the document.

Now you will size or "scale" your graphic. Continue as follows:

4. Click once on the graphic. A selection box will appear around the graphic with a "handle" in the lower right-hand corner.

5. Click on the handle and drag to resize and/or re-scale the graphic.

You can also use ClarisWorks' Scale Selection command to resize or re-scale the graphic. Select the graphic, choose "Scale Selection" from the Format Menu, and type a horizontal and/or vertical scale percentage in the dialog box. Then click on "OK".

Using an ADB Keyboard With the Macintosh Portable

Can the Apple Extended Keyboard be used with the Macintosh Portable? I will be using the keyboard while the Macintosh Portable charger is plugged in.

This article has been archived and is no longer updated by Apple.
Yes, the Apple Extended Keyboard (the original as well as the Extended Keyboard II) can be used with the Macintosh Portable, as can the Apple Standard Keyboard and other ADB devices that follow our specifications. The differences will be in key layout, battery drain, and waking up the Macintosh Portable.

The Apple Standard Keyboard draws a maximum of 100mA, and the Apple Extended Keyboard draws a maximum of 85mA. The Macintosh Portable keyboard and keypad (or trackball) together draw 75mA. From these numbers, you can see that adding the Extended Keyboard more than doubles the ADB power requirements. This decreases battery life somewhat. Since you will be using the Extended Keyboard with the charger plugged in, this shouldn't affect you.

Another point, though minor, is that the only way to manually wake up the Macintosh Portable is by pressing a key on the built-in keyboard. External ADB keyboards cannot provide this functionality. You will have to power up the Macintosh Portable by pressing a key on the built-in keyboard instead of the externally attached ADB keyboard.

How to Kern Headlines (WP)

This is a portion of an article that originally appeared in the ClarisWorks Journal, the monthly publication of the ClarisWorks Users Group, Box 701010, Plymouth, MI 48170; (313) 454-1969; Fax: (313) 454-1965. Copyright ClarisWorks Users Group; reprinted with permission.

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.

Kerning adjusts the space between pairs of letters to enhance the aesthetic quality and readability of your documents. You use kerning in body text to smooth the visual flow between letters ?? usually by decreasing the space between the characters. This is called "negative kerning". In headlines, "positive kerning" adds space between letters to produce an attractive effect.

Unlike dedicated page layout programs and some high-end word processors, ClarisWorks and ClarisImpact do not offer a kerning command. But you can achieve positive kerning by adding small spaces between characters in your headlines. Follow these steps to kern your headlines:

1. Type the headline.

2. Place the I-beam cursor between the letters that need kerning.

3. Go to the Size Menu and select a small size font. For sizes smaller than 9 points, use the "Other" option to enter sizes as small as 4 points.

4. Press the Space Bar to insert a space.

5. If the size of the space is not satisfactory, press the Left Arrow, and double-click. This selects the space; then return to step 3.

Also see article, "Use Bind Text to Apply Kerning in ClarisDraw"

How to Manage Smart Quotes (All)

This is a portion of an article that originally appeared in the ClarisWorks Journal, the monthly publication of the ClarisWorks Users Group, Box 701010, Plymouth, MI 48170; (313) 454-1969; Fax: (313) 454-1965. Copyright ClarisWorks Users Group; reprinted with permission.

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.

When you look at a ClarisWorks or ClarisImpact document, you will see that the program automatically implements some typographic features that enhance the quality of your printed material. Most obvious is the use of "printer's quotes" or "curly quotes" (the curly single and double quotation marks such as " and ') instead of standard Macintosh quotation marks (such as " or '). Printer's quotes add an elegant touch to your printouts.

Smart Quotes

ClarisWorks and ClarisImpact use a feature called "Smart Quotes" to put printer's quotes in your documents. The Smart Quotes feature looks at the character to the left of the insertion point and then determines whether an opening or closing quotation mark should appear in that location. By monitoring the insertion points, ClarisWorks automatically converts an opening or closing quotation mark into a printer's quote.

However, there are at least two situations when Smart Quotes are inappropriate. First, there are times when you may not want those fancy quotes (for example, when you use an apostrophe to abbreviate a length in "feet", a quotation mark to indicate "inches", or when preparing documents to be sent by modem). Second, there are times when Smart Quotes gets confused (for example, when you start a quote directly after another character, such as a left parenthesis).

Fooling Smart Quotes

Fortunately, there are workarounds that make it easy to overcome both of these problems. For example, you can follow these steps to force Smart Quotes to enter an opening quote:

1. Put the cursor where you want the opening quote to appear.

2. Press the Space Bar to insert a space. You will delete that space later, but now it signals Smart Quotes to type an opening quote.

3. Press the Quotation Mark Key to enter the opening quote character.

4. Move the cursor to the left of the opening quote character.

5. Press the Delete Key to delete the unwanted space.

Similarly, you can force ClarisWorks and ClarisImpact to type a closing quote by typing any character other than a space, typing the quotation mark, and then deleting the extra character. This can be useful when typing abbreviations for years, as in '92.

Turning off Smart Quotes

Turning off Smart Quotes gives you less attractive output but avoids occasional problems associated with using printer's quotes. With Smart Quotes disabled, ClarisWorks and ClarisImpact enter straight quotation marks in your documents. To turn off Smart Quotes in Claris Works, select "Preferences" from the Edit Menu (Layout Menu in ClarisImpact)and click in the Smart Quotes box on the Preferences Dialog Box. Standard (straight) quotation marks will then be entered in the current document until you reactivate Smart Quotes. [Ed: Note that the default setting for Smart Quotes in any new document is "on." However, Smart Quotes can be turned off when you prepare a Stationery file. Thereafter, documents prepared from the Stationery file will have Smart Quotes turned off.]

Remember to turn off Smart Quotes for any documents you will send by modem. The characters used by ClarisWorks for Smart Quotes do not match the ASCII character set. Thus, transmitted documents prepared with printer's quotes will usually contain a plus sign (+) in the place of either the single or double printer's quotes.

Getting Printer's Quotes When You Want Them

Fortunately, you can still get printer's quotes in your documents when you want them. Just press Option-[to enter an opening double-quote and Shift-Option-[to enter a closing double-quote. Similarly, Option-] and Shift-Option-] enter opening and closing single-quotes, respectively.

How to Paste Graphics in Your Word Processor Documents (GR,WP)

This is a portion of an article that originally appeared in the ClarisWorks Journal, the monthly publication of the ClarisWorks Users Group, Box 701010, Plymouth, MI 48170; (313) 454-1969; Fax: (313) 454-1965. ©ClarisWorks Users Group; reprinted with permission.

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.

There are four ways to add graphics to a ClarisWorks word processing document:

1. You can use thegraphics tools to create the graphic within the word processor document.

2. You can copy and paste the graphic from other ClarisWorks documents or from other applications.

3. You can use the Insert Command in the File Menu to insert a graphic stored in a file on a disk.

4. You can add a spreadsheet frame to your document and create a chart or graph from your spreadsheet data.

Whether you should create the graphic within the word processor document or in a separate document depends on your application. Graphics that you create within a document retain their position on the page and do not move with the text. You must manually drag and reposition the graphic each time you edit your text. Thus, you should create graphics within the document if you want to control their placement on the page.

Graphics that you paste or insert in a document move with the text. You should paste or insert graphics that you want to "flow" with the text.

How to Paste a Graphic

This tutorial describes how to copy and paste a graphic from another document (or another application) into a ClarisWorks document.

First, you will need to create a graphic; follow these steps:

1. Create a new graphics document. Then use the drawing tools to create a multi-object graphic; the quality of the graphic is not important.

2. Choose "Select All" from the Edit Menu (or press Command-A) to select all the elements in the graphic. Then choose "Group" from the Arrange Menu (or press Command-G) to group the graphic elements into a single object.

3. Choose "Copy" from the Edit Menu (or press Command-C) to copy the graphic to the clipboard.

Now you will paste the graphic into the middle of the first column of a two-column word processing document. Continue as follows:

4. Open the word processing document and scroll until the middle of the first column is visible on your screen.

5. Choose "Rulers" from the Format Menu, click on "Graphics", and click on "OK". This switches from the text ruler to the graphics rulers. The graphics rulers will make it easier to place the graphic precisely on the page.

6. Click where you want to paste the graphic (see Figure 1). Then press the Return Key to add a blank line. Click to put the insertion point at the beginning of the blank line.

7. Select "Paste" from the Edit Menu (or press Command-V) to paste the image from the clipboard into the document. The graphic will appear at the insertion point on the page.

How to Print Part of a Spreadsheet (SS)

This is a portion of an article that originally appeared in the ClarisWorks Journal, the monthly publication of the ClarisWorks Users Group, Box 701010, Plymouth, MI 48170; (313) 454-1969; Fax: (313) 454-1965. Copyright ClarisWorks Users Group; reprinted with permission.

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.

How to print a spreadsheet the way it appears on the ClarisWorks screen instead of printing the whole spreadsheet

Q. I use ClarisWorks' "pane" feature to split my spreadsheet screen and keep different parts of the spreadsheet in constant view. Is there any way to print the spreadsheet the way it appears on the ClarisWorks screen instead of printing the whole spreadsheet? If not, is there another way for me to print separate parts of the spreadsheet at one time?

A. There are at least two ways to get the output you want. One approach is to capture an image of your screen. A second technique is to "hide" the unwanted columns or rows in your spreadsheet.

The screen capture feature built into all Macintosh computers makes it easy to capture an image of any ClarisWorks screen. Press Shift-Command-3 any time you want to capture the screen; your Macintosh will create a Paint file called "Screen 0" (if you use System 6) or "Picture 0" (if you use System 7) . Your computer automatically names successive files "Screen 1", "Screen 2", and so on.

Then you can use ClarisWorks to view and print the image. Select "Open" from the ClarisWorks File Menu, click on the Import Options lever, and click on the Graphics Button. Then navigate to the root directory of the drive you use to store ClarisWorks and select the "Screen 0" or "Picture 0" file. ClarisWorks will create a new document that contains the screen image (see Figure 1). You can then print, rotate, or resize the image.

This is a bit-mapped image, so you cannot use ClarisWorks to edit the image. However, the article on page 4 of this issue of the ClarisWorks Journal describes how you can use a paint program to modify these screen-shot graphics.

Although it is easy to capture a screen image, your resulting output will include all the elements on the screen, including the ClarisWorks menus and the ÒframeÓ of the window. In addition, the bit-mapped image you capture does not produce high quality printing.

A more elegant approach is to "collapse" the spreadsheet rows and columns you do not want to appear in your printout. To do that, select the columns (or rows) you want to collapse and choose "Column Width" (or "Row Height") from the Format Menu. Type a zero in the dialog box and click on "OK". The columns and rows seem to disappear (see Figure 2).

For example, suppose you only want to print columns A through C and N through P. That means you want to collapse columns D through M. Select columns D through M and set their column widths to zero. When you print the spreadsheet, columns D through M will not print.

To restore (or "un-collapse") the columns, select the columns on either side of the collapsed section (in this case, columns C and N), and set the column width to its original size.

How to Transfer Data from ClarisWorks to FileMaker Pro (DB)

This is a portion of an article that originally appeared in the ClarisWorks Journal, the monthly publication of the ClarisWorks Users Group, Box 701010, Plymouth, MI 48170; (313) 454-1969; Fax: (313) 454-1965. Copyright ClarisWorks Users Group; reprinted with permission.

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.

Some of the power of ClarisWorks comes from its ability to export and import files to and from other applications. Unfortunately, Claris does not offer XTND translators to transfer files between the company's ClarisWorks and FileMaker Pro applications. However, transferring data between these applications is easy once you know the necessary steps.

Understanding DIF

The key to transferring data between FileMaker and ClarisWorks is to save the data in a file format recognized by both programs. Since both programs can export and import files in Data Interchange Format (DIF), and since database files in DIF retain their field names (unlike other available formats), you should use DIF files for these transfers.

DIF files include two types of records. The first records in the file contain information about the structure of the original database, including the field names and other information about the database file. The remainder of the DIF file contains the data organized so the importing application can create a new database that replicates the original source file.

Transferring a database from ClarisWorks to FileMaker is similar to the process you used to transfer a database from FileMaker to ClarisWorks. Proceed through these four stages:

Stage I. Prepare to Transfer Your Database

Before transferring your data, you should record some information to help you import your data into FileMaker.

Get the ClarisWorks database file on your screen and follow these steps:

1. Record an image of each ClarisWorks layout. To do that, select Layout from the Layout Menu to display a layout on the screen. Then capture or print the screen image using image capturing software. Later you can print those images with ClarisWorks. Certain combinations of Macintoshe computers and printers can create and print paint files via Command-Shift-3 or Command-Shift-4.

2. Write down each field name and field type in the file. Include the formulas you entered for every Calculation and Summary field.

3. Print a copy of each report you developed for the database.

Stage II: Export the Data as a DIF File

Now you are ready to create a DIF file that contains your ClarisWorks data. Follow these steps:

4. With the ClarisWorks database file on the screen, go to the File Menu and select "Save As..."

5. In the "Save As" Dialog Box on the screen, click on the file format button (which reads "ClarisWorks" in its default mode), then select the "DIF" option from the pop-up menu .

6. Enter a file name for your new file. Add the suffix ".DIF" to the end of the file name to help you identify the file. Then click on the Save Button.

7. Quit ClarisWorks.

Stage III. Import the DIF File into FileMaker

Your next task is to convert the DIF file into a FileMaker database. Continue as follows:

8. Launch FileMaker and click on "Cancel" if any dialog boxes appear. Then go to the File Menu, and select "New".

9. FileMaker will prompt you to create a new database. Navigate to the folder and/or volume where you want to store the new database file. Then enter a name for your FileMaker database and click on "New".

10. The Define Fields Window will appear on the screen; it looks like the example in Figure 1.

11.Type in the names of the fields and select their field types. You gathered this information in step #2 earlier.

12.Type in the formulas that you used in your ClarisWorks Calculation and Summary fields. Then click on ÒDoneÓ.

You are now ready to import records from the DIF file into the new FileMaker database.

13. Go to the File Menu and select "Import"

14. With the Import Window on your screen, click on "Import Records". FileMaker will display the dialog box that appears in Figure 2.

15. Navigate through the folders and disk volumes until you find the DIF file you created with ClarisWorks.

16. Double-click on the file name. FileMaker will display the window that appears in Figure 10. This window lets you select the fields that transfer into FileMaker. You want to import the complete ClarisWorks file into FileMaker; click on "Done". FileMaker will make all necessary conversions and will display the new database.

17. Issue a Command-S and save your new FileMaker database.

Stage IV: Enhance the New Database

Your ClarisWorks field names and records will translate into FileMaker. You do not have to define the field types; you did that earlier. However, you must still re-create your layouts. Continue as follows:

Recreating Layouts

18. Start by printing a copy of each layout that you saved as a paint or PICT file earlier.

19. Choose one of your printouts as the basis for a new layout in your FileMaker database.

20. Go to the Select Menu and select "Layout".

21. Refer to the printout and recreate the first layout by arranging fields and field names. To do this, click the mouse on a particular field or field name and drag it to the new location. Use the Alignment Command on the Arrange Menu to line up the fields and designators.

22. To change the appearance of field names or data, click on an item (or hold down the Shift Key as you click on a number of items) to select the item. Then, go to the Format Menu and select fonts, sizes, and styles to meet your needs.

23. Save your file; then print your new layout for future reference.

24. To prepare additional layouts for data entry or for your reports, select Layout from the Layout Menu, and repeat steps #21-23 for each screen format and report.

That completes the process of translating the FileMaker database into ClarisWorks. You can now add, edit, or delete records and print your reports as if you created the original database file with ClarisWorks.

Installation to a Novell server sometimes gives an Invalid Path error (All)

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
Installation to a Novell server sometimes gives an Invalid Path error.

There is some inconsistency with the MAP command on Novell. If the volume "TEST" is mapped to T: and a subdirectory CLWorks is mapped to V: and you try to install to the subdirectory by typing V:\\CLWORKS, you will get an Invalid Path error because the user doesn't have the correct privileges in the top level T:

Solution:
Typing T:\\MADMAX\\CLWORKS as the installation path will eliminate this mapping inconsistency.

Managing Your Macros in ClarisWorks (All)

This is a portion of an article that originally appeared in the ClarisWorks Journal, the monthly publication of the ClarisWorks Users Group, Box 701010, Plymouth, MI 48170; (313) 454-1969; Fax: (313) 454-1965. Copyright ClarisWorks Users Group; reprinted with permission.

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.

ClarisWorks stores all your macros/shortcuts in a file called "ClarisWorks Shortcuts". This file is located in the "Claris" folder which is located in the "System Folder". These macros/shortcuts are always available to all ClarisWorks files (unless otherwise specified). To make macros/shortcuts created on Computer A available on Computer B just copy the "ClarisWorks Shortcuts" file from Computer A to Computer B (NOTE: Computer B may already have a "ClarisWorks Shortcuts" file so don't delete macros/shortcuts that were created specifically for Computer B).

ClarisWorks stores your macros in collections called "sets"; it stores each macro set in a different file. You can create one large set that contains all your macros or create separate sets that contain macros for different ClarisWorks environments. For example, you can store all your word processor macros in one set, your spreadsheet macros in a separate set, and your communications macros in a third set. You can also develop customized macros for any specific project. For example, students can create their own sets of macros and store their personalized macros on their floppy disks.

Follow these steps to save your current set of macros:

1. Go to the Macro Menu and select "Save Macros". ClarisWorks will display the Save Macros Dialog Box .

2. Assign a file name to the set of macros and store the macro in a folder of your choice. We suggest that you add the suffix ".macros" to the file name and that you store all general macros in the ClarisWorks folder. You can store all task-specific macros in their respective task folders.

ClarisWorks lets you create a special set of macros called your "default macros" that it automatically loads when you launch ClarisWorks. To declare a default set, save your macro set in a file called "ClarisWorks Macros" in the ClarisWorks folder.

You make a macro set active by "loading" the set into ClarisWorks. Just select "Load Macros" from the Macro Menu and select the macro set you want to use. That set will remain active until you select a different set or quit ClarisWorks.

Menu Commands in the ClarisWorks Graphics Environment (DR)

This is a portion of an article that originally appeared in the ClarisWorks Journal, the monthly publication of the ClarisWorks Users Group, Box 701010, Plymouth, MI 48170; (313) 454-1969; Fax: (313) 454-1965. Copyright ClarisWorks Users Group; reprinted with permission.

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.

A list of all available menus in the Graphics Environment of ClarisWorks with descriptions of their functions and keyboard equivalents.

The Apple Menu

The Apple Menu lets you access a dialog box that provides information about your copy of ClarisWorks, including the serial number and the version number. From this menu you can also access the ClarisWorks' Help system (Command-?) and any Desk Accessories you installed.

ClarisWorks offers key combinations that duplicate commands available on the menus. "Command?" indicates that you can invoke the Help system by holding down the Command Key and pressing "?".

The File Menu

The File Menu allows you to control the features of the document as a whole. Here is a summary of the commands available in this menu:

New: Command-N. Lets you create a new document.

Open: Command-O. Lets you open an existing document.

Insert: Lets you insert a graphic created in another program and saved in PICT, TIFF, PAINT or EPS format.

To insert a graphic, follow these steps:

1. Go to the File Menu and select "Insert".

2. A dialog box will appear asking which file you would like to insert. Select the graphic you want to use and click on "Insert".

3. The graphic will appear in your document and be selected. You can move or re-size the graphic, but you cannot edit it.

Close: Command-W. Closes the current document. (Or click on the "close" box.)

Save: Command-S. Saves the current document.

Save as: Command-Shift-S. Lets you save the current document using a different name or as a Stationery (template) file or in PICT format.

Macros: Lets you create macros to automate procedures.

Mail Merge: Command-M. Lets you merge files for printing.

Page Setup: Lets you select the paper size, orientation, and some printer effects such as font substitution and precision bitmap reduction. (These options are printer-specific. See your printer manual.)

Print: Command-P. Activates the Print Dialog Box to let you print a document.

Quit: Command-Q. Quits ClarisWorks, prompting to see if you want to save any unsaved, open documents.

The Edit Menu

The Edit Menu lets you modify objects you created.

Undo: Command-Z. Undoes the last action you performed. The menu selection name reflects the action to be undone. For example, if you drew a square, the selection name will be "Undo New" and selecting it deletes the square. If you changed a fill color, the selection name will be "Undo Format" and selecting it reverts the fill to the original color. Once you select "Undo", it changes to "Redo" and lets you redo the action you just undid.

Cut: Command-X. Copies the selected objects or text to the clipboard and then deletes them from the screen.

Copy: Command-C. Copies the selected objects or text to the clipboard but does not delete them from the screen.

Paste: Command-V. Copies the objects or text from the clipboard to the document. In the case of text, it copies the text to the cursor location.

Clear: Deletes the selected objects or text. Has the same effect as pressing the Delete Key.
Select All: Command-A. Selects all unlocked objects in the current document.

Duplicate: Command-D. Makes a single copy of the currently selected object. The copy will be shifted to the right and down. It will be in front of the original.

Reshape: Command-R. Lets you move, add or delete individual vertices of a selected polygon.

Smooth: Command-(. Smooths the selected polygon by rounding all vertices.

Unsmooth: Command-). "Unsmooths" the selected polygon and returns all vertices to their angular shape.

Preferences: Activates a menu that lets you set some of the default values. These are broken into two categories: text and graphics. The text section lets you turn Smart Quotes on and off, turn Fractional Character Widths on and off, turn Auto Number Footnotes on and off, select the Starting Footnote Number, and select the Date Format. The graphics section lets you determine the number of selection points in an object, whether Polygon Closing is Automatic or Manual, and the degree of Shift Constraint.

Changing Polygon Closing to Manual means that a polygon will not close unless you double-click on the original vertex. If Polygon Closing is set to Automatic, the last point you draw will be connected to the starting point, closing the shape.

Changing the degree of Shift Constraint changes the constraint placed on moving objects, lines or polygons when you hold down the Shift Key. The Shift Constraint value must be between 0¡ and 45¡.

Note that the changes you make in the Preferences Dialog Box only effect the current document and any objects created after the change.

The Format Menu

The Format Menu lets you control the format of text and word processor frames. A few graphics-specific commands include:

Document...: Lets you control the size of the current document. You can set the margins, select the starting page number, select the numbers across and down, and turn Show Margins and Show Page Guides on and off.

Rulers...: Lets you control the appearance of the rulers. You can select Text or Graphics rulers. Text rulers appear only across the top of the page and show tabs, alignment and line controls. Graphics rulers run up the left edge and across the top of the page and do not allow any text control.

You can select the number of divisions on the ruler. Selecting "8" will divide each inch into 1/8th-inch markings.

Finally, you can select the units displayed on the ruler as inches, picas, points, millimeters or centimeters.

Arrange Menu

Move Forward/Move Backward: Command-Shift-+/Command-Shift--. Moves the selected object forward/backward one level in 3-dimensional space.

Move to Front/Move to Back: Moves the selected object to the top/bottom level.

Align to Grid: Command-K. The graphics environment offers an invisible grid that makes it easier to line up your objects. The grid divisions are set using the "Rulers" Command from the Edit Menu. Align to Grid lets you move the selected object to align with the closest grid division.

Align Objects:Command-Shift-K. Lets you align selected objects. A dialog box appears, letting you select the vertical and/or horizontal alignment you want to use. You must make selections on both sides of the dialog box.

Rotate: Command-Shift-R. Rotates the selected object by 90¡.

Flip Horizontal: Flips the object around the vertical axis.

Flip Vertical: Flips the object around the horizontal axis.

Group: Command-G. Groups the selected objects. After grouping, multiple objects can be moved and resized as if they were one object.

Ungroup: Command-Shift-G. Ungroups the selected group. The separate components can then be manipulated individually.

Lock: Command-H. Locks the selected objects. Locked objects cannot be moved, deleted or modified.

Unlock: Command-Shift-H. Unlocks the selected, locked objects. They can then be moved, deleted or modified.

Options Menu

Hide Graphics Grid: Hides the graphics grid. When the grid is hidden, this becomes "Show Graphics Grid" and selecting it causes the grid to appear.

Turn Autogrid Off: Command-Y. Turns off the Autogrid. The Autogrid causes shapes to "snap" to the grid when you are moving or drawing them. With the grid off, you can draw shapes of any size and move the shapes to any position. With the grid turned off, this menu selection title becomes "Turn Autogrid On" and selecting it turns the grid back on.

Scale Selection: Lets you scale the selected objects to the selected horizontal and vertical percentages.

Object Info...: Command-Shift-I. Lets you change one of the following three options, depending on the selected item:

Round Corners: Rounds the corners of the selected rectangle by a selected radius.

Modify Arc: Lets you alter the starting point and radius of the selected arc.

Modify Frame: Lets you change the format of the selected spreadsheet.

Frame Links: Lets you "link" text blocks so that text will flow from one to the next.

View Menu

The View Menu lets you create a new View Window of the current document, display the margins, and increase or decrease the scale of the view.

The View Menu also lets you show/hide the toolbar and the rulers, arrange the windows side by side in reduced size (tile), arrange the full-size windows one on top of the other (stack), and select a window to display at the front of the stack.

Payroll Master - Payroll Program for ClarisWorks

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.

ActaSoft recently announced the release of Payroll Master, which uses ClarisWorks to automate the payroll for a small or medium-size business. Payroll Master automatically produces gross and net weekly, biweekly, or monthly payrolls for any number of employees, and calculates Federal Withholding, Medicare, state taxes, and up to two user-defined deductions. The templates print forms W2 and W3 and post all totals to a report generator that prints payroll stubs and daily, weekly, quarterly, and annual reports.

Payroll Master which is compatible with AlphaCheck Mac, ActaSoft's automated checkbook and accounting package, lists for $95.

Replacing Invisible Characters in ClarisWorks (WP)

This is a portion of an article that originally appeared in the ClarisWorks Journal, the monthly publication of the ClarisWorks Users Group, Box 701010, Plymouth, MI 48170; (313) 454-1969; Fax: (313) 454-1965. Copyright ClarisWorks Users Group; reprinted with permission.

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.

ClarisWorks and ClarisImpact can find and replace tabs and returns. You can use this feature to replace a series of spaces with a tab or to delete "hard returns" from a document. That makes it easy to convert spaces to tabs in tables and remove blank lines or "hard returns" from documents you prepare or import into ClarisWorks.

The trick is to enter a Command-Tab or Command-Return after you invoke the Find Command. ClarisWorks will insert a "\\t" or "\\p" in the Find/Change Dialog Box (see Figure 1).

Replacing Spaces with a Tab

Follow these steps to replace a series of spaces with a tab:

1. Put the cursor at the beginning of a document and press Command-F (or select "Find/Change" from the Edit Menu).

2. Click in the Find Box and press the Space Bar to enter the number of spaces you will replace. Work carefully, because nothing will appear on your screen.

3. Click in the Change Box and enter a Command-Tab. The box will display a "\\t" (see Figure 1).

4. Click on "Find Next" and then change all of the strings of spaces to tabs.

Deleting Hard Returns

You create a blank line in Claris programs by entering two returns. The following procedure replaces two consecutive returns with a single return; thus this procedure deletes all blank lines from the document. Follow these steps:

1. Put the cursor at the beginning of the document.

2. Press Command-F to call up the Find Dialog Box.

3. Click in the Find Box and press Command-Return twice. That tells Claris programs to search for two consecutive Returns. The box will contain "\\p\\p" (see Figure 2).

4. Click on the Change Box and press Command-Return. The box will contain one "\\p".

5. Click on "Change All". Claris porgrams will replace all double returns with single returns, and the entire document will now be single spaced."

Macintosh IIfx: UN8 PROG CELL Socket Explanation

What is the function of the slot labeled "UN8 PROG CELL" on the Macintosh IIfx main logic board?

This article has been archived and is no longer updated by Apple.

The UN8 PROG CELL socket on the Macintosh IIfx logic board is for the parity memory controller.

This is only present on those Macintosh IIfx computers that are originally ordered with the parity option. There is no way to upgrade a non-parity Macintosh IIfx to have the parity option.

Sources for Macintosh-compatible Fonts (All)

This is a portion of an article that originally appeared in the ClarisWorks Journal, the monthly publication of the ClarisWorks Users Group, Box 701010, Plymouth, MI 48170; (313) 454-1969; Fax: (313) 454-1965. Copyright ClarisWorks Users Group; reprinted with permission.

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.

There are three general sources for Macintosh-compatible fonts: commercial fonts, shareware fonts, and public domain fonts. Within these categories, you will find bit-mapped fonts and outline fonts in multiple formats (PostScript and TrueType).

Apple includes a variety of fonts with its system software and with its printers. These fonts provide a good foundation for a font collection, but other sources offer more variety.

Bit-mapped Fonts

Today, there are virtually no commercial sources for bit-mapped fonts. However, you can still get bit-mapped fonts from font designers who put their fonts in the public domain or who distribute their fonts as "shareware" (where the user agrees to pay for a font if he or she decides to use the font). Shareware and public domain fonts are available from on-line services such as CompuServe, America Online, and GEnie, from resellers such as EduCom, or from computer user groups.

Outline / Scalable Fonts

Mail order vendors offer a large selection of commercial outline fonts at discounted prices. Retail computer stores offer them too, but their collections are often less complete. Adobe, Bitstream, and Casady and Greene are the major commercial "font foundries" for PostScript and TrueType fonts, but there are others (e.g., FontBank).

In an innovative marketing approach, Adobe recently put their entire font collection on a CD-ROM in a "locked" format. When you buy the disk, the company gives you the passwords to unlock the font combinations you select. Later, if you want additional fonts, you simply pay a fee for the necessary passwords.

Developers also produce outline fonts that they put in the public domain or distribute as shareware. In the case of shareware fonts, the font you initially receive may not include all the characters, but the shareware designer will send a disk with the full version when you remit the shareware fee.

Commercial fonts are usually well-designed throughout, but the visual quality of shareware and public domain designs varies, so test these fonts thoroughly before including them in your collection.

A Legal Note

Several shareware and public domain fonts produce documents that look identical to those printed with available commercial fonts. This might seem like an infringement of copyright, but it can be legal.

Under U.S. copyright law, any shape that can be read by a human as part of a character set cannot be copyrighted. So, it is possible to legally duplicate a commercial outline font, as long as you meet two conditions:

1. The code sent to the printer to reproduce the characters cannot be the same as the code sent by the original font.

2. You cannot use the original font name.

Note that it is a violation to copy outlines of symbols such as the character included in all Adobe fonts for the Macintosh and other special characters, such as "dingbats".

System 7.1 Update Problems (All)

This is a portion of an article that originally appeared in the ClarisWorks Journal, the monthly publication of the ClarisWorks Users Group, Box 701010, Plymouth, MI 48170; (313) 454-1969; Fax: (313) 454-1965. Copyright ClarisWorks Users Group; reprinted with permission.

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.

Some CWUG members report that they cannot transfer ClarisWorks files into other applications after they install System 7.1. The problem manifests itself by either not letting you export files from ClarisWorks into other applications or by creating files that you cannot read with the other application.

The CWUG members who experienced difficulties all used Apple's System 7.1 updater package for System 7.0 and 7.01. The problem did not occur when members installed Apple's complete System 7.1 package.

However, you do not need the complete System 7.1 package. If you cannot export your ClarisWorks files, just reinstall ClarisWorks after you update to System 7.1.

CWUG member Steve Taffée suggests that you also replace the Claris translators (in the Claris Translators Folder in your System Folder) whenever you experience problems importing or exporting files. Then use the Finder to remove the "XTND Translator List" file from your System Folder (for System 6.x users) or the Preferences Folder within your System Folder (for System 7.x users). ClarisWorks creates this file to keep track of its translators and does not notice changes in the translators unless you force the program to recreate the file.

We remove the XTND Translator List file from our System at the first sign of problems with the translators. ClarisWorks recreates that file the next time you launch the program.

Three Ways to Align Objects (GR)

This is a portion of an article that originally appeared in the ClarisWorks Journal, the monthly publication of the ClarisWorks Users Group, Box 701010, Plymouth, MI 48170; (313) 454-1969; Fax: (313) 454-1965. Copyright ClarisWorks Users Group; reprinted with permission.

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.

ClarisWorks gives you three ways to align objects on the page:

Align Objects Command: The Align Objects Command on the Arrange Menu aligns the tops, bottoms, centers, and left or right edges of any two or more objects.

Autogrid: The Autogrid feature automatically jumps objects to the nearest grid coordinates. With Autogrid on, you either:

1. Drag objects close to their desired position and let ClarisWorks place the objects in their final position, or

2. Use the Arrow Keys to move the selected object(s) one grid space with each Arrow keypress.

"Visual" Alignment: Both the Align Objects and Autogrid features align objects mechanically, not "visually". For example, neither approach makes it easy to line up the end of a diagonal arrow with the center of a word.

To align objects visually, turn the Autogrid on and use either the mouse or Arrow Keys to place the objects close to their desired positions. Then turn the Autogrid off and use the Arrow Keys to "nudge" the selected objects into their final positions.

Transferring Bank Street Writer Files (WP)

This is a portion of an article that originally appeared in the ClarisWorks Journal, the monthly publication of the ClarisWorks Users Group, Box 701010, Plymouth, MI 48170; (313) 454-1969; Fax: (313) 454-1965. Copyright ClarisWorks Users Group; reprinted with permission.

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.

Q. Is here any way to read my Apple II Bank Street Writer files into ClarisWorks?

A. Yes, just follow these steps:

1. Boot your Apple II with Bank Street Writer. Press the Escape Key repeatedly as the program boots; Bank Street Writer will display the Utility Program Menu.

2. With the Utility Program Menu on the screen, select #2 ("Convert Writer File"). Then follow the prompts that tell Bank Street Writer to convert your file from Binary to Text. Enter the file names and disk drives that contain your disks. Otherwise, accept all the default entries that appear on this screen. Bank Street Writer will create a ProDOS text file.

3. Launch ClarisWorks and follow the directions from your manual that describe how to import AppleWorks word processor files.

You can use similar procedures to transfer documents into ClarisWorks from any Macintosh, Apple II, or MS-DOS program that can produce ASCII (Text) files.

Using a Command Symbol in ClarisWorks (WP)

This is a portion of an article that originally appeared in the ClarisWorks Journal, the monthly publication of the ClarisWorks Users Group, Box 701010, Plymouth, MI 48170; (313) 454-1969; Fax: (313) 454-1965. ©ClarisWorks Users Group; reprinted with permission.

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.

A letter in the August/September 1992 issue of the ClarisWorks Journal indicates that you cannot include a Command (Command) symbol (also called a "quadrille") in a ClarisWorks document. Our thanks to the more than a dozen CWUG members who sent us their favorite workarounds for this problem. Most of these letters described how to create the Command symbol in a graphic or word processing program and import the symbol into ClarisWorks.

The most elegant solution we found was one developed by CWUG' Public Domain Librarian, Nanette Luoma, who created a ClarisWorks-compatible font that contains the Command symbol. You add the font to your system and relaunch ClarisWorks. From then on, you can select the font and type a Q to insert a Command symbol in a document.

You can even create a ClarisWorks macro that switches to the Quadrille font, types the Command symbol, and returns to your default font.

CWUG's new Command Symbol Font Disk includes both Postscript and TrueType versions of the Quadrille font. ClarisWorks users running under System 7.x should copy the font into the System Folder and restart their Macintosh. CWUG members using System 6.x should use Font DA Mover to install the font in their system.

The Command Symbol Font Disk costs $6 plus $2 s/h per order from the Public Domain Library, CWUG, Box 701010, Plymouth, Michigan 48170; (313) 454-1969; Fax: (313) 454-1965.

Using Sticky Spaces (WP)

This is a portion of an article that originally appeared in the ClarisWorks Journal, the monthly publication of the ClarisWorks Users Group, Box 701010, Plymouth, MI 48170; (313) 454-1969; Fax: (313) 454-1965. Copyright ClarisWorks Users Group; reprinted with permission.

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.

Q. Why doesn't ClarisWorks automatically keep the date with the name of the month when you get to the end of a line? Is there any way to keep words and phrases together when they appear at the right margin?

A. What you need are "Sticky Spaces", which tell ClarisWorks not to split two words at the end of a line. Typing Option-Space puts a "sticky space" in your document. (ctrl-space in Windows) This works in ClarisWorks and most other applications.

This solution works in most Claris programs.

What You Should Know about Italics and Boldface (WP)

This is a portion of an article that originally appeared in the ClarisWorks Journal, the monthly publication of the ClarisWorks Users Group, Box 701010, Plymouth, MI 48170; (313) 454-1969; Fax: (313) 454-1965. Copyright ClarisWorks Users Group; reprinted with permission.

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.

This article describes how the Macintosh manages italics, boldface, and other font styles. The goal is to help you produce more attractive documents with ClarisWorks.

Font Families

Professional font designers create "families" of fonts. Most font families contain Roman, italic or oblique, boldface, and other fonts that the designer creates with common design elements.

For example, Goudy Old Style is available in Roman, italic, bold, bold italic, extra bold, heavyface, and heavyface italic. The fonts are designed to work together to produce attractive documents.

Font vendors sell fonts in "collections", each of which includes different fonts from the same family. For example, Adobe sells two collections of Goudy Old Style fonts. The Goudy 1 disk contains the basic fonts, including Roman, italic, bold, and bold italic. The Goudy 2 collection includes the extra bold, heavyface, and heavyface italic fonts.

You should install all the fonts included with each family. Every font you install will appear on the Font or Format Menu within ClarisWorks.

How to Use the Fonts

ClarisWorks gives you three ways to choose between the different styles. First, you can select the appropriate font from the ClarisWorks Font or Format Menu. (Figure 1 shows the ClarisWorks word processor Font Menu with the seven different forms of the Postscript Goudy font installed in my system. Figure 2 shows the same menu after installing Type Reunion, Adobe's system extension that organizes your Font Menu.)

You can also switch between the Roman, italic (or oblique), and bold versions of a font by selecting the "standard" (Roman) version of the font from the Font Menu. Then you choose Plain Text, Italic, or Bold from ClarisWorks' Style Menu. ClarisWorks will check your system for the appropriate font and use the correct font for your text.

Finally, you can use the Command-T, Command-I, and Command-B keystrokes to switch between these fonts.

Each font you add to your system takes up space on your hard disk, in memory, and on the Font Menu. So some Macintosh users only install the Roman (or plain text) version of their Postscript fonts. Selecting Plain Text, Italic, and Bold from the Style Menu still produces different fonts, which look superficially like the italic and boldface fonts provided by the font vendor. However, the differences between these mathematically calculated fonts and the fonts provided by the font developer are apparent if you compare the true italic fonts to the fonts "created" by your Macintosh.

Italics Versus Oblique

With the italics font missing, the Macintosh creates a new version of the selected letters, all of which slant to the right by about 15 degrees. This slanted font is more correctly called an "oblique", not an "italic" font.

There is nothing inherently wrong with an oblique font. In fact, oblique fonts work well with sans serif typefaces and often come with those font families. However, you rarely use oblique styles with serif fonts such as Times and Goudy because the slanted strokes are in disharmony with the horizontal orientation of the serifs in the letter forms.

Font developers avoid this problem by designing true italics, which are cursive characters with the look of hand-lettering. Of course, the mathematical approach does not consider design issues. Thus, calculated slanted letters often have awkward serifs, flares, and other elements. Figure 4 shows the difference between Goudy Italic and the mathematically generated oblique substitute that the Macintosh generates if you command italic without the Goudy Italic font installed in your system.

The lesson is clear: Make certain that you install all the fonts in each family.

Printed Output

As with most ClarisWorks documents, your printed output depends on a combination of the fonts in your system and your printer. Without the

italic font, ClarisWorks prints oblique characters on an ImageWriter or QuickDraw laser printer. However, Postscript devices print the document using the Roman version of the font with incorrect line breaks.

Although you can save disk space and memory by not installing all the font styles in a family, doing so seriously compromises the visual impact of your ClarisWorks documents.

Mixing Fonts

Type designers keep the general characteristics of the parent font in mind when they create an italic or boldface version of a font. However, the difference between the two is usually so strong that you can often use the italic from one font family with the Roman characters of another. This is particularly true of serif fonts like Times, Goudy, Palatino, and New Century Schoolbook.

For example, Palatino includes exaggerated serifs, a wide range of character widths, and wide capital letters that draw lots of attention. These characteristics combine to yield a typeface that is lively and daring. That makes it a good candidate to try with italics from other font families. Figure 5 presents some examples.

This approach also works with many other serif fonts. For example, the ClarisWorks Journal uses Times italic with Goudy Oldstyle Roman, with no loss of design integrity. [Ed: This is Goudy italic, which we find less readable than Times italic because of the extra swashes on many characters. This is our standard Times italic, which we find more readable.

Conclusion

Producing visually appealing documents with a computer is a blend of skill and art. Although there is no substitute for experience with different font combinations, the following guidelines should help you produce more attractive documents:

1. The slanted and boldface fonts created by the Macintosh do not offer the subtle adjustments incorporated by professional designers. Make certain that you install the italic or oblique and boldface versions of all the fonts you use with ClarisWorks.

2. Experiment with mixed standard and italic fonts in documents printed with serif fonts such as Times, Goudy, Palatino, and New Century Schoolbook.

3. Always judge your fonts by your printed output, not their quality on the screen. The Macintosh screen's 72 dots per inch (dpi) resolution does not show how your work will look at 300 dpi or greater, especially in sizes under 24 points.

MacDFT: Support With IBM 3274 Cluster Controller

I am trying to configure the 3274-51C cluster controller. The IBM people said that the cluster controller has four types of configuration, A, B, C, and D. This cluster controller has "Configuration Support A-C", and extended memory is needed for "Configuration Support D".

1) Can I connect the Macintosh to the 3274-51C setup with "Configuration Support A, B, or C"?

2) Will MacDFT run this way?
This article has been archived and is no longer updated by Apple.
Twelve different models of the 3274 are available. The suffix after the model number indicates the environment in which the controller is used.

- The "A" suffix indicates a channel-attached SNA environment.

- The "B" and "D" suffix indicate a channel-attached non-SNA environment.

- The "C" suffix indicates a remotely attached environment.

Models 21, 31, and 41 support up to 32 attached devices. Model 51 supports 12 devices, and Model 61 supports 16 devices.

Most 3274 control units are capable of supporting DFT devices. Generally, the hardware does not determine whether a control unit can support DFT. Rather, the control units' microcode software supplies the additional function necessary to support DFT. However, minimum memory requirements are necessary for DFT support. In some cases, 3274 control units may require memory upgrades to have enough memory for DFT support.

Assuming you have enough memory, MacDFT will run with the above configuration if the controller microcode is 65 or higher. In remote bisynchronous, you can run MacDFT only in CUT mode.

Which Font to Choose for Tables (SS)

This is a portion of an article that originally appeared in the ClarisWorks Journal, the monthly publication of the ClarisWorks Users Group, Box 701010, Plymouth, MI 48170; (313) 454-1969; Fax: (313) 454-1965. Copyright ClarisWorks Users Group; reprinted with permission.

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.

Most ClarisWorks users realize that proportionally-spaced fonts (like Palatino or Times) produce more attractive output than their mono-spaced cousins (such as Monaco or Courier). That is because the designers of proportionally-spaced fonts adjust the space allocated to each letter to accommodate the different widths of the various letters. For example, proportionally-spaced fonts allocate less space for the letter "i" than the letter "m". By contrast, mono-spaced fonts allow the same space for each character. The designers of these typefaces often "squeeze" and "stretch" the horizontally to fill their allocated space. As a result, words like "mimic" and "medium" often look distorted in your documents.

However, allocating different widths to each character would make it difficult to use proportionally-spaced fonts in any document that includes columns of numbers. Fortunately, font designers recognize that numbers must line up in columns, so most professionally designed fonts include mono-spaced numbers. As a result, you can use almost any well-designed proportionally-spaced font in your ClarisWorks spreadsheets.

Numbers entered with text characters will be seen as text with numeric value of 0

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.

Typing a comma or a dollar sign in a numeric entry in a spreadsheet cell will cause Resolve to see the entry as text, rather than as a number. The result is that the entered value will be aligned left and will not be usable in a calculation. (The text value will be seen to have a numeric value of 0)

To solve the problem, remove any non-numeric characters from the cell. To have the numeric value show up as currency, select the cell, choose CURRENCY under NUMERIC in the FORMAT menu.

Linking Spreadsheets Using Publish & Subscribe (SS)

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.

It is often asked if it is possible to link the data in two ClarisWorks Spreadsheets like Excel. Although there is no linking feature, Publish & Subscribe works just as well. ClarisWorks only publishes the data that is selected and the subscriber can include the subscribed data in a calculation. ClarisWorks only requires the Published document to be saved in order to update the Subscriber.

This solution also works with ClarisImpact Table Models.

MacDFT: Running On A Token Ring Through PS/2

I'm installing Macintosh IIci systems with TokenTalk NB Cards using MacDFT software. I will be routing the packets through a PS/2 with an AppleShare PC Card installed to their front-end processor (3745) to the host. I want to be sure that I won't have any problems routing their packets through the PS/2.

This article has been archived and is no longer updated by Apple.

First, we are not clear how the AppleShare PC Card is used in this situation since it is not needed for communication to the host.

We assume that the PS/2 is on the Token Ring that is attached to the front-end processor using a Token Ring Interface Coupler (TIC). MacDFT 1.1 running over the TokenTalk NB Card on the same Token Ring can communicate directly to the TIC/front-end processor without going through the PS/2.

Printing a List of Questions with the Answers to Each (DB)

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
Q: How can I make a report of my survey database in the format:

Question 1:
Answer (person 1)
Answer (person 2)
Answer (person 3)

Question 2:
Answer (person 1)
Answer (person 2)
Answer (person 3)

A: With ClarisWorks, there are 2 approaches you can choose from. One is to create the fields Question Number, Answer and Person. Each record in the database would be the answer to a single question with the question number noted. A sub-summary layout part by Question Number with the Question Number field in the sub-summary and the Answer and Person field in the Body part would give you the printout you want. The downside to this approach is that all a person's answers aren't kept together in one record.

The other approach is to create a field for each question and also a layout for each question. One by one, you would switch to each layout, select all records and copy. By pasting into a WP document, you could assemble the desired report.

FileMaker Pro 2.0 offers a third approach. It can produce this report using repeating fields and a 2-database design where you import repeating fields from the data entry file and split them into separate records. This is demonstrated in the Survey Analysis file of the cross referenced article.

Updater Generates an Error

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
Claris updaters combine your original software with a list of changes and create a new, completely up-to-date application. For this to work correctly, you need to have a previous version that it can update. There are several reasons why an updater might generate an error message.

Incorrect Version
For instance, the ClarisWorks 2.1v2 updater can update version 2.0v1, but not 1.0, since there was a major upgrade between 1.0 and 2.0 which costs $99 and includes a new set of manuals and disks.

Non-U.S. Version
Updaters only work with standard U.S. Macintosh versions. Trying to update an International or site-licensed version will result in an error message.

Application was modified
The updater is very particular about what it will and won't update. The application has to be unmodified, so if you used ResEdit or any other utility to change any resources, you won't be able to use the Updater on that copy. Application corruption can also cause error messages. In both cases, simply install the application from your original diskettes and run the updater on the unmodified application.

Bad Download
When downloading an updater, there is no guarantee that it will download cleanly. Phone noise and other anomalies can cause faulty transmissions. How can you tell if corruption was introduced during downloading? Click once on the Installer and choose Get Info from the File menu. If either of the memory settings is set to zero, then the download was unsuccessful and you will need to try downloading it again. The same applies to the Updater itself. If you click on it once, choose Get Info, and see memory settings set to zero, then that copy may be corrupted as well. This type of corruption can often result in a -50 error message.

If the Updater Doesn't Work for You
If you think your version meets all the requirements above and the updater is unsuccessful:
1. Re-install the application from your original diskettes,.
2. Restart your Macintosh and hold down the shift key until you see the message "Extensions Off". If you have System 6, follow the instructions for disabling INITs in the System Crashes & Bugs document in this folder.

3. Run the updater on the fresh application you just installed.
4. If the update is still unsuccessful, and you got a system error as opposed to a "resource is different" error, try increasing the amount of memory allocated to the updater. Click on the updater icon once to select it and choose Get Info from the File menu. Increase the preferred size by 200K if you have enough memory on your Macintosh to accommodate that.
5. Download another copy

If the update is still unsuccessful, call Apple Technical Support.

Below are some of the known Updater error messages which can occur:

ALRT 400
The ClarisWorks 2.1v4 updater does not update the Power Mac version of ClarisWorks 2.1v3.

BNDL 128 resource is different
Some ClarisWorks owners modify the ClarisWorks file icons with ResEdit to show the environment a file was created in. This generates a BNDL 128 error. Re-install a fresh copy of the ClarisWorks application using original disks, and run the updater on that copy.

BOBO resource is different
This is caused by running the ClarisWorks 2.1v2 Mac U.S. updater on a Canadian version.

CODE 1 resource is different
FileMaker Pro customers should be directed to simply replace the FileMaker Network file with the one in the updater folder. They do not need to run the 2.1v2 updater because they already ran a previous release. Only the FileMaker Network file was changed in the re-release, to fix a Power Macintosh bug.

CODE 17 resource is different
Restart your Macintosh and hold down the Shift key until you see the message "Extensions off." The n run the updater. This error has been reported by Performa owners updating ClarisWorks 2.0 and seems to be related to a standard Performa extension.

Curs 25001 Resource is different.

TA42501_Updater_Generates_an_Error.pdf

This message is due to a program that has made changes to the cursor. (Application was modified). Simply install the application from your original diskettes and run the updater on the unmodified application

DITL #129 resource is different
Claris Corporation modifies DITL #129 for site licensed software. As a result, some updaters are not compatible with site licensed software. In addition, a reseller version of ClarisWorks 2.1 was built for ComputerWare with a special splash screen which contains a legal agreement that specifies that the software should only be used internally.

DITL #130 resource is different
The ClarisWorks 1.0v4 Updater generates a DITL 130 error and aborts updating when used on a copy of ClarisWorks which came pre-installed on a Performa. Currently, this is only a known problem with ClarisWorks 1.0v3 Performa. The 1.0v4 update is only necessary for ClarisWorks owners who need to open ClarisWorks for Windows files. Customers who receive the DITL 130 error and need to open Windows files should be shipped a free 1.0v3 - Program replacement disk. They will be able to install and update that copy of the ClarisWorks application.

Error -21 or Error -22
You may receive this error when attempting to update on a Power Macintosh. Increase the application memory by highlighting the updater application icon, then go to the File menu and select Get Info. Increase the the memory to 3000K in the preferred memory box. Then try updating again. In general, applications not written specifically for the PowerMacs require more memory to run properly under emulation.

Error -37
Attempting to save the updated application to the same location as the application being updated and changing the default saved file name to the same name as the old application will generate a -37 error message after Okaying the dialog asking to replace the file. After quitting the Updater, the original, unchanged application can be found in the trash. Simply saving the updated application using the default file name, "New <application name>", avoids the problem. (Fixed in UpdateMaker 2.1)

Error -50
Most likely a corruption introduced during downloading. Follow the troubleshooting steps above and if they donÕt work, try downloading it again.

SIZE 1 resource is different."
The Claris Organizer 1.0v2 updater generates the message: "Could not update 'Claris Organizer' because it is not the file that this update is designed for - the SIZE 1 resource is different." This message indicates that the memory allocation for Claris Organizer has been adjusted . The updater will work properly if you change the memory settings back to their original settings: The Minimum Size "800" and Preferred Size"1200". Once you have changed the memory allocation back the original size then run the Claris Organizer 1.0v2 Updater.

Other Notes
LaserPro copy protection modifies the application and prevents updaters from working properly.

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
ClarisWorks does not include direct support for dialing a telephone. This decision is based, in part, on Apple Computer's stated goal of introducing modular telephony extensions for system software. This would give phone dialing abilities to all applications, rendering any custom efforts we could build into ClarisWorks obsolete (and possibly prone to error) when the telephony extensions are introduced.

Currently there are a few options that you can try to use for phone dialing through third party software:
* Desktop Dialer. a combination ADB device and Apple event-aware desk accessory. Modest RAM and hardware requirements. Eliminates the need for a modem or a connection to the Macintosh sound port for dialing a phone. Costs $75. Sophisticated Circuits Inc., 19017 120th Ave. N.E., Suite 106, Bothell, WA 98011, (800) 827-4669, (206) 485-7979, fax (206) 485-7172.

* QuicKeys 2 & most dialer utilites. It is possible to use a macro utility such as QuicKeys2 in conjunction with a non-Apple Event-aware dialing utility. For instance, Snap is a control panel phone dialer which comes with In Touch by Advanced Software. It dials a number in the clipboard from within any application by pressing a user-defined hot key. Dialer is a shareware DA which uses a similar approach. Dialer can be obtained from online services or your local user groups.

New Document Shortcut Not Using ClarisWorks Option File (All)

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.

If you have set up ClarisWorks 2.0 options files, and you open new documents using the Shortcuts palette , you'll find ClarisWorks won't use your options file; it will simply create a new, standard document. Using the Shortcuts palette bypasses the "New Document" dialog box; this prevents the Options file from being applied.

There are two workarounds:

Open new documents from the "New" menu choice from the File menu.

Record a macro to open a new document. Be sure to select "With Shortcut" in the Record Macro dialog box. If you also choose "In Short Cuts Palette", you will be able to create a new document whether or not you have existing documents open. (The new document Shortcuts provided with ClarisWorks are only visible when there are no documents open).

Please see page 2-20 of the ClarisWorks 2.0 User's Guide for information on options files. See page for 8-50 of the ClarisWorks 2.0 User's Guide for information on Shortcuts and Macros.

This problem has been fixed in versions 2.1 - 4.0.

DOS 3.3: Commands ignored

The CTRL-D of a DOS command must be the first character on an output line and must immediately follow a carriage return. If it doesn't, the command is printed on the screen or to the printer, but is ignored by DOS.
This article has been archived and is no longer updated by Apple.
GET or PRINT statements that end with one of the following often cause this problem:

- ";" semi-colon
- "," comma
- tab
- space

A PRINT statement on the line above a DOS command generates the necessary carriage return; alternatively, define D$ as a carriage return and a CTRL-D:

```
10 D$ = chr$ (13) + chr$ (4)
```

DOS commands are also ignored when improperly used. IN# and PR# DOS commands, for example, must be sent out as:

```
10 print chr$(4);"IN#0"
20 print chr$(4);"PR#0"
```

For further explanation, refer to pages 100 through 103 of The DOS Manual or page 25 of The DOS Programmer's Manual.

EtherPort Installer Upgrade for System 6.0.4 & 6.0.5

This article contains information on an upgrade for Novell's EtherPort installers.

This article has been archived and is no longer updated by Apple.
Novell has updated their installers to work with System Software 6.0.4 and 6.0.5. You can obtain the updated installers from Novell, or install the drivers on a system running System Software 6.0.4 or 6.0.5 using this workaround:

To install Novell EtherPort drivers on systems running System Software 6.0.4 or 6.0.5:

1) Start up the system from a 6.0.4 or 6.0.5 System Tools disk.

2) Eject the Tools disk.

3) Insert the Novell Installer disk and execute the Installer from that disk.

Be prepared to swap the disks a few times when prompted by the Installer program. This procedure differs from the normal install procedure of starting up from the Installer disk.

To obtain the new Installer disk, contact Novell. Note that there are two different updated versions of the Installer program for the two different Novell EtherPort II cards distributed:

Version 2.5 Rev e This is for the "Intel" or long EtherPort II card.
Version 3.25 Rev b This is for the "National Semiconductor" or short EtherPort II card.

For more information, search under: "Novell"

Object(s) in the Layout Footer May Slide Up Into the Body Part and Print After Each Record (DB)

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
In the ClarisWorks 2.0 database environment, it is possible to insert a footer as a layout part , which allows you to have information print at the bottom of each printed page when printing from that layout. You can also remove blank space between objects when printing by choosing Layout menu, Layout Info.... and clicking the slide options.

However, if you have set your layout to slide objects, because you expect that there will be empty fields on the layout and you wish to maintain a professional appearance on your printout, you may find that fields or objects in the layout Footer will slide up into the body part and print after each record.

The workaround is to add a footer by choosing Format menu, Insert Footer... (available when in the Browse mode) to place any information that you want to print at the bottom of each page. Please note that a footer entered in this manner will appear on every layout in your database.

Pasting a Single Value into a Range in a ClarisWorks Spreadsheet (SS)

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
The ability to paste a single value and have it fill a range with a single step is not available in ClarisWorks. The easiest way to accomplish this task is to use the following steps:

1. Enter a value into a cell in your spreadsheet document.
2. Highlight the range of cells you want. Single click or drag-select down, then across.
3. Choose Fill Right, and then Fill Down from the Calculate menu (or press Command-R, then Command-D; Ctrl-R and Ctrl-D on Windows).

You could also automate the fill steps above in a Macro/Shortcut if you are using ClarisWorks 2.0 or higher.

This solution also works for ClarisImpact Tables. The only difference is that Fill Right and Fill Down are Available from the Table menu.

Some Keyboard Shortcuts Not Supported On Macintosh Plus (WP)

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
On other than a Macintosh Plus computer, text of a ClarisWorks Word Processing document/frame or a ClarisImpact Report document or Word Processing Model can be selected from the keyboard.

Option-Shift-Right Arrow will select the word to the right of the insertion point.

Option-Shift-Left Arrow will select the word to the left of the insertion point.

On a Macintosh Plus computer, the Left Arrow produces a "+", the Right Arrow an "*", the Up Arrow a "/" and the Down Arrow an "=".

Using a ClarisWorks Macro to Automatically Print Every Other Page (All)

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
If you want to print on every other page (so that you can print on both sides of each page), there is a way to do this using ClarisWorks. The manual method is to select Print in the File menu, click in the radio button "From ____ To: ____" and fill in the first page number in both blanks. Then repeat the procedure for the successive pages you want to print.

To automate this procedure, record a macro. The following example will print the odd numbered pages. When you begin recording, name the macro and give it a keystroke.

Then type:
Command-P (to bring up the Print dialog box)
Tab 1 (to place the number "1" in the From blank)
Tab 1 (to place the number "1" in the To blank)
Return (to activate the printing of page 1)

Command-P
Tab 3
Tab 3
Return (to activate the printing of page 3)

Continue the steps for 5, 7, 9 etc. Since printing pages that do not exist has no effect, go out to the farthest page number you might want to print in the future. Now record a Macro to print the even numbered pages. Simply run these two macros in the future.

If you have ClarisWorks 2.0, you can link these macros to your own customized palette button for one click use in the future.

"Could Not Configure Connection Tool" Error Message (CM)

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
If phone numbers in the Connection Settings dialog are entered with spaces, the ClarisWorks Communications environment will generate an error message which reads "Could Not Configure Communication Tool." This is especially confusing if you are using the Phone Book, because it is more natural to enter phone numbers with spaces and parentheses or to use an outside line extension such as "9" followed by a comma.

The Right Way: 9,408-727-9054 or 408-727-9054 or 9,4087279054

The Wrong Way: 9, (408) 727-9054 or 9,(408) 727-9054 or (408) 727-9054

You will also get this error message when dialing with the Dial menu in the status bar of ClarisWorks 2.0 if the Serial Tool is selected in Connection Settings, or if you change the Type field in the Address Book to something other than PhoneNumber.

Inadvertent Ability to Save Changes to a Locked Claris CAD 2.0 File on an AppleShare 3.0 Server

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.

Under AppleShare 3.0vX, if you lock a Claris CAD 2.0vX file residing on a server using the Get Info window from the Finder, you will still be able to save changes to the file even though it is locked. The locked file behaves correctly on individual machines, but not when saved to AppleShare servers.

A workaround would be to save the file as a stationery file.

Opening Files Created by Microsoft Word Versions Other Than 3, 4, 5, PC and WinWord (WP)

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
Page B-3 of the ClarisWorks 2.0 User's Guide shows a Microsoft Word translator in addition to the Microsoft Word 3, 4, 5, PC and WinWord translators. Some people might expect that this indicates that ClarisWorks will open versions of Microsoft Word other than 3, 4, 5, PC and WinWord.

To open files created by older versions of Microsoft Word, open the files in a newer version of Word and save the files in that version's format.

Alternatively you could open the files in a text processor such as Vantage, or open the file in MacWrite Pro (hold down the Option key while choosing Open in the File menu), although you will lose some formatting and there will extraneous characters that will need to be stripped out.

ClarisWorks Page Break Before a Sub-summary (DB)

ClarisWorks cannot designate that a part on a database layout should always advance to a new page before printing - but there is a workaround.

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.

Q. I want my ClarisWorks database to print with a page break before each sub-summary. How can I get it to do this?

A. ClarisWorks cannot designate that a part of a database layout should always advance to a new page before printing. However, you can achieve something similar to this. Let's say you are a teacher with several classes. You have a database of students for all your classes and want to print a report that prints the class and a list of students in that class (a sub-summary when sorted by class). You want each class to start on a new page. To do this, try these steps

1. Create a layout with a Body part and a Sub-summary part (when sorted by Class) above the body.
2. Position the Class field in the sub-summary, and the Student field in the body.
3. Shrink the body to the minimum vertical height that still can contain the student field.
4. Enlarge the sub-summary so that it pushes the body all the way to the bottom of the layout.
5. Sort the file by Class.
6. Print the report. Each class group will start on a new page.

TIP: On the Macintosh, if you are printing to an Apple LaserWriter, be sure to select the Larger Print Area check box in the Options of Page Setup, otherwise you'll get only one student per page.

Another option to creating a separate sub-summary category on each page is to do a find for one of the items to be summarized and then generate the Sub-Summary report. Repeat doing a find for the second item to be summarized, etc. This will give the same results although it requires more effort to do. If the same report is to be used, then Macros could be used to automate part of the procedure.

ClarisWorks 2.0 and 2.1 for Macintosh: Technical Specifications

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
Technical Specifications of ClarisWorks 2.0 and 2.1 for Macintosh

All Documents (except Communications)
Max. Number of Open Documents - Limited by available memory
Max. Number of Open Views per Document - Limited by available memory
Max. Number of Objects per Document - 65,534
Max. Object Size - 32,767 x 32,767 points
Min. and Max. Object Scaling - 25% to 400% both horizontally and vertically
Min. and Max. Header and Footer Size - One third of the chosen paper size
Min. and Max. Margin Settings - Specific to the chosen printer
Min. and Max. Printer Reduction - Specific to the chosen printer
Min. and Max. for Starting Page Number - 0 to 9000
Number of Split Bars - 2 Horizontal and 2 Vertical (9 panes)
Min. and Max. View Scale - 3.125% to 3200%
Max. Number of Slides (pages) - Limited by document size**
Max. Slide Background Colors - 8, 16, or 81 fixed colors/256 editable colors**
Max. Slide Border Colors - 8, 16, or 81 fixed colors/256 editable colors**
Rulers Types - 2 (Text and Graphics)
Rulers Units - 5 (Inches, Picas, Points, Millimeters and Centimeters)

Number of Divisions per Ruler Unit - 1 to 512
Number of Formats - 5 (General, Currency, Percent, Scientific and Fixed)
Number Precision - 0 to 15 places
Date Formats - 5
Time Formats - 4
Default Shortcuts Buttons - 10 (Cut, Copy, Paste, Undo, Bold, Italic, Underline, Open, Save and Print)**
Other Shortcut Buttons - 19 (Align Center, Align Justify (not SS), Align Left, Align Right, Clear, Edit Macros, Edit Shortcuts, Hide/Show Margins, Hide/Show Page Guides, Insert Document, Plain Text, Play Macro, Record Macro On/Off, Slide Show, Spell Check, Stack Windows, Strike-Thru, Thesaurus and Tile Windows)**
Max. Number of Macros - 65,535
Dictionary - 110,000 words
Thesaurus - 660,000 synonyms
User Dictionary - 32,767 character capacity
Graphics Formats - 6 XTND Filters (EPSF, GIF, MacPaint 2.0, PICT, QuickTime Movie and TIFF)**

Word Processing Documents
Max. Number of Pages Across - 9
Max. Number of Pages Down - (65,534 / Number of Column per page) / Number of Pages Across
Max. Number of Columns - 9
Min. Space Between Columns - .06 inches

Max. Number of Footnotes - 65,534
Min. and Max. for Starting Footnote Number - 0 to 9999

Word Processing Environment
Outline Formats - 7 (Diamond, Numeric, Harvard, Legal, Bulleted List, Check List and one custom format per text frame)**
Outline Topic Labels - 12 (None, Diamond, Bullet, Check Box, Harvard, Leader, Legal, Letter Caps, Letter, Numeric, Roman Caps and Roman)**
Max. Number of Customizable Outline Levels - 16 **
Max. Number of Outline Levels - 256 **
Min. and Max. Space Before Paragraph - 0 pt. to 255 pt. **
Min. and Max. Line Spacing - 4 pt. to 512 pt. **
Min. and Max. Space After Paragraph - 0 pt. to 255 pt. **
Number of Text Styles - 11 (Plain, Bold, Italic, Underline, Strike Thru, Outline, Shadow, Condense, Extend, Superscript, Subscript)**
Max. Number of Defined Styles - 20 (the first eight get key equivalents) **
Min. and Max. Font Size - 4 pt. to 255 pt. **
Number of text Colors - 8, 16 or 81 fixed colors / 256 editable colors **
Max. Number of Style Changes in a (Set of Linked) Text Frame(s) - 65,534

Types of Text Wrapping Around Objects - None, Regular and Irregular **
Number of Alignment Options - 4 (Left, Center, Right and Full Justification)
Number of Tab Marker Types - 4 (Left, Center, Right and Decimal)
Tab Fill Types - 4 (None, -, _ and .) **
Max. Number of Tab Settings per Paragraph - 20
Default Word Processing Shortcuts Buttons - 10 (Hide/Show Invisibles, Custom Style, Increment Font Size, Decrement Font Size, Make Table, Copy Ruler, Apply Ruler, Align Left, Align Center and Align Right) **
Formats Supported - 25 XTND Translators (Acta 3.0, AppleWorks 2.0-3.0, AppleWorks GS, EPSF, GIF, MacPaint 2.0, MacWrite, MacWrite II, MS-Word 3.0-4.0, MS-Word PC, MS-Works 1.1-2.0, MS-Write, PICT, RTF, Text, TIFF, WordPerfect 1.0-1.02, WordPerfect 4.2-5.0 PC, WriteNow 1.0-2.2 and WriteNow NeXT) **

Draw Documents
Max. Number of Pages - 9999 across by 9999 down but less than 32,767 total

Draw Environment
Number of Tools - 10 (Line, Rectangle, Rounded Rectangle, Oval, Arc, Polygon, Freehand, Bezigon, Regular Polygon and Eyedropper)**

Min. and Max. Number of Sides for a Regular Polygon - 3 to 40 **
Max. Number of Points per Polygon or Freehand Object - 8,192
Number of Editable Gradients - 32 editable gradients**
Number of Fill/Line Colors - 8, 16 or 81 fixed colors / 256 editable colors **
Number of Fill/Line Patterns - 64 editable patterns **
Min. and Max. Line Width - .03 pt. to 255 pt.
Number of Arrow Line Types - 3 (Start, End and Both Ends)
Default Drawing Shortcuts Buttons - 10 (Align Top, Align Left, Align Bottom, Align Right, Align Horizontal Centers, Align Vertical Centers, Irregular Text Wrap, Move Forward, Move Backward and Rotate 90 Degrees) **
Other Drawing Shortcuts Buttons - 17 (Autogrid On/Off, Decrement Line Width, Distribute Horizontally, Distribute Vertically, Duplicate, Flip Horizontal, Flip Vertical, Increment Line Width, Move to Back, Move to Front, No Text Wrap, Regular Text Wrap, Reshape, Smooth, Group, Ungroup, Unsmooth) **

Paint Environment (subsumes the Draw Environment) **
Min. Number of Pixels - 36 across and 36 down

Max. Number of Pixels - 2000 across and 2000 down
Color Depth Levels - 6 (B&W, 4, 16, 256, Thousands and Millions)
Resolution Levels - 5 (72, 144, 288, 300 and 360 DPI)
Paint Modes - 3 (Opaque, Transparent pattern, Tint)
Grid Sizes - 5 (2, 4, 8, 16 or 32 pixels)
Number of Tools - 18 (Line, Rectangle, Rounded Rectangle, Oval, Arc, Polygon, Freehand, Bezigon, Regular Polygon, Eyedropper, Selection Marquee, Lasso, Magic Wand, Paint Brush, Pencil, Paint Bucket, Spray Can and Eraser)
Number of Editable Brush Shapes - 32
Number of Fill/Line Colors - B&W, 4 or 16 / 256 editable colors
Min. and Max. Spray Can Dot Size - 1 to 72 pixels
Min. and Max. Spray Can Flow Rate - 1 to 100 (units?)
Default Painting Shortcuts Buttons - 10 (Opaque Mode, Transparent Mode, Tint Mode, Lighter, Darker, Tint, Fill, Blend, Rotate 90 Degrees and Zoom to Fit)
Other Painting Shortcuts Buttons - 9 (Autogrid On/Off, Decrement Line Width, Duplicate, Flip Horizontal, Flip Vertical, Increment Line Width, Invert and Pickup)

Spreadsheet Documents

Max. Number of Cells - 256 Columns by 16,384 Rows = 4,194,304 cells
Min. and Max. Column Width - 0 to 510 pts.
Min. and Max. Row Height - 0 to 256 pts.
Number of Page Breaks per Document - 65,535
Max. Lock Titles Area - 128 Columns by 128 Rows **
Max. Number of Characters in a cell - 255
Cell Alignment - 5 (General, Left, Center, Right and Wrap) **
Cell Border Types - 5 (Outline, Left, Top, Right and Bottom) **
Number of Functions Available - 100
Default Spreadsheet Shortcuts Buttons - 20 (AutoSum, Align Center, Align Left, Align Right, Align Wrap, Borders Outline, Borders Right, Borders Bottom, Area Chart, Bar Chart, Line Chart, Pie Chart, Commas, Currency, Delete Cells, Insert Cells, Show-Hide Formulas, Percent, Sort Down and Sort Up) **
Other Spreadsheet Shortcuts Buttons - 25 (Align General, Auto Calc On/Off, Auto Size Column, Auto Size Row, Calculate Now, Copy Format, Decrement Decimal, Increment Decimal, Gridlines On/Off, Hi-Lo Chart, Next Date, Next Time, Negative Parenthesis, Paste Format, Pictogram Chart, Scatter Chart, Scientific Notation, Set Print All, Set Print Selected, Solid Gridlines, Stacked Area Chart, Stacked Bar Chart, Stacked

Pictogram Chart, XY Line Chart and XY Scatter Chart) **

File Formats Supported - 7 XTND Translators (ASCII Text, DBF, DIF, SYLK, AppleWorks SS, MS-Works 2.0 SS and MS-Excel 3.0) **
Maximum number of cells in a sort 65520

Charts
Chart Types - 12 (Pie, Bar, Stacked Bar, Area, Stacked Area, Line, X-Y Line, Scatter, X-Y Scatter, Hi-Low Pictogram and Stacked Pictogram) **
Max. Length of Chart Title, Legend and X-Y Axis Labels - 255 **
Positions for Legend/Title - 8 (Upper Left, Upper Middle, Upper Right, Middle Left, Middle Right, Lower Left, Lower Middle and Lower Right) **
Types of Axis Ticks - 4 (None, Outside, Inside and Across) **
Number of Chart Symbols - 12 **
Chart Symbols Colors - 8, 16 or 81 fixed colors / 256 editable colors **
Chart Symbol Size - 4 to 250 points **
Positions for Label Data - 9 (Upper Left, Upper Middle, Upper Right, Middle Left, Center, Middle Right, Lower Left, Lower Middle and Lower Right) **

Database Documents
Max. Number of Records per Document - 32,767
Max. Number of Fields per Document - 255
Min. and Max. Number of Chars. in a Field Name - 1 to 63

Field Types - 6 (Text, Number, Date, Time Calculation and Summary)
Max. Number of Chars. in a Text or Number Field - 510 chars. less 20 for each style change in the field
Max. Number of Chars. in Calculation or Summary Field Formula - 254
Number of Available Functions - 89
Max. Number of Layouts in a File - 32,767
Min. and Max. Number of Chars. in a Layout Name - 1 to 31
Layouts Types - 5 (Standard, Columnar, Labels, Blank and Duplicate)
Max. Length and Width of Layout - 1 page (will use objects placed below)
Number of Layout Parts - 5 (Header/Footer, Body, Sub-Summary and Leading/Trailing Grand Summary)
Max. Number of Columns in a Layout - 12
Max. ClarisWorks Labels - up to 110 label models can be defined in the file**
Max. Number of Find Requests - 32,767
Max. Length of a Match Records Formula - 255 characters
Default Database Shortcuts Buttons - 10 (Select Equivalents, Select Non-Equivalents, Select Less Than, Select Greater Than, Sort Up, Sort Down, Resort, New Record, Omit Record and Show All) **
Other Database Shortcuts Buttons - 5 (Delete Record, Hide Selected, Select Less Than or Equal, Select Greater Than or Equal and Resort) **

File Formats Supported - 6 XTND Translators (ASCII Text, DBF, DIF, SYLK, AppleWorks DB and MS-Works 2.0 DB) **
Max. Number of characters in a field imported from DIF, DBF, and ASCII Text (Tab-Seperated-Text)File - 255 characters.

Communications Documents
Max. Number of Open Documents - Limited by available memory **
Max. Memory of Log Window - 32,767 lines, kilobytes or screens (?) **
Number of Included Tools - 6 (Apple Modem, Serial, Text, XMODEM, Kermit, TTY and VT102) **
Max Entries in PhoneBook - 32,767 **
Default Communications Shortcuts Buttons - 10 (Print, Save, Copy, Paste, PhoneBook, Open Connection, Wait Connection, Reset Connection, Send File and Receive File) **
Other Communications Shortcuts Buttons - 8 (Close Connection, Edit Macros, Edit Shortcuts, Macro Wait, Play Macro, Record Macro On/Off, Stack Windows and Tile Windows) **

Printing Shadow Style to Non-PostScript Printers

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
If you modify text with the "Shadow" style, you may not get the expected results when you print to a non-PostScript (True Type) printer. Although the text looks OK on the screen, the Shadow effect may be very minimal when printed.

The issue involves the print driver translation of a 72 dpi screen image to 360 dpi printed output. On the screen, shadowed text is offset by one pixel, or 1/72 of an inch. The StyleWriter print driver also offsets shadowed text by one pixel, but one pixel is only 1/360 of an inch. If you look closely enough at the output you can discern the difference.

This affects all non-PostScript (QuickDraw) devices. Shadowed text on ImageWriter II printers at 72 dpi appear fine. With LaserWriter LS printers at 300 dpi, the effect is a little more pronounced. With StyleWriter printers at 360 dpi, it is most pronounced.

Apple is aware of this issue.

The issue occurs with bitmapped and TrueType fonts, but Adobe Type Manager (ATM) allows you to print true drop shadow styled text on QuickDraw based printers, especially the higher resolution ones. When you install ATM, install the fonts that come with it. Because TrueType fonts take precedence over others when printing, the TrueType fonts in your System will need to be removed for this solution to be effective.

System 7 Tune-up and ClarisWorks Installation (All)

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
On page 2 of the ClarisWorks 2.0 Installation Guide, one of the requirements listed is that the System 7 Tune-Up (version 1.1.1) needs to be installed. This is based on Apple's recommendation for proper system operation. The Tune-Up addresses many system software level issues relating to memory, file storage, speed, and printing. It should be noted that this is true of ANY Macintosh application, not just ClarisWorks.

Please refer to TIL article# 10150: "**System 7 Tune-Up 1.1.1: Availability, Installation**" for more information on the Tune-Up.

Users may also upgrade to later versions of system software, please refer to TIL article# 30152: "**Mac OS: Upgrading from Older OS Versions**" for more information on upgrading system software.

While ClarisWorks (or any other Macintosh application) will run without the Tune-Up installed, users may experience unexpected software anomalies that would otherwise be eliminated by the Tune-Up. This requirement was included in the Installation Guide to prevent this.

To find out if the Tune-Up has been installed, switch to the Finder and under the Apple menu select "About This Macintosh...". If the Tune-Up has been installed there will be a bullet to the right of the System version, i.e. 7.01·.

A special note for Macintosh Performa users: System 7.01p includes the Tune-Up as part of the system software and does not require a call to Apple. This version will only be found on Macintosh Performa 200 and 400 models. All other Macintosh Performa computers are shipping with System 7.1p or later and do not require the Tune-Up.

Wrapping the Text in a Text Frame or Text Model Around a Picture (All)

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.

To wrap text in the body of a ClarisWorks Word Processing document around an object, simply select the picture with the Arrow tool and choose Text Wrap... from the Options menu.

ClarisImpact automatically wraps around any object or Model drawn in the Report environment.

If the text is in a ClarisWorks Text Frame or ClarisImpact Text Model and you wish to wrap it around an object or picture, add the steps below:

1. Select the Text Frame or Text Model with the Arrow tool.
2. From the ClarisWorks Options menu, choose Frame Links; or from the ClarisImpact Text menu, choose Frame Links.

Similarly, to make the Text Wrap feature work in a ClarisWorks Drawing document or a ClarisImpact Drawing or Presentation document, the Frame Links command must be enabled for the underlying text object. This is true even if you won't be linking this text object to any other Frames or Models. To do this:

1- Select the text object(s) behind the graphic to be wrapped
2- From the ClarisWorks Options menu, choose Frame Links; or from the ClarisImpact Text menu, choose Frame Links.

NOTE: This solution will also work with a ClarisImpact Outline Model. After following the steps above simply use the To Outline feature from the Text menu.

KanjiTalk: Running U.S. Applications

Can any Macintosh operating system version be mixed with any application on a Kanji Macintosh? For example, while running U.S. System 6.0.x with Kanji fonts, could I run the English versions of MacWrite II and PageMaker and print in Kanji on a Kanji LaserWriter?
This article has been archived and is no longer updated by Apple.
Sometimes, you can successfully run a U.S. application with KanjiTalk and have a Kanji script appear in the data space and print in a Kanji script to a LaserWriter IINTX-J. However, if it hasn't been localized properly, you may encounter many more issues, possibly serious, compared to mixing and matching applications and operating systems localized for other countries. Most English applications don't support the 2-byte character set. Exceptions exist with applications like Excel or WordPerfect.

A U.S. application that uses the Script Manager, which makes it possible to support non-Roman scripts: Arabic, Hebrew, Japanese, and Chinese, may be functional (with minor incompatibilities) or usable (with somewhat minor inconveniences). Some likely incompatibilities include text-positioning issues requiring you to press the backspace key twice, incorrect date and time formats, different numerical and character delimiters, and so on. (Remember: Kanji uses a 2-byte-wide word.) With other less-compatible applications, serious system faults may occur at any time, including when changing font parameters or printing a PostScript font.

Generally, you may have fewer issues using graphic-oriented packages than text-oriented packages. Also, you can use any operating system on any Macintosh, keyboard differences aside.

Although you can usually use a non-U.S. (or other) word processor with the U.S. Macintosh OS, or vice-versa, we do not recommend using non-Kanji applications with the Kanji OS, or vice-versa.

Printing ClarisWorks 1.0 and 2.0 Communications Documents (CM)

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.

"You can't print a communications document. Select the data you want to print, copy it, paste it into a word processing document, and print it from there."

The above text appears in the ClarisWorks 1.0 Communications Handbook, page 2-24, or the ClarisWorks Handbook Performa, page 2-24.

This isn't the case with ClarisWorks 2.0.

In ClarisWorks 2.0, you can print a communications document (both the data in the terminal area and the scrollback) during a communications session or after the session. You print a communications document as you do any other ClarisWorks document.

Pasting Finder Icons

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
The Macintosh Finder in System 7 allows you to copy the icon which is attached to any file by opening the Get Info screen for the file, clicking on the icon and choosing Copy from the Edit menu. You can then paste the icon into any Claris application.

The information that is copied, however, is a little bit more than the simple icon picture. Every Macintosh icon has a "mask" attached, which gives the icon its distinctive highlighted appearance whenever the icon is selected.

All Claris graphics applications treat the pasted icon as a grouped pair of icons. However, they treat the mask differently. MacDraw II and MacDraw Pro both show the mask as an object which is entirely black. MacDraw II also loses any icon color.

ClarisWorks 1.0, ClarisWorks 2.0 and ClarisImpact all display the mask as a white transparent object after ungrouping.

Files Installed by ClarisWorks 1.0v1 for Windows

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
This is a list of the Dynamic Link Library (.DLL) files, executable (.EXE), and other related files installed by ClarisWorks 1.0v1 for Windows.

Directory:

C:\\WINDOWS

CLARIS.INI - Contains information about location of the program and installed options

NOTE:

ClarisWorks does not modify the WIN.INI or SYSTEM.INI during the installation process. All relevant information is stored in CLARIS.INI. If you already have another Claris product installed (like FileMaker), there will be a CLARIS.INI. When you install ClarisWorks, it will update the existing CLARIS.INI.

C:\\WINDOWS\\CLARIS

USENG.NDX - The main dictionary (used by the ClarisWorks spell checker)
USERD.SPL - User Dictionary (custom dictionary you can add terms to)
UTHES.MTH - US English Thesaurus

Files with an extension of XTD. These are translator files, and allow you to open documents created in other applications. The translator files allow you to import and export your data between ClarisWorks and other software applications. ClarisWorks installs 21 XTD translator files into the Claris directory. Please refer to Chapter 2, page 8 for more information about importing files created by other applications into ClarisWorks. Chapter 2, page 21 contains information about exporting your work from ClarisWorks into other applications.

C:\\CLWORKS

CLWORKS.EXE - ClarisWorks application program file
CLWORKS.HLP - ClarisWorks Help
README.CWK - README file with any last minute tips/corrections to printed manual

Also make sure the following files are in the CLWORKS directory:

CWKBDHK.DLL
DLGFONT.FON
CLWORKS.RSR
FONT.MAP

C:\\CLWORKS\\SAMPLES

14 files with a .CWK extension. These are sample ClarisWorks documents you can open from ClarisWorks.

C:\\CLWORKS\\TUTORIAL
PEGALOGO.WMF - Windows Metafile (graphic image)
EMPLOYMO.RTF - Rich Text Format (RTF) document
PEGASART.WMF - Windows Metafile (graphic image)
QRTYLYPRT.CWK - ClarisWorks document
LTRHDART.WMF - Windows Metafile (graphic image)
PEGLTRHD.WMF - Windows Metafile (graphic image)
SMPLOBJS.CWK - ClarisWorks document
SALESPRF.CWK - ClarisWorks document
NEWSLTTR.CWK - ClarisWorks document

Increasing the Size of a ClarisWorks Layout

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
The ways to accommodate more fields on a page, or to make the layout larger is to do one or more of the following:

1) Make the size of the font for your fields smaller.

2) Increase the size of the page in the Page Setup dialog.

3) In the Page Setup dialog, change the Reduce/Enlarge option to a lesser percentage (like 50%). (This option is usually the easiest and most preferable.)

4) Change the margins in the Document dialog (choose Document under the Format Menu) to a lesser number.

Remember-

1) ClarisWorks still has a limit of 255 fields for a database document.

2) Changing items in the Page Setup dialog will change how all your layouts print out until these options are reset.

3) In order for fields to be visible, they must be contained in a part. You may need to drag the body down to the bottom of the layout to see all the fields.

Keyboard Shortcut Error in French ClarisWorks

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
The keyboard shortcut for defining a new record in the database module in ClarisWorks for Windows is shift+control+N.

In the French getting started manual (page 6-7), however, the shortcut is noted as shift+N (Maj+N), and it should be (Maj+Cntrl+N).

A New Perspective on Charts

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.

Q. The tops of the bars in my 3D bar chart do not exactly correspond with the number on my axis. The tops of my bars are consistently about 20% below the correct position on the axis.

A. This is due to the perspective of the 3D chart. By default, the width of the bar (both depth and width) is only 60% of the base volume for that bar. Because of this, there is some real space between the bar and the axis. Since these charts are rendered in true 3D space, there is some perspective error caused by the space between the bar and the axis.

There are several solutions to this symptom.

The easiest and most effective workaround is to set the Series Width value from the "Chart Info..." dialog under the Edit menu to 100. This will make the the bars volume fill 100% of the base. This makes the space between the bar and the axis 0 so there will be no error in perspective.

You can also use the "3D Option..." dialog under the Chart menu to change the vertical perspective to 0 (or close to it). This will have the affect of viewing the chart head-on so the perspective error will be reduced.

Using Outline View as a Writing Tool

The outliner is great for brainstorming and organizing your work. You can also use it to simulate style sheets and drag-and-drop operations.

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.

Among the outline formats you can choose in ClarisWorks 2.0 and ClarisImpact 1.0 is custom formatting, where you define how each level will be indented and what font, size and style the text will be. This is an extremely powerful feature. It allows you to specify standard styles to use at different levels of your document.

With each new section or sub-topic, there is no need to manually indent paragraphs and apply formats. Instead, you just create a new topic at the level you want. The custom outline format takes care of the rest.

And if you decide to change the way a certain level looks, modifying the level format changes every topic of that level to the new format automatically. While you can do the same thing with the Define Styles feature in Claris Works, the custom formatting feature in the Outline menu adds the additional capability to control paragraph indents.

Outline View vs. Page View

Most often, you use Outline View as a notepad to organize your ideas. Once organized, you leave Outline View to format and fill out their document. However, there is another approach which is potentially more efficient, especially for longer, structured documents such as research papers and business reports.

For example, imagine this document was in outline view. It's possible if you set Topic labels (Labels in ClarisImpact) to None and indents (Left Indent in ClarisImpact) to zero.

This brings up an interesting point. For documents that use topic and sub-topic headings with varied paragraph formats, it may make the most sense to start in Outline View and stay there. An added benefit of composing your document in this way is that you can quickly move paragraphs and sections around since you can grab a whole topic.

For instance, say you decided this sentence should come before the one above. Rather than cutting and pasting, you can just click in the left margin on the first line in the paragraph and drag the cursor up until you see a black bar appear before the paragraph above. Let go of the mouse button and the paragraph will be repositioned.

Collapsing Topics

You can even collapse topics to get an overview. This paragraph could be considered a sub-topic of the topic "Collapsing Topics." If you were viewing this in the ClarisWorks or ClarisImpact outliner, you could double-click the heading to collapse all the paragraphs under it. What a time-saver in long documents! You could use the Expand To command and specify level 1, 2 or whatever, depending on how much detail you want to see.

Creating New Topics in Claris Works

Unlike ClarisImpact, Claris Works does not have preset topics or levels in the outliner; however, creating new topics is easy. To create a new topic on the same level in Claris Works, just press return. For a new sub-topic, press Command-R or choose New Topic Right from the menu. For a new section, press Command-L or choose New Topic Left.

If you've already created a topic but want to change its level, choose Move Left or Move Right from the menu. In addition to the command key equivalents listed in the menu, you can use Control-right arrow or left arrow to move right or left.

[A template demonstrating these techniques in Claris Works is available for download from Claris forums on America Online and CompuServe, and the Claris BBS.]

Figure 1 - Custom outline formats simulate elements of the article's text: Headlines, subheadings, and body text.

Gray Line other than Margins Showing when Page View is On (PT)

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
You may notice a second gray line or double margin in a ClarisWorks 2.0 Paint document under some of the following conditions:

- Page View is toggled on
- Page Setup size is larger than the document size
- Margins have been reduced
- Pixels across or down have been increased

The extra line represents the Document size you have set. In order to change the document size to match Page Setup choose Document from the Format menu (change pixels across and/or pixels down).

NOTE: The document size may have been chosen by ClarisWorks based on the available memory. Close documents to free more of the available memory or allocate more memory to ClarisWorks.

If you have enough memory allocated to ClarisWorks then the default settings for a new Paint document (1 inch margins all around, Pixels across = 468 and Pixels down = 648) will make your Document size and your Page Setup size match exactly. If you need to change Page Setup to Landscape Orientation then switch the Pixels across and Pixels down. If you set your margins to 0.5 inches all the way around then your document size will need to be set to 540 Pixels across and 720 Pixels down.

How to Convert Fractional Values to Decimals (SS)

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
Sometimes you have to work with numeric values that are expressed as fractions. For example, 2 3/4 to mean 2.75. ClarisWorks can't sort or do arithmetic when values are expressed this way. To convert the fractions to decimal values, use the following calculation:

Given a ClarisWorks Spreadsheet cell A1 contains a fraction, the following formula will return a decimal equivalent:

=IF(FIND("/",A1,1)=0,A1,LEFT(A1,FIND(" ",A1,1)-1)+ (MID(A1,FIND(" ",A1,1)+1, FIND("/",A1,1)-FIND(" ",A1,1)-1)) / RIGHT(A1,LEN(A1)-FIND("/",A1,1)))

This formula works as long as a space separates the whole part of the number and the fractional part, and a slash (/) is used to express the fraction.

This formula will also work for a ClarisImpact Table.

How to Import Files that Contain Returns within Fields

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
ClarisWorks lets you enter more than one line of information into database text fields. This handy feature isn't supported by many database programs, so ClarisWorks has to make special accommodations for this feature when you export information. It departs from the standard tab-delimited text format; any returns pressed within text fields are converted to a special character, ASCII 11 (this is also the character FileMaker Pro uses.) This feature applies for exports only. When inserting or opening a text file in the ClarisWorks 2.0 database, the ASCII 11 is converted to a space, not a return.

If you want to preserve the returns within your database text fields, you need to follow a different procedure than usual. One method you can use is to change the returns within fields to some special series of characters before you save the file as text. Later, when you insert the file, you can change the special characters back to a return.

Here is a step-by-step description of what you need to do:

1. Pick your own special character, or series of characters. You should use text that you don't use in your database, such as the bullet (·) or paragraph symbol (¶). In this example, we'll use "#@#".

2. Change the returns in your database file to your special character.

a. Choose Find/Change from the Edit menu. You may be accustomed to using this command with word processing tasks, but it also work with the database environment.

b. Type \\p into the Find field. This tells ClarisWorks to search for carriage returns.

c. Type #@# into the Change field.

d. Click Change All and confirm that you know this command cannot be undone. ClarisWorks will change all return characters to #@#.

3. Save the file as text. (Or, use the DIF format, if you want to preserve field names.)
When you insert or import the file, you use the Find/Change command again to restore the returns within fields:

1. Choose Find/Change from the Edit menu.

2. Type #@# into the Find field.

3. Type \\p into the Change field.

FAXstf and ClarisWorks

When using FAXstf with ClarisWorks and ClarisImpact, there are several anomalies.
This article has been archived and is no longer updated by Apple.
When using FAXstf with ClarisWorks and ClarisImpact

- Fax will not be selected when the Option key is held down.
- ClarisWorks and ClarisImpact will not allow addressing or scheduling of the fax.

Selecting Fax will not occur because these Claris programs uses the same Option key to print without a dialog screen that the fax software uses as its default to select faxing within an application.

The solution is to change the activation sequence to something else, such as Command-Option. Follow these steps:

1. Open FAXstf.
2. Select "settings" from the Apple menu.
3. Open the fax menu settings.
4. Change the activation sequence to one that will allow you to fax from ClarisWorks.

The above information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Knowledge Base. For software updates to ClarisWorks refer to the Apple Software Updates Web site at http://www.apple.com/swupdates.

Note: AppleWorks is the new name for ClarisWorks.

Lines Created with Tab Fill Leaders May Not End at the Same Point if Text Precedes the Tab (WP)

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
Lines created with Tab Leaders may not end at exactly the same point if text precedes the tab. Try this example:

1. Create a new word processing document
2. Insert a Left Tab on the Ruler at 4 inches
3. Double-click on this tab and the Tab dialog box should appear
4. Choose the solid line as the Fill type and click OK
5. Type "Hello", press Tab & press Return
6. Type "Goodbye", press Tab & press Return

Notice that the two lines do not end at the same point. Even with fractional character widths turned on, they do not match on screen or on printout. Development is aware of this symptom.

In the meantime, choosing a mono-spaced font, such as Courier, or turning on Fractional Character Widths may alleviate this.

Problems Printing from ClarisWorks to Brother HJ 400 (WP)

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.

It has been reported that you can have difficulties printing to a Brother HJ 400 dot matrix printer from the word processing environment in ClarisWorks. This is not a supported printer.

This might be solved by turning on Fractional Character Widths in Preferences.

Published Date: Feb 18, 2012

Unable to Print ClarisWorks 2.0 Database to GCC WriteImpact (DB)

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.

ClarisWorks 2.0 Database documents and the GCC WriteImpact printer do not work together (typically an error of ID = 04). This has been verified with GCC technical support. This occurs with the newest printer driver (version 2.1.1 or earlier). Other environments such as Word Processing print fine to the WriteImpact. ClarisWorks 1.0 Database documents print fine to the WriteImpact.

"Color QuickDraw is Required to Open this Document" Alert

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.

Symptom:
When opening a file, an alert appears that says "Color QuickDraw is Required to Open this Document".

Explanation: The document you're attempting to open is either a Paint document, or has a paint frame in it. This document was created on a color-capable Macintosh that supports full color. However, the computer you're using to open the document does not support full color (Macintosh Plus, SE, Classic).

These Macintosh models do not support opening documents that have full color paint objects in them. (They can, however, open ClarisWorks documents that have color objects or color text.) There is no workaround, other than reopening the document on a color-capable Macintosh, deleting the color paint object, then resaving the document.

How to Handle a Crashed Program in Windows NT

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
An application designed for Windows 3.0/3.1 such as FileMaker Pro 2.0, 2.1 or ClarisWorks 1.0 for Windows run in Windows NT in what is called WOW (Windows on Windows) emulation. When running FileMaker Pro or ClarisWorks in this emulation mode any other 16-bit application also running is dependent on this emulation session. If one 16-bit application crashes or locks up, all other 16-bit applications running in the WOW will also lock and cannot be accessed until you close the application that crashed.

To close a crashed application in Windows NT:
1. Press the Ctrl key, Alt key, and Del key on your keyboard all at the same time.
2. Choose Task List, select the application that has stopped responding and click "End Task". This will free all other 16-bit applications running.

Note: Any 16-bit application running in Windows NT will be in a single WOW emulation.

Graphics Preview in the Insert Dialog Box (All)

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.

Q) Why do some graphic files not Preview in the Insert... dialog box?

A) Page 2-11 of the ClarisWorks 2.0 Macintosh Getting Started Manual indicates that you can preview graphic files before using the Insert... command to insert them into your document. When you look at page 3-38 of the User's Guide, you can even see a preview of the Pegasus Logo (MacPaint) provided with the ClarisWorks Tutorial files. Unfortunately, this picture in the manual is misleading, and cannot be reproduced on your screen.

In reality, the Preview showing in the dialog box is based upon QuickTime's ability to preview the image. The preview checkbox and Create button in the Open and Insert dialog only show up if you have the QuickTime extension installed. Only PICT graphics and QuickTime movies can be previewed (the poster or preview frame of a QuickTime movie is a PICT graphic).

FileMaker Pro, ClarisWorks Running Slowly in Windows NT

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
Windows NT is a 32 bit operating system. This does not mean that it can not run a 16 bit application such as FileMaker Pro or ClarisWorks, Windows NT will run them in an emulation mode called Windows on Windows or WOW.

A WOW session is only started when the first 16 bit application is launched in Windows NT, and because of this the first 16 bit application that launches takes longer to start up. You can decrease the amount of time it takes for the first 16-bit application to launch by creating an icon for WOWEXEC.EXE and putting it in the STARTUP group.

ATI Graphics Ultra+/Pro Mach32 Video Driver Information

How to troubleshoot possible conflicts with ATI's mach32 video drivers.

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.
The following information was provided by ATI Technical Support to help troubleshoot possible video driver conflicts with Windows products.

Memory Problems

ATI technical support recommends excluding the range A000-C7FF from your memory manager. If you are using DOS's memory manager, the emm386 line in the config.sys would read as follows:

C:\\DOS\\EMM386.EXE NOEMS X=A000-C7FF

Also, edit the SYSTEM.INI file and include the following line in the [386Enh] section:

EMMExclude=A000-C7FF

Current Drivers

As of September 1993, the latest mach32 (pronounced "mock 32") video driver for the ATI Graphics Ultra+ and ATI Graphics Ultra Pro boards is version 2.1. The FlexDesk control panel will tell you what resolution you are running, how many colors you can show, and what version of the driver you have. To update the video driver, download the following files from ATI's BBS: LOADER.ZIP and M32WXX.ZIP, where XX is the current version of the driver. The updater will ask you if you want to uninstall the existing drivers; you should answer yes.

The files are available from Library #17 of the ATI forum on CompuServe or by calling the ATI Download Bulletin Board.

For troubleshooting purposes, you can use Microsoft's VGA (640x480) or 8514/a (1024x768) drivers instead of ATI's drivers.

ATIKEY.EXE is a utility that ships with the mach32 drivers and allows you to switch resolutions on the fly. This utility may be added to the load= line in the win.ini. If you suspect that ATIKEY might be causing problems, simply remove it from the load= line and then restart Windows.

Quick Time For Windows Problems

FileMaker Pro ships with the option to install Quick Time for Windows. To see if Quick Time is installed, Select About FileMaker Pro from the Help menu, then select Info.

To use Quick Time for Windows with the ATI mach32 video driver version 2.3 in Windows, set DeviceBitmap=OFF in the [mach] section of the WIN.INI file.

Troubleshooting Non Japanese Applications

Difficulties when using a US version of the application on the Kanji operating system

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.
If you are having symptoms that your application doesn't support 2 Byte Japanese characters, you are probably using a US version of application on Kanji Operating System. Fonts and inserting the cursor do not function properly.

· As the backspace key is pressed, the deleted Japanese character unexpectedly turns into another character. As more characters are deleted, the more garbled the end of the line becomes.

· The application accepts Japanese characters. However, the cursor appears to be away from the end of the text line. When placing a cursor within a line, characters are not inserted where the cursor is.

Find/Change and WorldScript

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
Certain WorldScript fonts will not display correctly in the Find/Change dialog window, they will show up as boxes.

The Find/Change dialog box uses regular Chicago (from the system) in its Find/Change dialog and certain WorldScript fonts do not have a corresponding characters, therefore they will not display correctly in the dialog window.

WorldScript and WorldScript fonts do not take into account dialog windows that access the system on which the program running.

This however does not prevent Find/Change from working correctly. The characters that are either typed or pasted into the Find and Change fields may not appear correctly, but they will work and will make the correct finds and changes in the document.

This would not be a problem for a version of MacWrite Pro working in a native environment. For example a Russian system with a Russian font would work fine.
Published Date: Feb 18, 2012

MacPlot not Compatible with AV machines

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
The MacPlot 1.2 driver that we currently ship under special request is not 32-bit clean. This means that it does not work properly under the memory management scheme known as 32-bit addressing. The DSP (Digital Signal Processor) chips in the new AV computers (660av and 840av) require 32-bit addressing, as well as all Power Macintosh computers, so this option can not be turned off as it could be in older machines.

The Claris version of the MacPlot driver, therefore, will not work on these computers. If you wish to plot from one of these machines, you will need to contact Microspot to obtain an upgrade to a 32-bit clean version of the driver (MacPlot Classic or Pro).

The Tech Info Library article titled "Locating Vendor Information" can help you search for a particular vendor's address and phone number.

Numbers Formatted as Currency are Aligned Left and Don‘t Calculate

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.

Typing a comma or a dollar sign in a numeric entry in a spreadsheet cell will cause Claris Resolve or ClarisWorks to see the entry as text, rather than as a number. In other words, if you type '12,000' into a cell formatted as currency, the entry will show up without the dollar sign, and will be aligned left. If you then try use that cell in the formula of another cell, the entry in that cell will be seen as zero.

To solve the problem, remove any non-numeric characters from the cell.

"Not Enough Memory to Run Application" Messages in Windows NT

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.

If you receive a "Not Enough Memory...." error message when launching an application in Microsoft Windows NT, this is possibly because no default printer has been established for the NT environment. This is more likely to happen when the Windows NT workstation relies on a Windows NT Advanced Server for printing services, which makes it unnecessary to load any drivers for printing. If you open Control Panel - Printers you can check for a default printer and install a new driver if there is no default printer driver present.

Unexpected Quit With Over 64MB of RAM When Using Headers and Footers (WP)

Only occurs in ClarisWorks 2.0v1 (fixed in ClarisWorks 2.1v2)

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.
On a Macintosh with 64MB of RAM or more, ClarisWorks 2.0v1 crashes after closing a word processing document with a header or footer. The crash affects only the application and displays the error message Òapplication unknown has quit, due to an error of type 1.

To recreate...
1) Launch ClarisWorks 2.0v1 on a machine with 64MB of RAM (or greater) or set the available RAM to 64 MB using virtual memory in the Memory Control Panel.
2) Create a new word processing document.
3) Insert a header, footer, or both.
4) Close the document.
5) Select "yes" or "no" when prompted to save the document.

This has been recreated on the following Macintosh models: Quadra 800, 950, Centris 650, Macintosh IIfx, and Macintosh IIci (all running System 7.1). ClarisWorks 1.0 does not crash under these conditions.

Invisible Characters May Disappear When Text is Right Justified (WP)

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
Invisible characters may disappear when text is right justified. Try this test:

1. Create a new Word Processing document in ClarisWorks or a new Report document in ClarisImpact.
2. Press the Return key
3. Turn on Show Invisibles from Preferences
4. Press the up arrow once to move the cursor to the first line
5. Click the Right Justify icon in the menu bar

Notice that the invisible representing the Return has disappeared but will reappear if Left Justification is chosen. This can happen with other types of invisible characters (such as a page break) if Right Justification is chosen.

Using the Check List Outline Format - Be Sure to Save Changes (WP)

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
This happens in ClarisImpact 1.0 and Claris Works 2.0 (including localized versions). It is fixed in ClarisWorks 2.1

If you use the Check List Outline Format to keep track of things completed you need to be sure to save your document.

To see the error: if you open a previously created ClarisWorks 2.0 or ClarisImpact 1.0 Word Processing document using the Check List Outline Format, put a check in one of the boxes to indicate that an item has been done/completed, then close the document, you will not be prompted to save changes. Upon reopening the document, you will find that the check box is no longer checked.

To work around the problem, do some sort of text editing in the document or select Save from the File menu before closing.

Hardware/System Requirements and Compatibility for ClarisWorks 2.0 and 2.1 for Macintosh (All)

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
Required Equipment:

· Apple Macintosh Plus, Centris, Classic, LC, SE, Performa, PowerBook, II or Quadra family computer
· Hard disk drive and minimum 1 MB memory
· 2MB memory for System 7 and communications environment
· System software 6.0.5 or later, System 7, or System 7 Pro

(Note: To take advantage of 2.1's support for PowerTalk, System 7 Pro is required. 2.1 will run on System 6.0.5 or later, but will not support PowerTalk without System 7 Pro. Version 2.0 does not support PowerTalk, but will run with System 7 Pro as well as with 6.0.5 or later and any version of System 7 thru and including System 7 Pro).

A list of specific printers which have been certified or verified as fully functional with ClarisWorks 2.0 is not available. In general , a printer that is compatible with Apple print drivers and/or the above referenced Systems should work with ClarisWorks 2.0.

Installing ClarisWorks on a Server for Network Installations (All)

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
Use the following procedure to install ClarisWorks on a central server volume so that it can then be installed through the network from, and onto, any networked Macintosh computer:

1) Create a folder on the server called ClarisWorks Install Files.
2) Drag copy each of the three disks of the software into this new folder. This will create three folders named Disk 1, 2 and 3.
3) Now open the folder called Disk 1 and option-drag the two files: Installer and Installer Script "up" one layer, i.e. out of that Disk 1 folder but still in the ClarisWorks Install Files folder. This will make a copy of the files so that they exist in the Disk 1 folder as well as the ClarisWorks Install Files folder.

To install from a networked Macintosh computer:
1) Find and open the ClarisWorks Install Files folder
2) Double-click the Installer Script file. This will "unstuff" and install the ClarisWorks files onto the local computer's hard disk.

These instructions are provided with the understanding that you have purchased sufficient copies of the product to comply with the software licensing agreements that apply to it.

A/UX: How To Partition 45MB Removable Drive

I would like to format and partition a 45MB removable cartridge for use with A/UX. Because HD SC Setup does not recognize the Mass Microsystems 45MB removable drive, can this be done? I seem to remember a command called "dformat" from prior UNIX experience with a Plexus machine.

This article has been archived and is no longer updated by Apple.
According to Mass Microsystems, their 45MB removable drive does not work under A/UX at this time. It works only under Macintosh OS.

Fortunately, we found a solution by the Usenet comp.unix.aux newsgroup at Stanford University. They posted a fix for the SyQuest SQ555 44MB (and possibly other) removable hard disk drives to work under A/UX 1.1.

We tried the patch program under Macintosh OS, and it does work under A/UX 1.1. Basically, the patch program sets the Error Page Parameter correctly so that the parameters are compatible with A/UX.

The Insertion Point (Cursor) Doesn‘t Move Across The Page To The Right (WP)

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
Symptom(s):
Upon opening a new ClarisWorks Word Processing document or a new ClarisImpact Report document, the insertion point just stays on the right margin even after you begin typing. As you continue to type, either the text wraps down to the second line before you get to the end of the first line, or the text goes to the end of the first line but does not wrap at all - seemingly disappearing somewhere into an abyss behind the right margin.

Holding down the Delete key eventually begins to delete those characters you type on the first line, after it deletes the characters you can't see, yet you did type.

When you choose Select All in the Edit menu, the very first character you typed selects (sometimes, a fraction of that character) or the entire document selects. If your text wrapped inappropriately, notice that the area to the right of the text selects - though it cannot be deleted.

Cure: Troubleshoot the Fonts folder. The above conditions seem to occur only with System 7.1. Usually, the font is the default, Helvetica. If you can select the whole document, just changing the font by selecting another font in the Fonts menu should bring the desired result. If so, delete Helvetica from your Fonts Folder and copy it back to your System Folder from the Fonts disk of your System disks.

Graphics Export Result in PICT or EPSF with Too Many Pages (DR)

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.

In the applications which use the Claris Graphics Engine, it is possible to adjust the drawing size for your documents separately from the absence or presence of objects on that page. This can cause difficulties when you wish to export your document for use in another application and have made changes to the drawing size.

In other words, if you have a multi-page Drawing document, you can reduce the number of pages in your file. (To do so in ClarisWorks (all versions), you use the Format menu and choose Document; in ClarisImpact you use the Layout menu and choose Document.)

However, if you have placed objects on the deleted pages prior to removing the pages, objects which are on the extra pages are not deleted. If you use the Save As... command to save your file in a transfer format like PICT or EPSF (the latter not an option from ClarisWorks) the resulting PICT or EPSF file will have a drawing size which is large enough to include all of the objects in the document, not just the objects on the displayed pages.

For example, if you have a 10-page vertically-oriented drawing document, and place a line at the bottom of page 10, then go to the document format dialog and change the number of vertical pages to 2, the line at the bottom of page 10 will no longer be visible. If you use the Save As... command to create a PICT file from your 2-page document, the PICT image will be 10 pages tall, and will have a line at the bottom.

This also happens in ClarisWorks Windows when saving to PICT or Windows Metafile formats.

To avoid this, be sure to delete all objects from any pages that are no longer used and will be deleted in the document format dialog.

This is not an issue in MacDraw Pro, MacDraw II or Claris CAD, which do not allow you to make the drawing size smaller than the size of the objects in the drawing area.

Using the MONTHNAME Function in ClarisWorks (DB,SS)

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.

In ClarisWorks and ClarisImpact, to calculate and display the name of the month which has been entered into a date field, you must use the Month function to get the month number, then use the MONTHNAME function on that value.

ClarisWorks Database:
Here is a calculation to extract the name of the month from a date field:
Month = (Calculation, Text result) = MONTHNAME(MONTH('DateField'))

ClarisWorks Spreadsheet or ClarisImpact Table:
The formula to accomplish the same task, assuming the date is in cell A1 would be:
=MONTHNAME(MONTH(A1))

If you do not use this structure, and attempt to use the MONTHNAME function directly upon a date, you will get an #ERROR! result in the field. (#ARG! in a spreadsheet cell). This is because the MONTHNAME function works on a integer number value from 1 to 12 inclusive, while ClarisWorks stores dates internally as serial numbers representing the number of days since January 1, 1904.

Another Way to Count Words

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
Another way to count words in ClarisWorks or MacWrite II is not with Spell Check but with Find/Change. Here are the steps:

1. Choose Find/Change from the Edit menu.
2. Type a space in the Find section and a space in the Change section.
3. Click the Change All button.
4. Click Okay to the message "The Change All feature is not undoable".
5. The next dialogue box that appears will have a count of how many spaces were changed to spaces and should correspond to the number of words in your document.

If you entered double spaces after every period then ADD the following steps to count your words more accurately:

6. Type a period in the Find section and a period in the Change section.
7. Click the Change All button.
8. Click Okay to the message "The Change All feature is not undoable".
9. The next dialogue box that appears will have a count of how many periods were changed to periods and should correspond to the number of double spaces in your document.
10. Subtract the number of periods changed from the number of spaces changed.

* You may want to backup your file the first time you try this method since you cannot Undo the Change All feature.

If you are going to do this regularly, you may want to upgrade to MacWrite Pro. MacWrite Pro can provide full statistics on your document (word count, paragraph count, modification dates, revision number, etc.)

Also, if you convert spaces to returns, you can import the file into a database and get average word length, a real word count, count the number of "I's", "you's", "and", etc.

Spellchecking a Document With Ligatures (All)

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
The Spellchecker in ClarisWorks and MacWrite don't support ligatures.

These are single letters that represent two other letters, like fi and fl...
ClarisWorks, ClarisImpact and MacWrite do not contain the ability to generate ligatures, but they can be created elsewhere (for example with shareware program such as Add/Strip) and brought into MacWrite or ClarisWorks.

We would need to program our spell checker to convert from ligatures to standard letters (do the spell checking), and back to ligatures again (to replace a spelling) in order for spellchecking to work. We would need to keep track of another set of characters and be able to convert them.

ClarisImpact, MacWrite and ClarisWorks seem to handle ligatures differently. It seems MacWrite will stop sending the text when it hits a ligature and ClarisWorks & ClarisImpact knows it is ligature and sends it anyway, letting the spell checker handle things. The spell checker does not handle these characters.

Example of problem using the word "Traffic", the ligature being used is "fi"....

MWII spell checker doesn't recognize it. What it brings up is the word "traf", seeing the ligature at the end of the word and cutting off the rest of the text.
In ClarisWorks 2.0 and ClarisImpact the spell checker brings up "traf ú c", the "ú" representing an unknown character.

Suggested workaround:
Check spelling on your document first, then convert characters to ligatures.

A/UX: How to Reformat a Third-party Disk for Macintosh OS

I'm working with a large number of A/UX systems with A/UX configuration on Maxtor 200MB disks. However, we need to reinitialize some of the Maxtor disks to all Macintosh OS. Of course, Apple's HD SC Setup doesn't recognize these disks. Can you suggest a disk-formatting product that would successfully reinitialize them?

This article has been archived and is no longer updated by Apple.
How did you format the Maxtor 200MB disks to work under A/UX? You would have needed some type of disk formatter or partition software to format the Maxtor 200MB disks to work under A/UX.

Here are two ways to reinitialize the Maxtor 200MB disks for Macintosh OS only:

1) Since it is an A/UX disk, you can use "dp" under A/UX to repartition the entire disk into a single Macintosh partition. To do this, remove all of the "Apple_UNIX_SVR2" partition types and enlarge the Macintosh "Apple_HFS" partition types.

Note: Do not delete the "Apple_Partition_map" and "Apple_Driver" partition types.

2) Use the Macintosh hard-disk management software called "Silverlining" from La Cie Ltd. For more details, search the Technical Info library under "La Cie."

Subscribers Don‘t Update Until File Is Opened (All)

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
Macintosh System 7 has a feature called Publish & Subscribe, which lets you select a part of your file, call it a Publisher, and link it to Subscribers in other files. If you make changes to the Publisher and use the Save command, the Subscriber is updated automatically. This works because data is stored on disk in an Edition File, which contains the data and any changes to the data. When you open a ClarisWorks 2.0 file with one or more Subscribers, the file checks every Subscriber's linked Edition File to see whether any changes have been made, and if there are changes, the Subscriber is updated.

If both files are open, you can see the updating happening on-screen when you choose Save in the file with the Publisher, because the Subscriber checks the Edition File for changes when it is open.

However, if you do not have both documents open at the same time, updates to the Subscriber from Published data stored in the Edition File will not take place until you actually open the document which contains the Subscriber. In addition, if you make changes to the Publisher and don't save them, the Subscriber will not be updated to show those changes.

This means that if you make changes to a ClarisWorks 2.0 or ClarisImpact file with the Publisher and save, then try to use the Print command from the Finder to print the file with the Subscriber, those changes will not be reflected in the printout. If you open a ClarisWorks or ClarisImpact file with the Subscriber, it will get the updated information from the Edition file on disk and print with the correctly-saved information from the Publisher.

Published Date: Feb 18, 2012

Update to Subscriber Doesn‘t Generate "Save Changes?" Dialog (All)

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
When you have a Subscriber in a ClarisWorks 2.0 or ClarisImpact document, and changes are made to the Edition file to which that Subscriber is linked, then open the document, the Subscriber updates to show the most recent information. (You can see the change on-screen.)

However, if you close the file, there is no prompt to save changes. The changes are not retained until you choose the Save command in the file with the Subscriber, although every time you open the file, you will see the changes take place in the Subscriber.

ClarisImpact: Connectors Don‘t Choose Shortest Distance Between Objects

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
There are situations where the connector between two objects doesn't seem to take the shortest route between them, or when the connector doesn't seem attached to the object.

The most likely scenario for the first problem is when the distance between the two objects is less than the minimum length set in the Connector Settings dialog.

The setting in the dialog is the minimum length for each half of a right angle connector. If you have set a minimum of .25", then you will need at least .5" between objects to get the connector to draw correctly. That's .25" for each half of the connector. There is no minimum length for straight connectors.

For example, if you have two flow chart elements that are .5" apart, and you have the set the minimum connector length to .1", you will have no problem. But if you move the two objects closer together, ClarisImpact will try to find the shortest path between the objects that it can draw, maintaining the minimum length set by the connector.

The solution is to move the objects further apart, or to lower the minimum setting in the Connectors dialog. Another problem that might occur is if the end of the connector is not really 'connected' to an object, but merely rests near it. You can tell if this is the case if you move the object. If they are not connected, the object will move but the connector will not.

You can reattach the connector to the object by clicking and dragging the end of the connector over the point of the object that you wish to connect it to. When the mouse is over a part of the object that it can connect to (an edge, or the center) you will see a small plus sign (+) near the cursor. Releasing the mouse when you have that cursor will attach the connector to the object.

Creating a Title or Blank Lines in an Outline

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
Although the outline mode is a very convenient way to organize information, sometimes you may wish to type text which is not a part of the outline structure.

For example, Legal format begins every topic with a number. You might want to title your outline so that the Label is omitted from the first line, but that would also omit the first outline number. You might also want descriptive notes or extra text under an outline item, but you don't want that text to have outline characters.

However, if you create a text frame, the outline can be pushed below the title using text wrap.

In ClarisWorks:
1) Create your outline using the Outline View option in the Outline menu.
2) To add a title, hold down the Option key on your keyboard and click and drag a rectangular area within your margins at the top of your document. Note that your cursor must be an i-beam, so start your title area to the right of the first topic label. (Be sure to drag an area all the way across the width of the area between the margins. If you do not, the topic label will be to the left of the title, and the first topic will begin to the right of, instead of below, the title.)
3) When you release the mouse, a box will appear over your outline, and the cursor will be blinking within the box. Type in your title, and format the text as desired.
4) Press the Enter key to select the text frame, then select Text Wrap... from the Options menu. Choose regular text wrap, and the outline should move down below the title.

In ClarisImpact:
1) Open a new report.
2) Select To Outline from the Text menu.
3) Create your outline.
4) To add a title, first select the text tool. Then hold down the Option key on your keyboard and click and drag a rectangular area within your margins at the top of your document. Note that your cursor must be an cross-hair, so start your title area inside of the margins. (Be sure to drag an area all the way across the width of the area between the margins. If you do not, the topic label will be to the left of the title, and the first topic will begin to the right of, instead of below, the title.)
5) When you release the mouse, a box will appear over your outline, and the cursor will be blinking within the box. Type in your title, and format the text as desired. Note that text wrap was already selected for the new text object you created, so the Outline was automatically pushed down.

Freehand Objects do not Preview or Print to HP Deskwriter.

If you create an object with the freehand line tool, copy it, quit the program, re-launch the program, then paste that object into a new text frame, that freehand object will not print to an HP DeskWriter printer and the HP Print Preview option will not show the object.

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.
Here's how to duplicate it:

1. Using the freehand tool, draw an object.
2. Copy the selected object.
3. Quit - then relaunch the application.
4. If you are using ClarisWorks, open a new WP document. If you are using ClarisImpact, create a new report document or text frame.
5. Paste. In ClarisImpact, you must use Option-Paste to insert the graphic as an inline graphic.

(Notice that when pasting the graphic as an inline graphic or an object within the text frame, it appears to be inserted correctly.)

6. With an HP DeskWriter driver selected, select Print form the file menu.
7. In the Print dialog box, select Preview.

Notice that the freehand object does not appear.

This happens in the Preview of several different DeskWriter drivers.

Workaround: It seems that if the drawing is grouped, or, consists of several freehand objects - all of which are copied as a group, then pasted following the procedure above, then ungrouped, they print.

Making Text Wrap Work in Drawing Documents

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.

To make the Text Wrap feature work in a ClarisWorks Drawing document or a ClarisImpact Drawing or Presentation document, the Frame Links command must be enabled. This is true even if you will not be linking any frames. [Note that you can set Frame Links for a single text frame or for the entire document. It is easier to simply set this option for the entire document.]

To do this, choose Frame Links from the Options menu. The text will then wrap according to the Text Wrap option that you have set for the graphic object.

If you are using ClarisImpact, the Frame Links command is in the Text menu.

Keep in mind that text will not wrap irregularly around EPSF, imported PICTs or MacPaint or objects which are in Paint frames. For a workaround, see TIL article# 55230: "**Irregular Text Wrap Around Bitmapped Graphics**".

ClarisImpact: Two Kinds of Model Borders

How to see the difference between selecting a Model frame and selecting its contents.

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.

When you select certain models in ClarisImpact, you might see two different types of borders on the model frames. When a model is first created a gray border surrounds the model frame. The gray border indicates that you are working within that model and can modify the elements within (such as adding more rows to a Table).

If only the selection handles appear around the model then it is only possible to modify the model frame itself (such as changing the border color of the model), but not its contents. Try the following steps to see the difference:

1. Create a new model and notice that the new model has a gray border around the edge (and possibly selection handles on each corner)
2. Click anywhere on white space and notice that the model is only selected with handles on each corner
3. Click on the white space again and notice that the model is completely deselected
4. Now try clicking on the model again and notice that only the selection handles will appear
5. Click once more on the model and the gray border will appear

Furthermore, the gray border comes in two varieties: a gray border with selection handles and a gray border with no selection handles. The only two models that do not have selection handles with the gray border are Organizational Chart and Flow Chart. The reason is that it is possible to resize all models except for Flow Chart and Organizational Chart by dragging the selection handles. ClarisImpact gives you instant feedback so that you do not have to remember which models can be resized and which cannot.

NOTE: Objects other than models do not have two levels of selection. For example, if you draw a star, the only indication that the star is selected are the selection handles on each corner.

Claris Applications: Launching Faster in Microsoft Windows NT (WOW)

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
To make launching the first 16-bit application faster, create a icon for WOWEXEC.EXE and put it in the STARTUP group.

Microsoft Windows NT is a 32-bit true operating environment. This does not mean that it cannot run a 16-bit application such as FileMakerPro or ClarisWorks. It will run them in an emulation mode, Window On Window (WOW). WOW is only started when the first 16-bit application is started in Windows NT; therefore, it takes longer for the first application to actually launch.

Macintosh II Video Card: Features (2/95)

This article describes the original Macintosh video card.

This article has been archived and is no longer updated by Apple.
The Macintosh II video card provide scolor capability for simultaneous display of up to 256 colors on the Apple High Resolution Color Monitor. With the card's three 8 bit digital to analog converters (RGB) there are more than 16 million possible colors to choose from.

Color Modes
---
* One bit per pixel for 2 color output

* Two bits per pixel for 4 colors

* Four bits per pixel for 16 colors

* Optional Eight bits per pixel for 256 colors

Video Signals
---
* RS343 Analog RGB for Apple High Resolution Color Monitor

* RS343 Analog Green signal for Apple High Resolution Monochrome Monitor

* RS170 Composite interlaced video for analog RGB monitors, film recorders and projection TV's

* RS170 Analog Green signal for composite interlaced video with sync for analog monochrome monitors, film recorders, and projection TV's

Hardware Features
---
* Multiple video card operation for larger screen area For example, 2 cards handle 2 video screens for viewing different or large format documents.

* Standard VIDEO RAM configuration of 256K for 1, 2, and 4 bit color modes 8 chips of 150NS 64x4 KBit Video RAM.

* Upgraded VIDEO RAM configuration of 512K for 8 bit color mode 8 additional chips of 150NS 64x4 Kbit Video RAM

*** Video RAM contains a shift register for the copying of rows of bits from the RAM array. This allows reads and writes to the RAM array and the shift register simultaneously. This is not a feature of standard or common RAM and is necessary to the workings of the video card.

* Two Oscillators provide timing signals of:
30.24MHz for Macintosh II monitors (RS343)
12.27MHz for RS170 monitors (Composite Monochrome interlaced video)

* Slot independent operation

* Triple 8 bit digital to analog converters for 2 to the 24th colors equalling 16.8 million.

GS/OS: Disk Dialog Enhancement Request

A school wants to "alter" the way the Apple IIGS works with 5.25-inch disks. They have "standard" Apple IIGS systems with 3.5-inch and 5.25-inch disk drives. The students use the 5.25-inch drives for their data disks and run the applications from the 3.5-inch drives.

They start up the Apple IIGS with a 3.5-inch disk, and they get the 3.5-inch disk icon and the 5.25-inch disk drive icon. If a student puts a 5.25-inch disk in the drive and double-clicks the drive icon, the system mounts the disk and shows the 5.25-inch disk icon. If the student double-clicks the disk icon before a disk is inserted, the Apple IIGS says that the disk is unreadable (there is no disk), and asks the user to "Eject" or "Continue". The students insert their disks, because they know the system can't eject something that's not there. Then, they click "Continue". The Apple IIGS then formats (erases) their data disks.

Can you change the dialog box that asks if you want to "Eject" or "Continue" to "Stop" or "Continue" (or something to that effect)? Can the drive detect that there is no disk inserted and give a different dialog box?
This article has been archived and is no longer updated by Apple.
In GS/OS 5.0.2, you get two dialog boxes when an empty 5.25-inch drive icon is double-clicked. (This also occurs when the 5.25-inch drive contains a blank or unrecognizable disk.)

The first dialog is the one you describe with the "Eject" and "Continue" buttons. The second is a dialog asking to "Cancel" or "Initialize". This is where the user has the opportunity to stop the initialization process.

Because the first dialog is dismissed only with a mouse click, the possibility of pressing the Return key too many times is eliminated. However, the second dialog defaults to the "Initialize" button; therefore, pressing the Return key causes the disk just inserted to be erased. However, if the "Cancel" button is clicked, the initialization process is terminated. Thus, there is a two-step process to invoke the initialization operation.

Dictionary Information for Scriptable Claris Applications

Here is a brief explanation of how the dictionaries are generated by AppleScript and how they are useful in learning how to use AppleScript with Claris Applications.

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.
Applications that are "Scriptable" by scripting applications such as AppleScript contain a resource called the "AETE Resource". If an application does not contain the resource, it can not be sent events by AppleScript. The following Claris Applications contain this resource:

MacDraw Pro 1.5
MacProject Pro 1.5
FileMaker Pro 2.0
Claris Resolve 1.1
ClarisWorks 2.x (NOTE - Though an AETE resource is available, AppleEvents are NOT a supported feature of ClarisWorks)

This resource contains information about the application's ability to accept Apple Events sent to it by other programs. AppleScript can take the information in this resource and compile a dictionary of the events and objects for that application.

The dictionaries are organized by the particular suites the events fall into. For example, FileMaker Pro supports events for the 1) Required Suite, 2) a special subset of the Core, Table, and Database suites, and 3) its own FileMaker Suite. Each suite has information regarding the specific events such as 'Duplicate', and 'Open', that fall into its suite. Also included in the suite information are details regarding the classes of elements that the events can be applied to such as Application, Field, Record.... etc. In addition, there are properties that describe aspects of the elements (for example, one property of layouts in FileMaker Pro is whether they are protected by any access privileges) in the dictionary. For more information about AppleScript's dictionaries, refer to "The Tao of AppleScript" published by Hayden Books.

It is important to use the syntax detailed by the dictionary in order to use AppleScript with the chosen application. For example; FileMaker Pro can count the number of objects in any given class (such as scripts) and return that number to AppleScript. So if we want to get this number we might be tempted to create an AppleScript like this

"Count the number of scripts of document 1".

In essence this is correct. however, executing this script would return an error because it does not follow the syntax set forth in the dictionary. The correct statement is:

"Count the number of FileMaker Script of document 1".

Notice that the statement says "FileMaker Script" and is singular. Semantical differences like this are important and, if paid attention to, will make the learning process of scripting Claris Applications much easier.

It is also important to recognize that AppleScript is a powerful tool. Using its ability to create dictionaries will greatly speed up the learning process of using it with Claris Applications.

Files Exported as EPSF in any Claris Application will not Print from Quark 3.2

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.

Files exported as EPSF in any Claris application will not print successfully from Quark XPress 3.2. The document will either not print out at all, not even generating an error message, or generate a Postscript error: error undefined, offending command: objectcoord.

Quark is aware of the problem and said it would be fixed in 3.3. Some customers have confirmed this. However, a ClarisDraw customer reported that the problem remains in 3.3.

An option is to use Quark 3.0 or 3.1. Also, try contacting Quark for further information.

MacDraw Pro: Printing Handouts with LaserWriter

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
When printing handouts with the LaserWriter 8.1 driver, text will not print after the first page. The LaserWriter 8.1 driver will only print the graphics on all subsequent pages.

There is a Read Me note that comes with the 8.0 driver and it indicates that there will be some difficulty when printing with the 8.1 driver and MacDraw Pro.

Workaround: Change to the LaserWriter 7.2 driver if you need to print handouts.

GS/OS: //WRITE and Network Printing

I have now experimented with a variety of different settings and still can only be sure of getting AppleWorks to print to a LocalTalk ImageWriter. Another major problem I found was inserting a disk with software that GS/OS doesn't recognize (specifically, //WRITE from Random House Media).

I found a "solution" with some bugs. Here it is. I use the old AppleShare GS Workstation disk. Select CHOOSER.II from the menu, select the LocalTalk printer, escape from the menu, and choose the option that lets you provide a pathname to the software you want to use (in my case, //WRITE). This is where the problems arise.

1) On the new ROM Apple IIGS, the keyboard seems to be remapped so that the "/" key produces a "}". The only way to get the "/" is by using the one on the numeric keypad. On an older Apple IIGS, the keyboard is normal. Why?

2) A second problem arises after //WRITE is launched, and I've created a document and sent it to the printer. On the new ROM Apple IIGS, it goes to the printer, prints successfully, but the screen seems to go into 40-column mode. The machine still works, but you can't read the text (letters overlap). On the older Apple IIGS, everything works the same, but the screen remains normal. Why?

3) Can the menu that appears on the Workstation Disk be edited to place the name of the application in it and delete options I don't want users to play with (System Utilities, Server Log-on, and so on)?

This article has been archived and is no longer updated by Apple.

1) The only way we were able to duplicate this result was to go to the Control Panel, select the Alphabet device, and set the Keyboard item to "Spanish". In other language selections, various other characters were displayed. Only in the "Spanish" setting did the "}" character appear.

2) According to the people at Random House, they discontinued their software division about two years ago. We could not find anyone at Random House who knew anything about //WRITE, which is at least two years old. Without Random House assistance with this issue, we were unable to find a workaround to the 40-column problem.

3) The menu items are hard-coded into the menu application. There is no way to change the items in the list. Aristotle or Let's Share are the only network menu systems that can be modified.

Black and White Paintings Printing Inverted with LaserWriter 8.0 Driver (PT)

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
This has been corrected in ClarisWorks 2.1.

A Black and White painting may invert when printing if the following conditions are true:

1. Depth is set to Black and White from the Resolution & Depth dialog box
2. You are using the LaserWriter 8.0 driver
3. You are printing in Color/Grayscale rather than Black and White

Workaround:
Set your print driver to Black and White rather than Color/Grayscale. To do this:

1. Choose Print from the File menu
2. Click Options
3. Choose Black and White
4. Click Okay
5. Click Print

Locking the Title position of a Row and a Column (SS)

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.

It is possible to lock several Rows and several Columns at once but the manual only covers how to lock columns or rows (page 6-26 of the ClarisWorks User's Guide). For example, let's say you wanted to lock Column A and Rows 1 & 2. Follow these instructions:

1. Click to select Column header "A" (this will highlight the entire column).
2. Choose Lock Title Position from the Options menu.
3. Click and drag to select rows 1 & 2 at the far left to select entire rows.
4. Choose Lock Title Position from the Options menu.

To lock Column A & B and Rows 1 & 2:

1. Click and drag to select Column header "A" and "B".
2. Choose Lock Title Position from the Options menu.
3. Click and drag to select rows 1 & 2 at the far left to select entire rows.
4. Choose Lock Title Position from the Options menu.

ClarisWorks Spreadsheet: Behavior of Data in Wrap Aligned Cells

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.

In the Spreadsheet environment of ClarisWorks 2.0, in addition to regular alignment controls, you can choose an alignment option called "wrap." This option allows you to have flowing text inside a spreadsheet cell. It is an extremely useful feature if you wish to create text tables and multiple lines of text inside a cell. With cells that have the wrap alignment assigned, you can set the row height to be very tall, and have the text fill the cell from top to bottom.

This can be a problem, because the wrap alignment option handles entered data differently based on the type of data that has been entered:

If you simply type text into the cell, it will appear at the top of the cell, starting at the left (or any alignment position that you have specified).

If you enter a number, it will appear at the bottom of the cell, aligned at the right (or any alignment position that you have specified). To make the number appear at the top of the cell, you must enter an Option-space after the number. (Keep in mind that this makes the number a text value.)

If you enter a formula into the cell, the result of the formula will appear at the bottom of the cell, aligned left or right, depending upon the format of the formula result. (text is at the left by default, numbers are at the right) If you have chosen an alignment option, it will override the default settings.

There is no workaround that would allow you to change the baseline inside the cell and move the results of formulas to the top of the cell.

How to use Outlines and Regular (non-outlined) Text in the Same Document (WP)

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
In ClarisWorks 2.0 and ClarisImpact, sometimes you might wish to use Word Processing or Report documents that have Outlines inside them, but not have the entire document be formatted as an Outline.

To create an Outline within a Word Processing document, simply create a text frame and choose Outline View from the Outline Menu (ClarisWorks) or To Outline from the Text Menu (ClarisImpact). The text frame will have the outline formatting and the main body of text will not.

A Text Frame can be created in a ClarisWorks Word Processing document by selecting the text tool and holding down the Option key while dragging out a frame.

To create a Text Model in a ClarisImpact Drawing document, simply select the text tool and drag out a frame. In a Report document, select the text tool and hold down the Option key while dragging out a frame.

ClarisImpact: All About Object Libraries and Clones

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.

One of the features that makes ClarisImpact so easy to use is Object Libraries. Claris provides a plethora of Object Libraries with ClarisImpact and you can also make your own. An Object is any picture, text or model. A Library is a place to archive objects. To use an existing Library first make sure you have installed the ClarisArt folder (Easy Install will automatically install this folder of graphic libraries or you can use Custom Install) and then follow these steps:

1. Create a new ClarisImpact document or open an existing one.
2. Choose Open Library... from the File menu.
3. Navigate to the ClarisArt folder and open any Library such as "Animals (B&W)".
4. Double-click on the desired Object Library.

Once you have found an object you would like to place on the document:

1. Move the mouse arrow onto the object in a Library and notice that the Arrow turns into a Hand.
2. Click and hold the Hand on the object and then move the mouse to the document area (a rough outline of the object should move with the Hand).

3. Let go of the mouse when you are at the desired location of the object.

An alternate way of adding an object from a Library to a document:

1. Click in the document where you want the picture to be placed.
2. Click on the object in the Library palette so that it highlights.
3. Click the Use button.

Adding a picture to an Object Library is just as easy. First draw a picture using the ClarisImpact drawing tools or import an existing PICT, GIF, TIFF or EPSF type graphic. To import a picture:

1. Create a new ClarisImpact document or open an existing one.
2. Click in the document where you want the picture to be placed.
3. Choose Place File... from the File menu.
4. Navigate through the dialog box to the location of the picture.
5. Double-click on the desired picture.

To add a picture from a ClarisImpact document to a Library:

1. Open a existing Library from the ClarisArt folder.
2. Select the object in the document you want to add to the Library.
3. Click the Add button in the Library floating palette.

To add many objects at once to a Library simply select multiple objects and then click the Add button on the Library floating palette. NOTE: Selecting many objects can done by using the Shift key when clicking on additional objects, by using Select All from the File menu or using the arrow tool to draw a selection rectangle around the objects. If you want to add many objects to a Library as one picture use the Group feature from the Arrange menu before clicking the Add button.

Creating your own Object Library is just as easy. Just choose New Library from the File menu and an Untitled Library will appear. Here is a good time to point out the menus on the Library floating palette. Notice that each Library floating palette has a set of menus: File, Edit and View. Choose Save As... from the File menu on the Library floating palette to archive your own custom Object Library. The View menu has an interesting menu choice called "View Options...". This allows you to change the way the Library floating palette looks.

Also, notice the triangle just to the right of the Use button. Clicking on the triangle will make more choices available such as Rename and Find. Rename allows you to change the name of an object. Find allows you to locate an object in a Library that has grown too large to easily scroll through.

When an object is moved from a Library into your document a Clone is made. Clones can be useful if you decide to edit an object but have used that same object in many places throughout your document. As an example, place two different objects from a Library many times into a single document. NOTE: Only the first copy of an object needs to be placed in the document using an Object Library. Subsequent copies of an object can be copied and pasted or duplicated. Next, change any of the objects to a different fill color. What if you wanted all of your objects to be changed to the new color? Follow the steps below:

1. Select the object that has the fill color.
2. Choose Replace Clones... from the Edit menu.
3. Notice that the only Master Objects that appear in the scrolling list are those that have been placed from an Object Library.
4. Click the button Use Selected.
5. Click Replace All.

ClarisImpact 1.0: Hardware Requirements

CPU, RAM and Hard Disk space Requirements for installation and use.

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.

· Macintosh SE, Classic, LC, Performa, PowerBook, Macintosh II, Centris or Quadra family computer (LCII or later recommended)
· Hard disk drive and minimum 2 MB memory (4 MB Recommended)
· 4MB memory for System 7
· System software 6.0.7 or later, or any version of System 7
· For Complete Installation approximately 20 MB of free HD space is required

NOTE: When installing, ClarisImpact needs additional space on disk for temporary files. Therefore, installing will require more than 20 MB of hard disk. The temporary files will be deleted after installation is complete.

Also, if you do not wish to use 10.5 MB of hard disk space for ClarisImpact, you can limit what is installed by ClarisImpact. For instance, you may not want the 7.5 MB of clip art that is included with ClarisImpact. Either trash the ClarisArt folder after doing a full installation or try a custom install right from the beginning. For more information on custom installation see TIL article# 55729: "**ClarisImpact: Disk Space Sizes for Custom Installations**" .

Published Date: Feb 18, 2012

Macintosh: Making Multicolored Silk Screen Masters

Do you know of a way to use a Macintosh, scanner and a LaserWriter to make silicon film and, from this film, make multi-colored silk prints?

I read about something like this; I believe that the "system" was called PENTAGRAPH. The article also stated that "CAD is a newcomer to the silk print industry. ..."

Do you have any information on such a product?

This article has been archived and is no longer updated by Apple.
The only process that appears to be similar to what you want is called "silk-screening". If this is what you are looking for, part of the solution is Macintosh-based, and part of it is based on traditional silk-screening techniques. Here is how silk-screening works:

Silk-screening is a photographic process. A light-sensitive emulsion is layered onto silk. This emulsion is exposed through an image on a film positive, much like creating an image on photographic print paper. Once exposed and processed with photographic-type chemicals, the silk lets ink to pass through unexposed areas and blocks the passage of the ink exposed areas. Any material placed under this processed silk screen receives the ink that passes through. This leaves an image on the material under the silk screen. This is the portion of the process that is based on traditional silk-screening methods. A graphics supply house should be able to provide all the tools and materials required for this phase of the operation.

The Macintosh can be used to create the film positive, which replaces the usual photographic film positive. Any software that prints to the LaserWriter can be used to create this image, including graphics and CAD software. Once the image is created, printing an image on transparencies provides the equivalent of the film positive. You will, however, be limited to the size of transparencies that fit into the LaserWriter.

To create multiple colors, use one transparency for each color. This requires some type of color separation capability: either direct color separation in the application, or an application that provides several layers of images--one layer for each separate color.

Comparison: ClarisImpact Flow Chart and Org Chart

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
ClarisImpact Flow Chart and Organizational Charting tools are designed to compete with leading dedicated programs such as TopDown and OrgChart Express by Kaetron Software Corp., OrgPlus for Macintosh by Banner Blue Software, or EasyFlow by HavenTree Software. Many of the features found in these programs can be found in ClarisImpact.

Features include displaying names in a multiple of ways, moving objects freely with links, assigning different connection line widths to objects, and publish and subscribe. Other features which can be found in both ClarisImpact and dedicated products are:

· Drawing boxes and connecting lines automatically
· Formatting with style sheets
· Custom chart styles
· Custom border styles
· Different levels of magnification
· Customizable and ANSI symbol
· Auto Line rerouting when moving or resizing objects or symbols
· Color picker and pattern support
· Frames automatically expand or shrink when adding or deleting symbols
· Import custom symbols
· Word wrap
· Find and change
· Open multiple documents simultaneously
· Columns inside symbols
· Create dividers inside symbols
· Ability to change measurement size (i.e. pica, metric, inches)
· Manual or full control over connecting line placement
· Header and Footers with automatic page numbering (ClarisImpact Report Document)
· Auto connect multiple symbols to one symbol

One of the major advantages ClarisImpact has over dedicated packages is its ease of integration: the Flow Chart or the Organization Chart can be placed and edited in a ClarisImpact Report or Presentation. Placing or importing a chart created by a dedicated package into a word processing or presentation software package would involve exporting and importing using a compatible file format. ClarisImpact eliminates the need for import and export since these tools are easily accessible in the Draw, Report, or Presentation modules.

Several features not supported in the ClarisImpact Flow Chart and Organizational Chart which are supported by dedicated packages include:
· Password protection for sensitive data with multiple levels
· Page view
· Collapse or expand branches
· Export DXF, GEM, HPGL, PCX, SYM, WPG
· Printing languages ESC-L graphics, DMPL and CaPSL

ClarisImpact: How to set Timelines to a 40-hour Week

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
MacProject Pro uses calendars to determine the working schedule of a Timeline. ClarisImpact is not quite as sophisticated but limits can be specified so that the durations you enter are calculated on a 40-hour work week (skipping weekends).

1. Create a new Timeline Model
2. Click on Custom from the resulting dialog box
3. Change Days/Week to 5
4. Change Hours/Day to 8

While MacProject Pro can specify Holidays when determining durations, ClarisImpact cannot.

Macros Don‘t Convert When Converting A File From ClarisWorks 1.0 to ClarisWorks 2.0 (All)

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.

If you have recorded macros in a ClarisWorks 1.0 file, those macros will be lost upon converting the file to version 2.0. The macros must be recorded again after the conversion to 2.0.

Published Date: Feb 18, 2012

Multi-Monitor Presentations

When doing a presentation in ClarisWorks 2.0 or ClarisImpact how can I get the slide show to appear on my second monitor? I tried moving the window to my second monitor but the slide show keeps moving back to my startup screen.

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.

ClarisWorks 2.0 and ClarisImpact show their slide shows on your startup screen regardless of what screen your document is actually on. To change your startup screen follow the procedures below:

1. Quit ClarisWorks 2.0 or ClarisImpact.
2. Choose Control Panels from the Apple menu.
3. Notice that one of the screens has a tiny menu bar on it.
4. Grab the menu bar and move it to the other monitor.
5. Restart your computer and try the presentation again.

(Note that, depending upon one of the settings in the Monitors Control Panel, you may not need to restart your machine. If you've selected "Rearrange Upon Close" instead of "Rearrange Upon Restart" then you just have to close the Monitors Control Panel to change the arrangement of the monitors.)

ClarisImpact: Resizing Multiple Columns in Table or Timeline Models

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.

It is possible to resize multiple columns in the Table and Timeline models. Follow the steps below:

1. Select the entire column(s). This means each row in all the columns you want to resize.
2. Move your cursor onto a column divider in the top row until your cursor changes.
3. Click and hold down on the column divider and drag left or right.

ClarisImpact: Text Appears Jumbled

Text in a model appears jumbled. The dates at the top of a Timeline are written over each other. The Labels in a Chart are garbled.

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.

Make your Model frame wider so that the frame contents fit better within the frame boundaries. You can do this by clicking once on the Timeline frame so that the selection handles appear, then click and hold down your mouse arrow on one of the selection handles and drag.

If you are working with the Timeline Model, you can also try the following solution. Select the Timeline by clicking on it. Choose Timeline Scale... from the Timeline menu. You will see a dialog box where you can change the timeline scale to a larger division. For instance, change the timeline scale from weeks to years. Because a larger scale has fewer data points, you may find that individual data points do not overlap.

ClarisImpact: Ungrouping a Model Makes it a Picture

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
The following Models can be Ungrouped easily from within ClarisImpact so that they can be edited like any other drawing created in ClarisImpact:

Flow Chart
Organization Chart
Calendar

* Other Models can be Ungrouped and the methods for doing so are covered below.

Common uses for Ungrouping a Model:
1. You want to remove an element from one of the Models but ClarisImpact does not have a feature for removing that item. For example, maybe you would like to remove an axis or the numbers on the axis from a Data Chart.
2. You want to change one of the elements in one of the Models but ClarisImpact does not have a feature for modifying that element. For instance, you might want to change the dotted lines between the rows and columns of a Timeline to solid lines or longer dashes or a different color.

Selecting a Model for Ungrouping:
Ungroup is located under the Arrange menu but will remain grayed out if the Model is not selected correctly. Before Ungrouping, make sure that the Model you want to Ungroup is selected only with the black selection handles on each corner and not the gray selection border. If the gray selection border is showing then press the Enter key and the Model will then be properly selected for Ungrouping. If your Model is not yet selected then click on it once to properly select it for Ungrouping (clicking twice will select the Model using the gray border).

What happens to the Model:
Once a Model is Ungrouped it no longer has the same characteristics/attributes of the Model tool that created it. In other words, Ungrouping a Model changes it to a drawing. A warning message will appear stating, "Once ungrouped, you will not be able to edit the Model using Model Tools and commands. Continue?". In the case of the Models that cannot be Ungrouped easily, the menu choices Ungroup and Group are grayed out.

How to Ungroup other Model Types:
You can ungroup a Data Chart if you first separate the data table using the Separate Table command from the Chart menu (the Separate Table command will only be available when a Data Chart Model is selected with the gray border). When separating a message will appear stating, "Separating the Table from the Chart will make the Chart values only modifiable from the Table. Continue?". Once separated you will need to cut and paste the Chart so that it can then be Ungrouped. If you do not cut and paste the chart, Ungroup will remain grayed out. If your Data Chart has been created from a Table using the Make Chart Command under the Table menu then you will not need to Separate the Table since it already is separated. Simply cut, paste and then Ungroup.

If you wish to Ungroup a Table or Timeline Model you will need to paste the Model into the Scrapbook temporarily. In order to paste a Model into the Scrapbook you will need to first select it with just the black selection handles. Once this is done, cut and then paste the Model into the Scrapbook. Now that your Model is in the Scrapbook, cut it from the Scrapbook and paste it into your ClarisImpact document. Now you will be able to Ungroup it. This method can also be used with a Word Processing or Outline Model but since there is only text in one of these Models and mostly text in the other it will not be helpful to Ungroup these two types of Models.

Warning:
Make a back-up of your Model in case you make a mistake or decide you need to modify the Model with the Model tools again. In other words, once a Model is Ungrouped it will remain a drawing forever.

ClarisImpact: What does the Extract Button Do?

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
When adding element styles for a Timeline, Chart or Table you have the added capability of copying the currently selected element to the Element editor. This makes it very easy to take an element that you have been working with, and define it as a style. This is done by clicking the Extract button. Follow these steps to locate the Extract button:

1. Create a Chart (or a Timeline or a Table)
2. Select an element in the Chart such as a bar from a bar chart
3. Choose Element Styles... from the Chart menu
4. Click once on the triangle that appears in the resulting palette
5. Click on the Add button
6. The Extract button should be in the lower left hand corner of the resulting dialogue box

ClarisImpact: Explanation of Cursor Appearance Changes

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
The ClarisImpact cursor will change during a creation of a document.

Some advantages of changing the appearance of the cursor include:
1) You know if you've chosen a frame or the contents of the frame.
2) You know whether or not there is another step to the current action.
3) The cursor changes depending upon its position over your document.

Each time a new frame is selected or an object is changed, the cursor will change to let you know the status of the operation. If no frame is selected, clicking and dragging will produce a hand with a pointing finger.

When selecting a new frame to be created, such as an outline or a table, the cursor will change from the Selection Tool (Arrow) to a Crosshair (+). After the frame has been created, the cursor will change to:

Text Frame = I-Beam
Outline Frame = I-Beam
Spreadsheet Frame = Thick Plus
Chart Frame = Thick Plus
Time Line Frame = Thick Plus (by clicking above the Task name but below the frame edge, the cursor will change to a arrow pointing down. Clicking with this cursor will highlight the column.)
Organization Frame = Gray Arrow. When adding or editing text, the cursor will change to an I-beam.
Flow Chart Frame = Gray Arrow. When adding or editing text, the cursor will change to an I-beam.
Calendar Frame = Gray Arrow. When adding or editing an event or banner the cursor will change to an I-beam
Line = Crosshair (+)
Shape = Crosshair (+)
Grab Hand = Selecting an object from a library palette
Arrow with small marquee = indicates that you can move the frame

OmniPage: Incompatible with Macintosh Portable

I have a Macintosh Portable and want to know if OmniPage scanning software works on the system. It wasn't listed in the compatibility list in a recent Apple mailing.

Also, will a half-page or hand-held scanner work with the Macintosh Portable? Is there a list of scanners and scanner software that work with the Macintosh Portable?

This article has been archived and is no longer updated by Apple.
OmniPage requires a 68020-based system with 4MB RAM to run. With these requirements, OmniPage will not work on the Macintosh Portable. We have yet to contact CTA, publishers of TextPert, but their package is listed as running on any Macintosh with a minimum of 1MB RAM.

We don't know of a list of compatible scanners and scanner software. However, Logitech (ScanMan) and Thunderware (LightningScan) indicate that their products work fine with the Macintosh Portable.

For more details, search the Technical Info library under "CTA."

Creating Outlines Within Word Processing Documents

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
In ClarisWorks 2.0 and ClarisImpact, sometimes you might wish to use Word Processing documents that have Outlines inside them, but which aren't completely formatted with Outline topic numbers.

To create an Outline within a Word Processing document, simply create a Text Frame or a Text Model and choose Outline View from the Outline Menu (ClarisWorks) or To Outline from the Text Menu (ClarisImpact). The Text Frame or Text Model will have the outline formatting and the main body of text will not.

You may also want to consider using the Text Wrap feature on the Outline. See the following articles for more information:

"Making Text Wrap Work in Drawing Documents"
"Wrapping the text in a Text Frame or a Text Model wrap Around a Picture"

Using the MacWrite 5.0 XTND Translator for Older Versions of MacWrite

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
The MacWrite 5.0 XTND translator opens MacWrite files from versions 4.5, 4.6, 5.0 and 5.01. The MacWrite 5.0 XTND translator is included with ClarisWorks, MacDraw Pro, MacWrite Pro (all versions); also with MacWrite II 1.1 (all versions).

This translator will not open MacWrite 2.2 files. If you need to open a MacWrite 2.2 file into one of the Claris applications listed previously, use either of these two methods:

1- Open the MacWrite 2.2 file in Microsoft Word, then save out as any file type that your Claris application can open (Word, MacWrite, MacWrite II, RTF, etc.). You can then open this file into your other Claris application.
2- Open the MacWrite 2.2 file using MacWrite 4.5, 4.6, 5.0 and 5.01. Resave, then open the file into your other Claris application.

Note: MacWrite 4.5 runs only on 68000-based Macintosh computers. MacWrite 5.01 will open and save using System 7.1 and earlier, but only on older Macintosh models (Quadra 700 and earlier).

Publish and Subscribe not Working when Edition File is Moved to a New Computer

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
Publish & Subscribe may not update the Subscriber when the Subscriber, Publisher and Edition files are moved to another computer. Publish and Subscribe is networkable so as to facilitate group editing of a document. Even if you move the Edition file along with the Publisher and Subscriber documents, the original path to the edition file is remembered. Tests at Claris showed that launching the files on a different computer will initiate an attempt to mount the volume of the original computer if file sharing is enabled.

Workaround:
If you do not want your files to remember the original location of the Edition file then create a new edition file at the computer on which you wish to use the files.

Calculating a Date 30 Days From a Date Field (DB)

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.

Sometimes you may want to use a calculation to determine the number of days from a specific date. For example, you may enter a purchase date and want to have a calculation add 30 days to determine the due date of the payment. Use the formula below to add 30 days to a field called PurchaseDate, where the result displays in a field called DueDate. The DueDate formula is

DueDate (Calculation, Date result) =
DATE(YEAR('PurchaseDate'), MONTH('PurchaseDate'), DAY('PurchaseDate'))+30

Sending PF (Function) Keys (CM)

ClarisWorks enables me to send function keys F1-F4 with the Keys menu or on my numeric keypad, but how can I send function keys greater than that, like PF5-PF24?

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.
ClarisWorks 2.0 comes with a VT320 Keys sample file which has shortcut buttons that provide a full function key set. You can modify this file for your use, or send the function key sequences manually with the following key sequences:

Press the Escape key, and then press a number key between 1 and 9, or the zero key for 10, hyphen for 11 and equal for 12. Press escape, then shift and a number key (or hyphen or equal) to generate function keys 13 through 24.

The same key sequences will work from ClarisWorks 1.0 Communications.

Smart Quotes Don‘t Work Correctly after Shift-Return (WP)

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
ClarisWorks 2.0 and ClarisImpact all allow you to create text with typographically correct quotation marks.

However, when using these curly "Smart" quotes in your text, if you use Shift-Return to enter a "soft return" (Shift-Return also creates a second line within an outline topic) and begin that second line with a quotation mark, you will incorrectly get closing smart quotes instead of opening smart quotes. Essentially, the "Smart" quotes get confused.

To get the correct quotation mark, add a blank space at the beginning of the line after the Shift-Return, type in the quotation mark, then delete that extra space.

Connecting to the Multiple Listing Service (MLS) With ClarisWorks (CM)

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.

Real Estate agents use an online service known as Multiple Listing Service (MLS) to download information about properties. An account must be created for each agent requesting access. A code will be issued for each account, and that will be the key to connecting to the service. Below are the settings needed in a ClarisWorks Communications document to properly connect to the service. This has been tested in the San Francisco Bay area, and may not be valid in other areas (the number you dial may need a different configuration than the following):

While in a Communications document, select Connection... from the Settings menu.
Enter the phone number of your service in the box next to Dial Phone Number
Baud Rate: 2400
Parity: Even
Data Bits: 7
Stop Bits: 1
Handshake: None

Next, select Terminal... from the Settings menu.
Emulation: VT100 or VT102 Tool
Check the Local Echo box
Enter the access code into the Answerback Message box (Sample: XXXX1234). Be sure your code is entered with all letters UPPERCASE.

You are then ready to select Open Connection from the Session menu.

NOTE: It is common to simply Capture Data as it scrolls onto the screen. This leaves property features listed with cryptic codes. Consult your manual for the commands needed to download a comma delimited file. Comma delimited data can be imported or pasted into a database. A database is a quick way to display property features as full words (Example: "SF:5,490" could be displayed as "5,490 Square Feet"; "HZ:9 VT:76" could read "Map Coordinates: Horizontal=9, Vertical=76")

Incorrect File Transfer of Quote and Apostrophes (CM)

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.

When transferring a file, particularly when using Text file transfer protocol, quote marks and apostrophes may be converted to other characters when received. These characters include R's, S's, and U's. This is due to the fact that when the document was originally created, the Smart Quotes option in the Preferences was on. Always turn the Smart Quotes option OFF when composing a document for transfer, if Text transfer protocol will be used, or if you are unsure if the software on the receiving system supports Smart Quotes.

AppleShare Network: How to Check for ProDOS Files

I have Apple IIGS systems and Apple IIe systems on an AppleShare 2.0.1 network. When the Apple IIGS starts up, it shows ProDOS 1.8 and GS/OS, yet when the Apple IIe systems start up, they show ProDOS 1.4.

I have an application (MECC Communikeys) that apparently doesn't work correctly with ProDOS 1.4. (One Apple IIe works OK, but the other Apple IIe systems lock the entire network.)

Where is ProDOS 1.4 coming from? I've checked for P* and P16 and even copied them from one folder to another.

This article has been archived and is no longer updated by Apple.
When setting up an AppleShare File Server for an Apple IIe and Apple IIGS environment, two copies of P8 are installed. One copy is installed when the server is updated with the Apple II Setup Disk for the AppleShare File Server (a Macintosh disk). This copy is placed in the Server Folder. Another copy is installed when GS/OS is loaded from an Apple IIGS using the GS/OS SYSTEM.DISK and SYSTEM.TOOLS (Apple IIGS disks). This copy is at the root level of the server.

It appears that an early version of the Apple II Setup Disk was used on the server. Earlier versions of that disk contained earlier versions of P8. Reinstalling the Apple II setup should provide the current version of ProDOS. Use the Apple II Setup Disk marked:

"Version 2.1; For use with Apple IIGS System Software 5.0".

How did you check for the ProDOS files? Was the check done from an Apple IIGS? Was the check done from a Macintosh on the network? Was checking done on the server from within the Admin application? Was the server restarted with a floppy disk and then checked for these files?

If the check was from a Apple IIGS workstation, the Server Folder is not visible. This is where one of the ProDOS files resides, and you would find only one of the ProDOS files.

If you checked from a Macintosh on the network, the result would be the same as when checking from an Apple IIGS workstation. There is no Server Folder available.

If checking was done on the server from within the Admin application, you will see the Server Folder, but you cannot open that folder and review its contents.

If the server was started up from a floppy disk and then the check was done, a second P8 file will be visible in the Server Folder.

System Freezing at the Splash Screen Spells Font Trouble

Troubleshooting corrupt font or fonts in Claris applications for the Macintosh

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.

Most Claris applications present a font menu with the fonts names appearing in their own typeface. Using this feature, you don't have to remember a font's name - this WYSIWYG Font Menu allows you to select fonts you have installed based on what they look like.

To create this special menu, Claris applications will create a picture of the font name, as it would appear in its own 12-point typeface. This picture is usually stored in a file in the Claris folder inside your System folder. This file is called Claris Fonts, ClarisWorks Fonts (for ClarisWorks 4.0), or FM Pro Fonts (for FileMaker Pro 3.0), depending on the applications and the versions you have.

It's handy the next time you use the program, so the image doesn't have to be recreated every time. Problems can occur when fonts become corrupt or when there are font ID number conflicts. Claris applications will have trouble using corrupt fonts to build this WYSIWYG font list at launch, which means the application will crash at the splash screen. Programs that offer an unenhanced Font menu do not encounter this problem.

Error messages that you might see include "Application has unexpectedly quit with an error of type 1", or "type 11" (on the Power Macintosh computers) or the Claris application may just freeze and not generate an error message (in this case, the freeze is the error message).

Here are several things to try, with the pros and cons of each.

Lock the Claris Fonts file inside the System Folder.

Actually, the file could appear in the System Folder, Claris folder, Preferences folder, or application folder. Locking the file will prevent the product from attempting to build a new one. After you lock the Claris Fonts file, you should be able to launch the application.

Advantages: It's fast. It's reliable. It is easy. It's a temporary fix.

Disadvantages: The Font menu no longer appears in the native typeface. The bad font is still there and may cause problems later.

Restart from a Disk Tools disk, which would have a factory-condition font setup.

Advantages: It's fast. It's easy. It's completely reliable.

Disadvantages: This solution cures only the symptoms of troublesome fonts. After using the Disk Tools disk, you still have to troubleshoot to find the bad font.

Remove the offending font(s) and install fresh ones from the System disks.

Advantages: Most of the time, this is a reliable fix.

Disadvantages: It takes time to locate the offending font. You can test each individual font or try relaunching the application with smaller sets of fonts installed.

There's a great article in the Tech Info Library which deals with this subject, titled "Crashing/ Hanging when Launching Application." Although it was written specifically for FileMaker Pro, it is useful for troubleshooting problems like this.

Claris applications for Windows also create font menus in their native typeface. This article is titled "Understanding The CLARIS.FNT Font File."

Equal Sided Polygon Tool Works Differently from Other Tools

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
The equal-sided polygon tool (stop sign) is the only tool that is preset to draw from the center rather than the edge.

This can be confusing, because no other tool automatically draws from the center.

All other tools require you to hold down the option key while drawing to get the same effect. The reasoning behind this choice is that the equal-sided polygon tool draws only symmetrical shapes, which are easier to draw from the center.

ClarisWorks: How the Alignment Controls Work

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
The Alignment controls in Claris products always give you four vertical options and four horizontal options for aligning selected objects:

Top to bottom:

Align Top Edges - Aligns the top edges of all of the selected objects with the object that is highest on the page.

Align Bottom Edges - Aligns the bottom edges of all of the selected objects with the object that is lowest on the page.

Align Centers calculates the vertical distance from the top of the topmost object to the bottom of the bottom object and aligns the centers of all of the selected objects at the midpoint of that distance.

Distribute Space calculates the vertical distance from the top of the topmost object to the bottom of the bottom object and evenly distributes he selected objects along that vertical distance.

Left to right:

Align Left Edges aligns the left edges of all of the selected objects with the object that is furthest left on the page.

Align Right Edges aligns the right edges of all of the selected objects with the object that is furthest right on the page.

Align Centers calculates the horizontal distance from the left of the leftmost object to the right of the rightmost object and aligns the centers of all of the selected objects at the midpoint of that distance.

Distribute Space calculates the horizontal distance from the left of the object furthest left to the right of the object furthest right and evenly distributes the selected objects along that horizontal distance.

ClarisImpact: Text Wrap and Drop Shadows

The Text Wrap feature ignores drop shadows and outline bullets.

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.

The Text Wrap feature ignores drop shadows and outline bullets. Text wrap allows you to wrap text around a graphic, but if you add a drop shadow to a graphic, or if you are working with outlines, wrapped text may overlap the drop shadow. In addition, Outline bullets do not wrap, although the outline text wraps normally.

1. Select your graphic and turn Text Wrap off.

2. Outline the boundaries of the graphic (including the drop shadow) with the polygon, bezigon, or freehand tool. (We recommend the polygon or bezigon tool.)

3. Choose Move to Back from the Arrange menu.

4. Set the fill to white and the pen to none.

5. Shift-click the graphic (so that both the graphic and the new object are selected) and choose Group from the Arrange menu.

6. Choose Text Wrap from the Options menu. Set the wrap to Irregular. Now ClarisImpact will wrap around both objects, and the wrap will take into account the drop shadow.

Now ClarisImpact will wrap around both objects, and the wrap will take into account the drop shadow.

Creating a Column of Sequential Numbers (SS)

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.

Here is a quick way to create a column of sequential numbers:
Type "1" in cell A1 and the formula "=A1+1" in cell A2 (both without the quotes). Then select cells A2 thru A10 (or whatever) and choose Fill Down from the Calculate menu (or type Command-D).

Creating a column of numbers followed by a period is tricky. Simply typing "1." will result in that cell being interpreted as a number (1.0) which equals 1, therefore the decimal is automatically stripped away.

To avoid this, type the following into cell A1(with the quotes): ="1."
Then type this formula (again, with the quotes) into cell A2: =A1+1&"."
Select cells A2 thru A10 and choose Fill Down.

Explanation:
The value of cell A1 is: 1. but the numeric value is 1. Because cell A2 is performing arithmetic functions, it takes the numeric value of cell A1 and adds 1 to it, resulting in 2. This result is then concatenated (combined) with the period.

Changing the Frame of a Paint Object Pasted into A Word Processing Document (PT,WP)

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.

Any time you paste a paint object into another environment, it will be pasted in with a surrounding frame. When you paste a paint object into a word processing document as an inline character it will have a frame around it. In line characters are not considered objects, and as such, can't have their fill or pen attributes changed.

The easiest way to work around this is to copy and paste the paint object into a drawing document first, change the pen pattern to transparent, and then copy and paste that element into the word processing environment.

Another method would be to paste the paint object on top of the word processing document by choosing the pointer tool from the status bar before pasting. Then change the pen pattern to white or transparent and then cut and paste the object into your document.

The above information also pertains to the limitation of changing the frame of any other object (ie - spreadsheet frame) once it is pasted into a word processing document as an inline character.

Error Message "Cannot Modify a Non-Modifiable Subscriber" (SS)

When I Publish some data from a ClarisWorks Spreadsheet or a ClarisImpact TabIe, I cannot change the font, style or size of the published numbers in the Subscribing Spreadsheet or Table. I get the message "Cannot modify a non-modifiable subscriber". Since ClarisWorks publishes with a generic font, how am I supposed to change the text attributes?

or

When I Publish formatted numbers (for example, currency or fixed) from one Spreadsheet or Table to another, the formatting is lost in the Subscribing document.

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.
Set the number format, font, style or size in the document before subscribing to the edition file.

NOTE: The above solution only needs to be used from Spreadsheet to Spreadsheet or Table to Table. For example, creating a Spreadsheet edition file and subscribing from a Word Processing file still allows modification of the Subscriber.

If you have further difficulties with formatting the data, please refer to the article "Text Formatting Difficulties With Publish and Subscribe" (article# 55659).

Many Ways to Select Records to Create a Found Set (DB)

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
Sometimes a found set is not easily assembled by using Match Records or Find. A found set is necessary when trying to print only some records, export only some records or print merge only some records. Being able to select multiple records in a variety of ways therefore becomes essential.

The Basics Regarding Selecting Records and Creating Found Sets:
The simplest way to select a record is just to click on a record. Two types of selections could occur. Either a field is selected or a record is selected. If a field is selected the outlines of the field boxes for the record you clicked on will appear and the specific field you clicked on will have a cursor blinking in it ready for keyboard entry. If you click on a record but not within a field the whole record will highlight.

Once you have succesfully highlighted a record, choose Hide Unselected from the Organize menu. Notice that all other records disappear and the status bar to the left of your records (just below the flip chart) indicates that only one record out of many are selected. Choose Show All Records from the Organize menu and all of your records will appear again. Now choose Hide Selected from the Organize menu and notice the record that was selected disappears. Take note of the status bar before choosing Show All Records.

Thus, you have created a found set of one record. Look to your User's Guide for more information regarding how to create a found set using Find and Match Records. This article only covers how to create a found set by selecting multiple records.

Advanced Techniques to Select Records and Make Found Sets:
Selecting multiple records falls into two categories: contiguous and non-contiguous. To select a set of contiguous records follow the steps below:

1. Highlight the first record you want in the set
2. Scroll down to the last record you want selected
3. Hold the Shift key down while clicking on the last record in the set
4. Choose Hide Selected or Hide Unselected from the Organize menu

Notice that all the records between the two records you clicked on are selected.

To select non-contiguous records follow the steps below:

1. Highlight the first record you want in the set
2. Use the flip chart to move to your next record
3. Hold the Command key down while clicking on the next record
4. Repeat steps 2 through 3 as many times as necessary
5. Choose Hide Selected or Hide Unselected from the Organize menu

Notice that only the records you clicked on are selected this time.

A really easy approach to putting non-contiguous records into a found set (but possibly more time consuming) is to highlight a record and choose Hide Selected Records from the Organize menu. You can repeat these steps as many times as necessary until you have assembled your found set. Only performing a Find or choosing Show All Records will disrupt what you have put into a found set.

Since Match Records only highlights records and does not hide the unselected, it is possible to combine the techniques outlined above with Match Records to more easily assemble a found set.

Text Formatting Difficulties With Publish and Subscribe

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.

If you Subscribe from a ClarisWorks 2.0 (or higher) Spreadsheet or ClarisImpact Table Publisher without first formatting the cell, the published data will come in with no formatting. For example, if your published data is formatted as currency, and you don't select the subscribing cells and format them as currency BEFORE subscribing, you will just get the data (1 for $1.00, etc.)

This is actually normal. The same thing happens if you simply copy and paste data from a ClarisWorks Spreadsheet document to a ClarisWorks Word Processing document (as opposed to into a Spreadsheet frame, which can be formatted). Refer to the Tech Info article entitled "Pasting Number-Formatted Data from SS to WP" for a full explanation.

Possible Symptom:
If you format the cells in the subscribing document and then subscribe, you will notice that all but the first cell will come in with the proper formatting.

Suggested workaround:
In the publishing document, include a blank cell as the first cell in the published data.

Another Possible Issue:
If you modify the data in the publishing spreadsheet and then save, the subscriber is updated but loses all formatting. There is no workaround for this at this time.

DAL and VAX: Async Connection Issue

I am evaluating Data Access Language (DAL, formerly known as "CL/1"). I set up an asynchronous connection (through a modem) to a VAX with Red Ryder with these settings:

1200 baud
No parity
8 data bits
1 stop bits
XON/XOFF

I connect to another VAX using DECnet with a "c MIS001". This is the VAX with the DAL server running. Leaving the terminal session open and using the DAL test application, I invoke this host connection script direct1200:

direct1200:async:com1:1200:Noparity:8databits:1stopbits:Bothxonxoff:128:Nomodem

This returns a "connection failed", error 10628(0) asynch() with no message.

I tried using the async1 host:

async1:async:com1:1200:Noparity:8databits:1stopbits:BXonxoff:128:Modem:Tone::se
cs:attempts

This returns a "Connection to host async failed", error 10643(0) async() with no message.

Then it returns a "connection failed", error 10628(0) async() with no message.

I think this is because of the round-about connection to the host, but it seems if I already made the connection, the DAL tester should piggyback on the connection. I verified that the AppleTalk connection works and can access data this way. Therefore, it does not seem to be a server-based problem.

1) What script should I use for this type of connection?

2) How easy would it be to write a host script, so I don't have make the connection through Red Ryder?
This article has been archived and is no longer updated by Apple.
We talked with Network Innovations, and they stated that their asynchronous protocols work only with VAX systems directly connected to the asynchronous link (in this case, the modem). In other words, they do not support logging on to one host, connecting to a second host via DECnet, and running the DAL server from that second host. They are aware of this issue and are looking at ways to resolve it in the future, but there is no workaround at the present time.

ClarisImpact: Creating and Saving Model Styles

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
To create a model that can be saved as a Model Style, you must:

1. (Optional) If necessary, go to Element Styles and create elements that will be used in the model
2. (Optional) If necessary, go to the appropriate options to create or modify objects/formats that will be used in the model: Connector Settings, Level Settings, Frame Spacing, Spacing, and Sizing.
3. Create your model using any of the following options to modify the model: ElementStyles, Connector Settings, Level Settings, Frame Spacing, Spacing, or Sizing.

Note: If you do not use Element Styles, Connector Settings, Level Settings, Frame Spacing, Spacing, and Sizing to create and modify objects, some object formats may be stripped out of the model when it is added as a Model Style. For example, if you change the color of task boxes in an Org Chart from white to blue, by using the color palette, when you save the Org Chart as a Model Style, the task boxes will be white. The blue task boxes will be stripped out because you did not use the Element Styles dialog to create or apply the blue work boxes.

To add a Model Style:

After having created a model you would like to use again:

1. Select the model
2. Select Model Styles from the Model Menu
3. Click the Add button. This will create a Model Style named Style X, where X is a number.

You may get a dialog warning you that some formats may be stripped.

NOTE: If the model does not look correct in the sample, you will have to go back to either the Element Settings to create or apply an element, or you may have to go to one of the other settings, spacing, or sizing options to apply a format option correctly.

ClarisImpact: Editing Element Styles

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.

Element Styles control the settings for individual parts of a model. They define styles for boxes, connectors, etc. Element styles work differently and control different settings in each type of model. The Element Styles are stored in either the ClarisImpact Color Styles or ClarisImpact B&W Styles folder.

There are two methods for editing Element Styles. The first method is used when editing Element Styles for either the Calendar, Organization Chart, or Outline.

When editing these Element Styles, you use the Style Editor window. In this window, you use tools and various menu items to edit elements of the selected style. You can use various palettes to change element colors, sizes, etc.

The second method is used when editing Tables, Data charts, and Timelines. In these models, you edit Element Styles through the Element dialog.

Flow Charts use symbols, and do not have Element Styles.

Published Date: Feb 18, 2012

ClarisImpact: Flow Chart Model Styles Apply only to Connectors

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.

Flow Chart Model Styles can only be applied to connectors between symbols, not to the symbols themselves. So, when you create a Model Style for a Flow Chart, it will show you the symbol(s) that were used in that chart. However, if you see a Flow Chart with triangles and you want to apply those triangles to the current chart, you cannot do it with the Apply button in the Model Styles dialog.

To change the symbol type for a particular Flow chart or separate objects in that Flow Chart you must do the following steps:

(1) Go to the chart level
(2) Select the objects for which you want to apply the symbol
(3) Select Symbol from the Flow Chart Menu
(4) Select the symbol you wish to apply
(5) Click the Apply Button

ClarisImpact: Format Options are Ignored when Saving Organization Chart Model Styles

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.

1. If you click on a box or any other object of the Organization Chart and make a format change to that object by using one of the palettes (such as the color or pattern palettes), you cannot save these format changes in a Model Style. This is because you made changes directly to the model and did not apply existing elements to that model. ClarisImpact references the Elements Styles library to create models. If you do not use existing Element Styles to create a model, changes you have to the model will be ignored.

Solution: From the OrgChart menu, use Element Styles, Connector Settings, Level Settings and Frame Spacing to modify an Org Chart.

2. Because Organization Charts are level-based, in order to save a model style, each level must have the same Element Styles applied to that level. For example, if you have 2 blue worker boxes at a level 2 and you use the Element Styles dialog to change 1 worker box to yellow, when you try to save this as a Model Style, that level will revert to a default setting. Similarly, if you change individual workers or connectors, then try to add an Org Chart as a Model Style, a dialog box may warn you that it cannot add the modifications. If all workers or connectors are not the same at a given level, ClarisImpact will ignore the applied format options.

Solution: Make sure that all the workers on each level are the same.

ClarisImpact: Possible Confusion when Naming/Creating a Model Style

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.

You cannot add a Model Style with a specific name. You must first add the Model Style with the default style name (Style X, where X is a number), type the new name for the Model Style while that style is selected, and click the Rename button.

EXAMPLE: You create an Org Chart that has oval task boxes. You wish to save this as a Model Style. You go to the OrgChart menu item and select the Model Styles item, type "Oval" as the name, click the Add button and expect to create a new Model Style called "Oval". ClarisImpact will remove the word "Oval" from the Name line and replace it with "Style 2" and add a style called "Style 2". This interface can be very confusing.

The name that is typed into the name bar refers to the selected Model Style. Thus, if you click the Rename button, it will rename the selected style. However, if you click Add, it will add a new style based on the style that is selected in the document. Thus, the name of the style will revert to a default name.

ClarisImpact: Master Slide Styles

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
Master Slide Styles are similar to the Model Styles. Master Slide styles are used with presentations. Unlike Element Styles and Model Style options, Master Slide Style options are accessed through the View menu.

Master Slide styles store all formatting settings:
- background fill and graphic elements
- placement and size of title and body place holder
- font, font size, text settings
- Level Settings for the outline model in the body place holder
- slide size (document size or output medium)

(See page 14-18 of the manual for a complete list)

Publishing may Make Some Graphics that are Not Selected, Publish Anyway

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
Publish and Subscribe works differently in ClarisWorks and ClarisImpact than it does in MacDraw Pro.

All of these programs allow you to select any object or objects from a document and publish them. However, ClarisWorks and ClarisImpact publish everything inside the rectangular Publisher boundaries. MacDraw Pro works differently in that it only publishes the selected items regardless of the proximity of other objects in the document.

Therefore, anything that is close enough to the selected objects to fall within the boundaries of the Publisher will be included in the edition file.

ClarisImpact & ClarisWorks: How to Insert Inline Graphics

How to integrate pictures or other objects into your body text.

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.

Both the ClarisWorks Word Processing Environment and the ClarisImpact Report Environment allow you to paste graphics in-line (so the graphic flows with the text). However, the procedure is slightly different in each application.

In ClarisWorks 2.0:

Make sure the Text Tool is selected in the Tool Bar by choosing Show Tools from the View menu. Now you can use Copy and Paste or Insert to place the inline graphic.

To paste a graphic on the Drawing Layer (so that it does not flow with the text, but does allow you use the Text Wrap feature), click on the Arrow tool in the toolbar before Copying and Pasting or Inserting a graphic.

ClarisImpact:

To add an inline graphic, hold down the Option key while selecting Paste under the Edit menu, or use the keyboard equivalent Option-Command-V. This is described in the User's Guide on page 13-69.

If you do not hold down the Option key while Pasting, ClarisImpact will automatically paste the graphic on the Drawing layer so that you can use the Text Wrap feature.

Using Place File to insert a graphic in ClarisImpact is a two-step process, because Place File... always inserts graphics on the Drawing layer. Use Place File... to insert the graphic, select it with the arrow tool, Cut and then Option-Paste at the desired location.

TA42633_HighSpeed_Printer_Solutions_for_the_Macintosh_(TIL05569).pdf

High-Speed Printer Solutions for the Macintosh

A customer needs a high-speed printer setup for a Macintosh SE or Macintosh IIcx to print labels in volume. The quality of print does not matter--Draft mode and readable is all that is needed. The ImageWriter II that is being used now takes 6 to 7 hours to print the current list, and this list will quadruple next month. Are there any dot-matrix connections to high-speed printers that truly take advantage of the printer's speed? Epson's package can only go as fast as the converter.

This article has been archived and is no longer updated by Apple.
The majority of high-speed printers are line printers, not dot-matrix. Support Engineering uses a Printronix Model 300XG Line Printer with a Centronics parallel interface. The product used to connect it to the Macintosh is no longer available, but searching the "Buyer's Guide" on AppleLink with "parallel and serial and printer" as criteria, we found references to a number of products to connect high-speed parallel printers.

Among the products found were:

- Grappler C/Mac/GS from Orange Micro

- ParaLink from Jonathon Freeman Technologies, Inc.

- Macintosh Port Adaptor from Cambridge Automation, Inc.

Claris Impact: Replace Clones does not Work as Expected

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
Replace Clones may not work properly if two different Libraries have objects with the same name. For example:

1. Open the Animals Library
2. Add the "Cow" object to the document
3. Create a Circle
4. Create a new Library and add the Circle to the Library
5. Rename the circle to have the name "Cow"
6. Add the new "Cow" object to the document

Try using Replace Clones now. You should notice that Replace Clones identifies objects by name and will replace any object named "Cow". If you are using more than two Libraries and each Library has an object with the name "Cow" then you may find that Claris Impact will disregard some of the Cows when using Replace Clones.

Workaround:
Do not use the same name for different objects.

Claris Impact: Using Library Clip Art with Calendars

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
Clip art from a Claris Impact library cannot be placed directly into a Calendar created in Claris Impact. However, you can place that clip art into an Element Style and apply that style to a day or a series of days in the Calendar.

To place clip art from a library into a Calendar, perform the following steps:

1. Select the day or series of days to which you wish to add the art.
2. Choose Element Styles from the Calendar menu.
3. Click New to create a new element style.
4. Click on the Library icon to open a library.
5. Place the library object in your Element Style.
6. Click Ok.
7. Click Apply to assign the Element Style to the selected calendar days.

Of course, you can always quickly add graphics to your documents with Libraries. You just cannot place them as a part of a Calendar frame without performing these steps.

Exporting Using "Format Output" Option Doesn‘t Include Text Styles

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
When exporting to a text file, the Specify Field Order for Layout dialog has an option called "Format Output Using the Current Layout". This option does not support exporting any text attributes, including style, size or font. Text style attributes include case (Upper, Lower, Title), bold, italic, small caps, and so forth.

Thus, no formatting options can be exported from text fields. Case attributes can be exported by defining a calculation field, then exporting the calculation field. For example, to export a field in Title case, define a calculation field with this formula:
Proper (Textfield).

In the case of number, date and time fields, the options supported for export include the options in the Number Format, Date Format and Time Format dialog boxes. For example, you can export a number field with $, % or a fixed number of decimal places. You can export a date field with the date spelled out using any format that can be displayed on the layout (e.g., December 31, 1994). You can export a time field with the time spelled out using any format that can be displayed on the layout (e.g., 8:31pm).

ClarisWorks: Choosing Function Key When Recording a Macro and Apple Adjustable Keyboards

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
When recording a macro in ClarisWorks, the Record Macro dialog gives you an option of assigning a function key to invoke or play the macro later. Normally, when you select the Function Key radio button, a box highlights showing the next available function key in black.

Because the Apple Adjustable Keyboards function keys are actually on a separate keypad, ClarisWorks doesn't see them in the same way it sees them on an Apple Extended Keyboard. When using the Adjustable Keyboard, ClarisWorks will show the appropriate function key, but it will be gray. It will still work though - meaning depressing the grayed out function key after recording the macro will play that macro.

This is only an issue if you are using ClarisWorks 2.0 and System 7.1 - it is fixed in ClarisWorks 2.1 or later, and in later versions of the system software. If you are using System 7.1, you can correct this by installing the System Update 3.0 (which updates you to System 7.1.2), it will then show the function key in black in the Record Macro dialog.

ClarisWorks SS: Decreasing Rows and Columns in the Document Error Message

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.

To remove cells in a ClarisWorks spreadsheet, simply choose Document... in the Format menu, and type the appropriate number of columns across and/or rows down before clicking OK.

Should this action result in an error message "The selected value must be in the range x to x", it is because ClarisWorks thinks there is data in one or more of the cells you are attempting to remove. Sometimes this is an invisible formatting character which can't be seen on screen.

To resolve the problem, drag-select through the cells you are attempting to remove and choose Clear in the Edit menu.

ClarisImpact Product Information (short version)

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
ClarisImpact is a brand-new application from Claris that dramatically simplifies the creation of top-quality business graphics . Choose from professionally-designed templates to automatically create organization charts, timelines, flow charts, data charts, calendars and more. Place AND edit these "smart" graphics directly in printed reports and slide shows using Impact's integrated word processing and presentation capabilities. ClarisImpact includes everything you need to create high-impact business graphics, all in one easy-to-use application.

- $399 suggested retail price (SRP) in the U.S.
- Currently registered owners of MacDraw Pro can purchase ClarisImpact for Macintosh for $99, or choose ClarisDraw for $99 (SRP).
- Registered owners of MacDraw II, ClarisWorks, or comparable competitive graphics applications can purchase either ClarisDraw or ClarisImpact for $149 (SRP).
- Customers who purchased MacDraw Pro after June 1, 1993 can purchase ClarisImpact for Macintosh for a special price of $49, or upgrade to ClarisDraw for Macintosh for a special price of $29 (SRP).

See article "ClarisImpact SRP and Upgrade Options" and "Product Fact Sheet, ClarisImpact 1.0 for Macintosh" for more detailed information.

ClarisWorks: Fill Down, Fill Right Commands

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.

If you've written a formula that calculates cells in one row and you'd like to apply that formula for additional rows without manually pasting it for each cell, click into the cell with the formula, drag to highlight cells downward and choose Fill Down from the Calculate menu. Alternatively, you can drag to the right and select Fill Right from the Calculate menu. Cell references in the formula will be incremented by 1 automatically unless you indicate an absolute reference by preceding the cell reference with a $ symbol, e.g. A1.

The Fill commands also work for entering data (not just formulas) you want to repeat through a range of cells.

This is covered in Page 6-11 of the ClarisWorks 2.x User's Guide, Page 5-12 of the ClarisWorks 2.x Getting Started manual, and in the Online Help (look for "Cells: filling automatically" in the index.)

ClarisWorks: Importing Gif Files into ClarisWorks (DR, All)

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
When importing gif files into ClarisWorks that were translated onto the Mac using Apple File Exchange, they will not be recognized as GIF files by ClarisWorks. This is because Macintosh files have a Type and Creator identifier, but files from other platforms don't have them.

The work around for this is to use a program such as Drop Info, ResEdit, File Typer, or Get More Info to change the file type descriptor To GIF. Once this is done, ClarisWorks will recognize the file as a gif file.

ClarisWorks: Splitting (or Creating) a Subset Database (DB)

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
The ClarisWorks database environment allows you to easily create subset databases from a master database. This can be useful if you want to create a fully-functional copy of your database that only has records for people who are working for a specific company, or for everybody who has responded to an invitation.

Here are two methods for creating a subset database from a master one. It should be noted that the method used for isolating the subset of records is important. For clarification of these methods (find, match, select) please refer to the article "Many Ways to Select Records to Create a Found Set (DB)"

Method One:
1. Make a copy of your current database (within the database choose File, Save As, or within the Finder you can duplicate the file).
2. Open the copy of the database
3. Choose Organize menu, Show all records
4. Match the desired records or manually select using the shift and Command keys (Using Match or Select will highlight the selected set)
5. Choose Organize menu, Hide selected (This will leave you with the records you want to remove visible)
6. Under the Edit menu, choose Select All
7. Choose Edit menu, Clear
8. Show all records in the Organize menu
9. Save the database
You now have saved the edited version and the original is still intact

Method Two:
It should be noted that this method uses the File menu "Insert" command which is a feature added to ClarisWorks 2.0 (It's not available in version 1.0 for Macintosh or Windows)

Perform the following steps:

1. Open your current database. We'll assume that it is called "Mailing List."
2. Use the Layout menu, Find command to create a "found set" of records. (This automatically hides the records you don't want to save)
3. Use the Save As... command in the File menu to save a DIF file on disk. Let's call it "Mailing List.DIF" so that you can recognize it easily. (This saves just the data into a text file)
4. Use the Save As... command in the File menu to save a copy of the current database on disk. Call that file "Mailing List Copy" so that you can recognize it easily.
5. Choose Open from the File menu and open "Mailing List Copy".
6. Choose Organize menu, Show All Records, then Edit menu, Select All
7. Choose Clear from the Edit menu. (This will empty "Mailing List Copy" so that we can bring new records into it.)
8. Choose the Insert command from the File menu, and specify the "Mailing List.DIF" file for import.
9. In the Import Matching dialog, all of the field names on the right will match the first import record on the left. Just click OK.
10. Use the Save command to save the newly-imported records.

You're done! Now, you've got your original file with all of its records, and you've got a second file called "Mailing List Copy" that has only the records that you wanted.

ClarisWorks: Improving WYSIWYG Results With Adobe Type Manager

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.

What you see on screen should, ideally, look exactly the same as what is printed. Unfortunately, screen display never perfectly matches printed output because monitors have lower resolution than printers. With fewer pixels available to represent a character of a given size, the screen display generally deviates to some degree from the printed output. Windows application use either 72 or 96 pixels on screen for each inch of paper displayed. Most Laser printers print at 300 pixels per inch of paper. The limitation of matching screen display and printout is caused by roundoff errors in converting the number of pixels used for the text onscreen to the number of pixels used for the text on printout.

When using Adobe Type Manager with a PCL printer such as an HP Laserjet, checking the "Use Pre-built or Resident Fonts" check box in the ATM control panel lets the printer driver use fonts resident on the printer itself at print time. However, screen and printer fonts are separate and do not match as well as a scaled font such as an ATM font or a True Type font. When you clear the Use Pre-built or Resident Fonts check box, your text and graphic images will print as displayed on-screen.

Full justified text set to a small point size sometimes extends beyond the right margin on screen, but prints correctly. The screen font Windows has picked is a different size, and turning off the Use Pre-built or Resident Fonts option in the ATM Control Panel can help improve the match between screen display and printed output.

ClarisDraw, Impact: Workaround to Apply Kerning and Tracking

Simulate typesetting basics like kerning and tracking in ClarisDraw and ClarisImpact by using the Bind Text (in ClarisDraw) and SmartAlign features.

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.

Tracking and kerning in ClarisDraw and ClarisImpact

Although ClarisDraw and ClarisImpact do not support a tracking (character or letter spacing) or kerning (custom adjustment of space between individual pairs of letters) feature, it is possible to achieve the same effect for your text. Here's how to do it.

Tracking

In ClarisDraw, you can use the Bind Text feature to simulate text tracking:

1. Create a straight horizontal line the length of your text block.
2. Select the text block and the line.
3. Choose Bind Text from the Text menu.
4. Select transparent from the Pen Pattern palette (the first choice in the Pattern Palette is "transparent") to make the line invisible.
5. Choose Bind Text Options... from the Text menu.
6. Increase the Tracking percentage to make the spacing between letters greater. Decrease the Tracking percentage to make the spacing between letters tighter.

Tip: Use the above technique for titles, where larger point sizes (roughly 18 point and above) create the optical illusion of more space between the individual characters.

Kerning

In both ClarisDraw and ClarisImpact, you can use the SmartAlign feature to create relationships that can simulate kerning:

1. Create each letter in each word as a separate object. (If you wish to kern only the characters within a single word, create each letter of that word as a separate object.)
2. Select all of the separate objects and use the Alignment command to Create an "align bottoms and distribute space" relationship.
3. Click on the last letter of the text and use the arrow keys to kern the whole word or sentence (remember to turn Autogrid off).

Also see article, "How to Kern Headlines".

Macintosh Portable: Does Not Support SCSI Disk Mode (3/95)

Can I connect the Macintosh Portable to another Macintosh via the SCSI port?

This article has been archived and is no longer updated by Apple.
No, the Macintosh Portable does not support SCSI Disk Mode as is supported on most PowerBook computers.

For many reasons, you should not connect two Macintosh computers via SCSI cables, with the exception of PowerBook computers which support SCSI Disk Mode. This includes all PowerBook models except for the PowerBook 140, 145, 145B, 150, and 170.

The most important reason is that you would then have two devices (the computers, and often the internal drive) on the bus with the same SCSI ID. Further, a straight-through cable would connect outputs to outputs and inputs to inputs, which would bring communications to a halt.

Article Change History:
16 Mar 1995 - Updated list of computers which support SCSI Disk Mode.

Differences Between Type 1 and Type 3 Fonts

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.

Type 1

Type 1 fonts are outline fonts based on the Postscript language. Type 1 fonts are programmed according to the outline font format introduced by Adobe, and the Type 1 format is an open industry standard. Most Postscript printers contain a number of Type 1 fonts in ROM, and additional fonts can be downloaded. Type 1 fonts are more compact than Type 3 fonts, and the Type 1 font is the only font format ATM can rasterize.

Type 1 fonts are both encrypted and hinted. Encryption is the process used to protect font information (hints and character data) from inspection or modification. The encryption key has been published in the Adobe Type 1 Font Format book but is still useful for discouraging casual theft. Hinting consists of information added to an outline font greatly aid in better screen display at small point sizes (when using ATM) or when printing to low resolution Postscript devices or to non-PostScript devices. Hinting helps control vertical alignment, consistent stem widths, filling-in of counters, and discontinuities in thin strokes.

Type 1 fonts are multi-platform capable (Macintosh, PC, Unix) and more compact than Type 3 or TrueType fonts. They are easier to develop than TrueType fonts and their quality is more consistent. However, most differences between Type 1 and TrueType fonts are transparent to the user. The hand-tuned bitmaps for Windows TrueType fonts look better on screen than the bitmaps ATM creates.

Type 1 fonts are packaged in platform-specific formats (Macintosh, PC, Unix). The printer driver or downloader converts these platform-specific outlines into a device independent format expected by a Postscript printer and specified in the Type I Font Format book. This means a Type 1 font can be downloaded to any Postscript printer and be used by any Postscript file coming from a variety of platforms.

Type 3

Type 3 is an outline font format introduced by Adobe. The Type 3 format is also a Postscript program but unlike the Type 1 format Type 3 fonts do not contain hints. Type 3 fonts are also called "user-defined fonts," and are useful for describing complex graphic shapes, such as a logo. Type 3 fonts, like Type 1 fonts, may be a normal text face or a symbolic font. Unlike Type 1 fonts, the character descriptions for a Type 3 font can potentially use any graphic operator in the Postscript language. Because of this flexibility, the two most common uses of Type 3 fonts are for logos (symbolic) and for bitmap fonts where each character description is a small bitmap (more specifically, an image mask). For example, Microsoft's Windows 3.1 Postscript driver converts TrueType fonts into Type 3 bitmap fonts for printing to Postscript printers. Type 3 fonts are Postscript fonts which do not work with ATM because they allow use of the full Postscript language and ATM is not a full Postscript interpreter. They are not hinted and can exist in bitmap or outline form. They are useful for complex or ornamental fonts or logos. The Faux fonts made by Super ATM are Type 3 fonts.

Other Types

All Postscript fonts, whatever the type, contain the same basic data for describing character shapes. The different types are justdifferent ways of encoding the font for various systems.

Type 0 - Composite, or Kanji fonts. They can handle much larger character sets than Type 1.
Type 1 - Encoded in ASCII, and can be shared across a network.
Type 4 - Encoded in binary format for use on display postscript systems.
Type 5 - These fonts are ROM-based.
Type 6 - These are cartridge based fonts.

Special Characters

Although the Postscript language implements an ASCII character encoding scheme by default, this is changeable. Every font has an array called the Encoding array that maps character codes to names of procedures that draw the characters. It is possible to change this array in order to implement a different encoding system. Getting at unencoded characters is another reason to modify the encoding vector. Many Postscript fonts contain unencoded characters. These characters exist in the font, but by default are not placed in the Encoding array. Older printers containing version I Adobe fonts were delivered with a default "Standard Encoding" that is a subset of the ISO Latin I character set, and were missing characters we currently included see ROM font supplements. All downloadable Adobe fonts, and most ROM fonts depending on their date, are now complete.

CLARIS SWEEPS DATABASE, INTEGRATED AND GRAPHICS SOFTWARE CATEGORIES IN MACLIFE GRAND PRIX Ô94

Claris Macintosh software ranks number one in Japan

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.
SANTA CLARA, Calif., -- February 3, 1994 -- Japanese versions of FileMaker Pro, ClarisWorks and MacDraw Pro software from Claris Corporation have won first-place honors in the MacLife Grand Prix '94. MacLife is one of the most influential monthly computer trade magazines published in Japan.

MacLife editors nominated products in twenty-five software categories including integrated software, graphics, database and others. The MacLife Grand Prix '94 winners were selected exclusively by reader's choice. FileMaker Pro,ClarisWorks and MacDraw Pro, the best-selling Macintosh products in their categories, were each named winners.

"The MacLife Grand Prix recognition is an important honor for Claris," said Daniel L. Eilers,Claris president and chief executive officer. "Hit products have fueled remarkable growth for Claris in Japan, as our revenue almost tripled in 1993."

Japan, where Macintosh business is expanding dramatically, ranks number two following the United States for sales of Macintosh systems. Claris Japan is committed to supporting this growing market and continues to provide Japanese Macintosh users with powerful, truly usable software solutions.

Claris products won 55 first-place awards from computer publications worldwide in its fiscal year 1993. Thanks to this steady stream of hit products, customers are rewarding Claris with great growth. Claris entered the ranks of the 10 largest personal computer applications vendors in 1993, growing by 48 percent with revenues for FY93 of $154.4 million - the highest growth rate of any of the top-ten vendors.

Claris Corporation, a leading worldwide vendor of Macintosh and Windows applications for business, education and home, is a subsidiary of Apple Computer, Inc., with headquarters in Santa Clara, Calif.

ClarisWorks: New ZModem Tool for Communication Environment (CM)

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.

One of the most frequently asked of frequently asked questions on the Macintosh Internet discussion groups has been, "Is there a freeware or shareware ZMODEM tool for Communications Toolbox (CTB) programs?" Until very recently, the answer was always "No, and there aren't really any common commercial ones either." Aladdin solved the commercial conundrum by including one with their popular new program, SITcomm, and DCA's CrossTalk for Macintosh also includes one. But now, thanks to Mark/Space Softworks there is a free ZMODEM tool on the nets.

The tool (which lives in your Extensions folder) works with numerous CTB programs such as the communications modules in ClarisWorks, GreatWorks, and Microsoft Works, Synergy's powerful VersaTerm, and Tim Endres's free Termy. It supports auto receive, picks up interrupted transfers in the middle, supports batch transfers, works over telnet connections and serial connections using software flow control, and includes full status information.

The catch? "There must be a catch," you say. You're right. The free version of the ZMODEM tool is actually a demo for the $29.95 commercial version, but the difference between the two is that the free demo version supports only downloading. Thus, if you're like most people and mostly or only download files, the demo will serve your needs. And of course, you can order the full version with the order form included with the demo should you wish to take advantage of the speed and features of ZMODEM when uploading.

ClarisWorks: Performa Clip Art Collection Tip

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.

If you open up any of the "Performa Clip Art Collection" files directly, it will open itself into the Drawing (Graphic) environment. This makes it difficult to work with if the document contains more than one image. (These images cannot be Ungrouped even though the Ungroup Picture command is available under the Arrange menu.)

A better option for these multiple image files:
Note: The full color Painting environment in ClarisWorks can demand a large amount of RAM - Increase ClarisWorks RAM memory allocation as high as possible before attempting these steps (see the Installation Guide, page 12)

1- Open the (multiple image) clip art document.
2- Under the File menu, select Save As.
3 - Pop down the Save As menu and select PICT format.
4 - Type in a name, and click Save.
5- Under the File menu, select Open and Pop Down the Document Type menu to select Painting.
(If the available memory needs to be set higher, only part of the document may open.)
6 - Select and Open the PICT file you just saved.

Now you will be able to select any part of the artwork with the lasso tool, Copy it, and Paste it into your own document.

ClarisWorks: Instructional Books for Teachers and Classrooms

ClarisWorks Training resources for Educators
This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.

ClarisWorks in the Classroom
(1/1/97 - No longer available from Claris - Available from CWUG (313) 665-8991)
Claris Corporation
This collection of 25 lesson plans covers language arts, social studies, mathematics, and science, integrating computers into the curriculum. Developed by the North York (Ontario) Board of Education and published by Claris Corporation, it offers hands-on active learning experiences using concepts and skills that cross disciplines. Included is a disk with files the students use for their work.

ClarisWorks for Teachers
(1/1/97 - no longer available from Claris - will be available from 3rd party)
Claris Corporation
Made especially for Teachers, this 208-page tutorial contains six well-designed, concise lessons that teach you how to manage classroom tasks with ClarisWorks. The step-by-step lessons show you how to prepare letters to parents, produce school newsletters, develop grade books, maintain student records, and develop a presentation with ClarisWorks. Published by Claris Corporation.

Essentials of ClarisWorks
Jan Harrington
This 270-page student textbook and associated ClarisWorks data disk is part of the series of popular "Essentials of..." books published by Course Technology. "Essentials of ClarisWorks" includes an introduction to Macintosh computing and step-by-step instructions that describe how to use the ClarisWorks environments. Each chapter concludes with a series of exercises where you practice the skills you just learned. Cost is $29. Amy Oliver, Course Technology, Inc., 1 Main Street, Cambridge, MA 02142; (800) 648-7450; Fax: (617) 225-7976.

Hands-On ClarisWorks
Arthur Leuhrmann and Herb Peckham
This 496-page textbook is designed for a half-year course in grades seven and above on word processing, databases, spreadsheets, graphics, and communications using ClarisWorks. The Hands-On ClarisWorks package includes the textbook, a data disk with dozens of sample files and templates referenced in the book, a 96-page teacher's guide, and a set of reproduction masters. Cost is $34.95. C¥WUG special price, $29.95. A sub-set of Hands-On ClarisWorks entitled "ClarisWorks Word Processing" is also available for $29.95. Teachers can examine either set for 30 days without obligation. Then you either pay for or return the sample materials. Computer Literacy Press, 5750H Obata Way, Gilroy, CA 95020; (800) 225-5413; Fax: (408) 848-1483.

ClarisWorks: How Postscript Fonts Work

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
PC Fonts consists of three files:
.AFM - Adobe Font Metric
.PFB - Printer Font Binary
.INF - Font Information

Windows Screen fonts consists of:
.PFM - Printer Font Metrics - contains only metric information.
FON - Windows bitmap screen fonts and metrics information.
* Postscript printers and HP PCL printer require .PFM files.
Windows screen fonts are 96 dpi at standard VGA 640x480 resolution.

Mac Fonts consists of three files:
Adobe Font Metrics,
Bitmaps screen fonts,
and Outlines files.

Mac screen font:
Contain bitmap font
and metrics font.
Macintosh bitmaps are 72 dpi.

Font Parts

Bitmap font (Screen Fonts) - A pattern of dots (bits) that closely resembles a character shape in a given typeface, point size, rotation and resolution. Bitmapped characters used as screen fonts tend to be jagged, as opposed to smooth characters generated from outlines. Bitmaps cannot be scaled without distortion and require consider-able storage space. They provide screen pictures to your applications of what certain fonts look like at specific sizes.

On the Macintosh, when applications are launched, they read the system for installed bitmaps and then build the font menu from this information. These bitmap fonts can be installed in the system file, with a font utility, or if using System 7.1, in the Fonts folder. If you ever need to use a font size in your application different from those sizes installed, then the operating system will scale the nearest bitmap size to approximate the requested size on screen unless you have ATM. Bitmapped fonts for both System 6 and System 7 have numbers appended to the ends of their names. Numbers correlate with the bitmap sizes contained in the bitmap file. For example, the "Adobe Garamond Bold 18" file describes the appearance of all characters in the Adobe Garamond Bold typeface when displayed at 18 point size. Bitmaps of many sizes and styles are usually grouped together within a single suitcase file. Under System 6, the contents of suitcase files may be examined with the Font/DA version 3.8 or later. Under System 7, double-clicking on a suitcase file will open the file and display the bitmaps, just as if the suitcase file were a folder.

Outline font-A method of describing the shapes of the characters in a typeface by a program. This mathematical representation of lines and curves is resolution-independent and device-independent.

Outline fonts (Printer fonts) contain mathematical descriptions of each character in a typeface's character set. This description applies to all sizes. All Adobe Postscript out-line fonts have the slanted A icon with horizontal lines in the background. Postscript printers have the ability to scale outline fonts to produce high quality, high resolution output. With ATM installed, outline fonts make it possible to display all sizes of text at maximum screen resolution, as if bitmaps for all possible sizes were available.

ClarisWorks: Modem Types Reduced in Apple Modem Tool 1.5 (CM)

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
With the release of Apple Modem Tool 1.5, Apple decided to discontinue built-in initialization strings for modems made by other manufacturers, due to support issues. You can add a custom initialization string by following these directions:

1. Select Connection from the Settings menu.

2. Select your modem type from the modem popup menu if it is listed. Otherwise, look for your modem in the list or recommended initialization strings below and specify the corresponding string by choosing Custom from the popup menu and entering it. (If you do not see a Custom item, hold down the option key before clicking on the menu. You have an earlier version of the Apple Modem Tool and should obtain the ClarisWorks 1.0v4 updater or purchase the ClarisWorks 2.1 upgrade.)

3. If you didn't find your modem in the list below, you can either call your modem manufacturer to ask them what string to use, or select the Hayes-compatible option in the Apple Modem Tool dialog.

TIP: If you want all new communications documents to default to using the new initialization string you set, select Save As, title your document "ClarisWorks CM Options", select ClarisWorks Stationery from the popup menu, and save it into the Claris folder in your System folder.

Claris Ships ClarisWorks 2.0 English/Spanish Bundle for Education Market

Integrated software tailored for bilingual instruction and ESL programs

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.
SANTA CLARA, Calif., -- February 16, 1994 -- Claris Corporation today announced that ClarisWorks 2.0 for Macintosh, the #1 best-selling integrated software on Macintosh, is now available in a special English/Spanish bundle for the Education market. The bundle consists of both English and Spanish versions of the product. Both versions offer identical features and user interfaces. The Spanish version has been fully localized with Spanish menus, on-line help, dictionary and thesaurus. The consistency between the two versions makes ClarisWorks ideal for students who are transitioning from one language to another, particularly Spanish students who are learning English.

"Claris recognizes that there are many philosophies to teaching in bilingual programs," said Karen Billings, manager of education solutions for Claris Corporation. "This ClarisWorks English and Spanish bundle can be used in programs whose primary focus is to teach Spanish-speaking students to read and speak English or to teach the core subjects in Spanish while students are learning to speak English. We are bundling ClarisWorks English and Spanish versions to provide students and educators with the best software solution for bilingual and ESL regardless of teaching philosophy."

This enhanced bundle seamlessly integrates word processing, graphics, spreadsheets, charting, database management and communications tools giving education users new ways to easily manage and share information. The ClarisWorks English/Spanish bundle is available now to education institutions in the U.S.

"For both administrative tasks and classroom use, ClarisWorks is one of the best integrated software solutions," said Stephen Cohen, district technology planner for Paterson Public Schools in Paterson, NJ. "Using ClarisWorks 2.0 English and Spanish versions, we're developing an international business studies program for high school students. ClarisWorks provides students fluent in both English and Spanish with a complete tool set for recording, analyzing and presenting data gathered while studying social science subjects like the recent North American Free Trade Agreement."

ClarisWorks sets standard for integrated software

ClarisWorks features a breakthrough in interface design that is unique among integrated packages. While other integrated products bolt together separate mini-applications, ClarisWorks seamlessly integrates word processing, spreadsheet, charting, database, graphics and communications environments.

ClarisWorks 2.0 includes new outlining, presentation slide show and painting capabilities giving students, instructors and administrators a complete set of tools to produce a wide range of documents and manage a variety of information. Worldwide, educators use ClarisWorks for everything from developing lesson plans and creating student exercises, to tracking progress reports and calculating student grades. ClarisWorks is used by more education institutions than any other integrated software package.

Pricing and availability

The ClarisWorks English/Spanish bundle is available to all K-12 and higher education institutions including public and private schools and regional education agencies direct from Claris. The suggested list price for the ClarisWorks bundle is $199 and site licensing options are available. For more information about the ClarisWorks English/Spanish bundle or pricing options, contact Claris Education Sales at (800) 747-7483.

Claris Corporation, a leading worldwide vendor of Windows and Macintosh applications for business, education and home, is a subsidiary of Apple Computer, Inc. with headquarters in Santa Clara, Calif.

Offer for Claris CAD Customers to Switch to Vellum Extended by Ashlar Indefinitely

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
Prices Subject to change, please call Ashlar at 800-877-2745, outside the United States, call 408-746-1800 for more information

Ashlar has extended indefinitely its discount on Vellum to registered Claris CAD customers. Registered Claris CAD users can purchase Vellum 2.5 from Ashlar for $695 for the 2D and $795 for the 3D. This is a significant discount off the standard retail prices of $2495 (2D) and $2995 (3D).

Ashlar Vellum 2.12, the original version available to registered Claris CAD at a special discount price, was available for $399 for 2D and $499 for 3D. When version 2.5 became available, ALL VELLUM CUSTOMERS,including Claris CAD users and regular retail customers, who had purchased Vellum prior to November 1, 1993, were required to pay an upgrade fee to receive Version 2.5. Those who purchased Vellum 2.12 at FULL RETAIL after 11/1/93 received a free upgrade to Vellum 2.5. Claris CAD registered users purchasing the product after 11/1/93, continue pay the initial discount price plus the upgrade fee.

ClarisImpact: Disk Space Sizes for Custom Installations

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
The ClarisImpact Easy Install uses approximately 20MB of disk space to complete the installation. However, the Installer needs additional hard disk space beyond what these files use, which is used for expanding compressed files.

You may not need all of the files that a full install puts on your drive, or you may not have enough disk space to complete the full install. By pressing Customize, you can pick and choose which files you need. For example, if you don't have a color monitor, you can save some space by installing ClarisImpact with only the Black & White styles.

If you install all of the Claris Art, it takes up 7.5MB of disk space. You can save some space by installing minimal Claris Art, which takes up only 1.7MB of disk space, or if you have existing artwork or graphics in PICT, TIFF or EPSF, you can skip the Claris Art altogether.

If you are comfortable working on a program without the online help, you can save another 1.6MB of disk space.

NOTE: If you have other Claris applications, you already have a Main Dictionary, Claris XTND System, and Claris Translators in your Claris folder. The ClarisImpact Installer will only install those translator items that you don't already have, and will update older versions of the Main Dictionary and XTND System.

Below are some sample Mac configurations and custom install options. The first column of numbers is hard disk space required for the installation, the second column is actual disk space taken by the installed files. Remember that after the installation is complete, the ClarisImpact files will only take up the amount of space in the right column.

1. If your Macintosh has a black and white monitor with System 6.07, and no need for additional artwork or special fonts (a "Bare Bones Installation"):

ClarisImpact Application	1.3MB	1.3MB
B&W Styles	1.6MB	1.5MB
Total:	2.9MB	2.8MB

2. For a Macintosh running System 7 with a black and white monitor, where you will be creating mostly report documents and charts:

ClarisImpact Application	1.3	1.3
B&W Styles	1.6	1.5
ClarisImpact Help	2.0	1.6
Fonts for System 7	1.4	1.1
Dictionaries	336K	336K
Total	6.6MB	5.8MB

3. For a Macintosh running System 7.1 with a color monitor, where you have a need for some artwork and you'll be translating files from other programs into ClarisImpact:

ClarisImpact Application	1.3	1.3
Color Styles	1.8	1.7
Color Palettes	64K	32K
Minimal Claris Art	2.1	1.7
Fonts for System 7.1	1.4	1.1
XTND Package	1.2	980K
Total	7.8MB	6.8MB

4. You have a Mac with a large color monitor and have System 7.1. You create presentation slides and complex reports but you want to add punch to your work:

ClarisImpact Application	1.3	1.3
Color Styles	1.8	1.7
ClarisImpact Help	2.0	1.6
Claris Art	9.3	7.5
XTND Package	1.2	980K
Fonts for System 7.1	1.3	1.1
Total	16.9MB	14.1MB

LocalTalk PC Card: How to Configure It for TOPS

TOPS documentation claims support for the LocalTalk PC Card. I want to communicate through the card from a PC using TOPS. Although TOPS claims support for the card, their technical support group could not tell us how the card must be configured. Can you help?

This article has been archived and is no longer updated by Apple.
TOPS Technical Support told us how to configure their software for use with the LocalTalk PC Card. The most common problem encountered in this situation is that some required software is not included with the LocalTalk PC Card. AppleShare PC and the LocalTalk PC Card were originally shipped as a package. They are now separate items.

Users of the TOPS card should have an AUTOEXEC.BAT file that looks like this:

```
ALAP
PSTACK
TOPSTALK
TOPSKRNL
```

Users of the LocalTalk PC Card should have an AUTOEXEC.BAT file that looks like this:

```
LSL
LTALKP
ATALK
COMPAT
TOPSTALK
TOPSKRNL
```

Note that the first two files for the TOPS card user are replaced by the first four files shown for the LocalTalk PC Card user. The .COM files associated with the names above are included with AppleShare PC.

After starting up with the above AUTOEXEC.BAT file on disk, run TOPS menu and proceed as described in the TOPS documentation.

ClarisWorks: Apple Events Are Not Supported

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
Applications that are "Scriptable" by scripting applications such as AppleScript, contain a resource called the "AETE Resource." ClarisWorks 2.0 through 2.1v2 contained an AETE resource. This resource was removed in ClarisWorks 2.1v3 and v4. AppleEvents are NOT A SUPPORTED FEATURE OF CLARISWORKS, nor have they been fully tested by Claris. You can still send events to ClarisWorks 2.1v3, v4, and 3.0 but Claris Corporation does not recommend or support this.

Here is how the ClarisWorks 2.1v1 and 2.1v2 event dictionary appears in the AppleScript Script Editor. ClarisWorks 2.0 did not include Core: Class events.

Required Suite: Events that every application should support

Quit Application: Quit application
Quit Application

Print Documents: Print the specified list of documents
Print Documents alias -- List of documents to print

Open Documents: Open the specified list of documents
Open Documents alias -- List of documents to open

Open Application: Sent by finder when user double clicks on the application
Open Application

Core Subset: Subset of definitions from the core suite

Get Data: Get the data from an object
Get Data reference -- The object whose data is to be returned
[Return Type type class] -- Desired types for data
Result: anything

Set Data: Set an object's data
Set Data reference -- The object to change
Data anything -- The new value

Class Document: A live document
Elements:
Record by numeric index, by name
Properties:
Name string [r/o] -- The name of the document

Class Record: A Data Base record
Elements:
Cell by numeric index, by name
Properties:
Index integer -- The record number

Class Field: A Data Base field
Elements:
Cell by numeric index, by name
Properties:
Name string [r/o] -- The name of the field

Class Cell: A Data Base cell
Properties:
Name string [r/o] -- The name of the field

CLARIS ENDS DEVELOPMENT OF CLARIS RESOLVE

Claris Resolve users offered option to purchase ClarisWorks for Macintosh at special reduced price

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.
SANTA CLARA, Calif. -- February 28, 1994 -- Claris Corporation today announced that it has ceased development of the Claris Resolve spreadsheet application and will not sell it after March 31, 1994. Claris will continue to provide technical support for registered Resolve users for one year (through March 31, 1995).

To assist Claris Resolve owners who may want to move to another spreadsheet in the months ahead, Claris is offering these users ClarisWorks 2.1, the #1 best-selling integrated application on Macintosh, for a special price of $29 in the U.S. through September 30, 1994. The suggested retail price for ClarisWorks 2.1 is $299.

In addition to its spreadsheet functionality, the "document-centric" approach of ClarisWorks combines full-featured word processing, database, painting, drawing, outlining, communications and presentations capabilities in a single compact application. Many Claris Resolve users in education, home and business settings who do not require custom spreadsheet applications and scripting may find its breadth of solutions a compelling choice.

"Despite its usability breakthroughs, superior performance and minimal hardware footprint, Claris Resolve was unable to garner the necessary market acceptance to be a sustainable long-term competitor in the Macintosh spreadsheet market," said Steve Pollock, vice president of worldwide product marketing. "While clearly a difficult decision, this move enables Claris to focus on delivering award-winning cross-platform products in important categories, and evolving key Macintosh applications. It is our hope that by extending the ClarisWorks special offer as one possible transition path and by continuing technical support for an additional year, Claris can show its appreciation for the past support of Claris Resolve owners."

Claris Background

By consistently focusing on products for generalist users, a fast-growing segment of the total software market, Claris has grown to one of the 10 largest personal computer applications software vendors worldwide. Claris recently reported that net revenues for the first quarter of FY1994 were $44.9 million, representing 16 percent growth over the $38.8 million posted the same quarter in 1993.

Claris growth rate continues to outpace the software industry average. The company's FY1993 revenues were $154.4 million, a 48 percent increase over FY1992.

The continuing success of FileMaker Pro and ClarisWorks on both Windows and Macintosh platforms accounted for much of first-quarter growth, Claris said. Those products are best-sellers in the Macintosh database and integrated software categories, respectively.

Claris launched 1994 with the shipment of MacWrite Pro 1.5, the popular Macintosh word processor, and ClarisImpact on Macintosh, the first of a new family of cross-platform graphics products. This year Claris will also introduce new software for Apple's Macintosh with PowerPC microprocessor, and continue to break new ground in combining power and usability with Windows and Macintosh applications.

For general information about Claris products and non-technical questions, users should call customer relations at (800) 3CLARIS. Claris Resolve users who wish to order ClarisWorks at the special $29 price should call (800) 544-8554. Their Claris Resolve product serial number will be requested as proof of purchase.

Claris Corporation, a leading worldwide vendor of Windows and Macintosh applications for business, education and home, is a subsidiary of Apple Computer, Inc., with headquarters in Santa Clara, Calif.

ClarisWorks: Macintosh Version 2.1v2 Updater, Release Notes

Release Notes included with ClarisWorks 2.1v2 Updater

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.

Welcome to ClarisWorks 2.1!

Thank you for choosing ClarisWorks 2.1. We're excited about this new release of ClarisWorks and we hope you will enjoy using it. This document provides some late-breaking information that couldn't be included in the printed manual.

Please read this file carefully. It contains several important tips that may give you better results or make it easier for you to use ClarisWorks. You may even wish to print this document for use after you have installed ClarisWorks.

PERFORMANCE TIP

* Adjusting ClarisWorks Memory

As with any Macintosh program, you will gain greater flexibility and performance if you increase your application memory size. This is especially true if you work in the Paint environment, work with larger documents, or work with a number of documents during the same session. Similarly, if it takes a long time to print documents, increasing the memory size may help. For more information on increasing memory size, consult the ClarisWorks Installation and New Features Guide, under adjusting memory.

NEW FEATURES AND CHANGES IN VERSION 2.1

ClarisWorks version 2.1 has a number of powerful new features, and enhancements to several existing features. The Installation and New Features Guide describes the most important changes. Additional information is outlined below.

* Balloon help is now available for the buttons in the shortcuts palette. If you are unsure of which command a button performs, choose Show Balloons from the Help menu to display the name of the button.

* The Make Custom Style shortcut now appends style information to the font and size in the Style menu.

* If you import a PICT file into a paint frame or document, ClarisWorks now matches the imported file's resolution. It will also use the color table of the original picture.

* If you set the default fill pattern to be transparent, ClarisWorks now displays the Transparent icon in the pattern indicator of the tool panel.

* New file filters have been added to ClarisWorks 2.1. A ClarisWorks 1.0 text filter has been included to simplify translation of ClarisWorks 2.0 or 2.1 files to ClarisWorks 1.0. A new filter provides support for reading and writing Excel 4.0 files.

* ClarisWorks 2.0 and 2.1 files are identical. Version 2.0 can open version 2.1 files automatically and vice versa. ClarisWorks 1.0 files can be opened in version 2.1. You will be notified when ClarisWorks 1.0 files are opened in version 2.1 and, to ensure that your ClarisWorks 1.0 files are not saved over unintentionally, a suffix "[v2.1]" will be appended to the file name. If you want to replace your ClarisWorks 1.0 files with ClarisWorks 2.x versions, you may do so easily. Simply perform a Save or Save As, remove the "[v2.1]" when defining the file name, and click "Yes" when asked if you want to "Replace existing" file.

* Discretionary hyphens included in documents created in version 2.1 will appear as box characters when the file is opened using 2.0.

SOME TIME SAVING FEATURES

* "ABOUT Stationery"

This file contains information about using and creating Stationery files with ClarisWorks 2.1. Stationery files are templates that can save you time when you create a new document such as a memo or letter. To access the "ABOUT Stationery" file, select New... from the File menu, click on the pop-up list to the right of the Stationery label, select "ABOUT Stationery", and click OK.

* "ABOUT Sample Files"

This file describes the Sample Files that are included with ClarisWorks 2.1. Some of the sample files were specifically created to be used as is-just enter your own information. Other sample files demonstrate the wide range of possibilities ClarisWorks provides. "ABOUT Sample Files" is in the Sample Files folder within the ClarisWorks 2.1 folder.

* "More About Shortcuts"

Shortcuts are timesavers that give you pushbutton access to over 150 of the most frequently performed day to day tasks. You can personalize your Shortcuts palette to include those commands that you find useful. For a complete list of the Shortcuts and brief descriptions of what they do, open "More about Shortcuts". You will find it in the Sample Files folder within the ClarisWorks 2.1 folder.

PRINTING TIP

* LaserWriter IIg/IIf Owners

If you notice that horizontal or vertical lines in your documents are not being printed correctly, you will need to make a simple adjustment to your LaserWriter's settings. To do this you will need the LaserWriter tools disk that came with your printer. Just follow these three steps:

1. Open the LaserWriter Utility application on the LaserWriter disk.
2. Under the Utilities Menu, choose Set PhotoGradeTM.
3. Move the slider all the way to the left towards the "More Levels of Gray" option.

Your printer has now been reconfigured with the proper settings.

COMMUNICATIONS NOTES

* Claris Kermit Tool

ClarisWorks 2.0 includes a Kermit file transfer tool for Apple's Communications Toolbox. It is automatically installed into the Extensions folder under System 7 or into the Communications Folder under System 6. This tool behaves in much the same way as the XMODEM file transfer tool. If you use System 7, you can turn on Balloon Help under the Help menu to get additional information.

* VT320 Keys

This sample document contains Shortcuts that are the equivalent of function keys found on VT220 and VT320 terminals. When you open the document you will see information on using these Shortcuts.

Claris Applications: Crashes when Launched from a Server

What to check for if your application crashes when you launch from a server machine

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.

Launching a server-based application may result in a crash at the point of the splash screen display, if the workstation is running a 68040 microprocessor. Apple Computer is aware of the issue, and is distributing a system extension named Network Launch Fix, version 1.0.2, that corrects the issue. Note that this issue only applies to 68040 computers.

Published Date: Feb 18, 2012

Multi-launching ClarisWorks from a Network Server (All)

Results of informal testing of the multi-launch capabilities of ClarisWorks 2.1v2 along with some historical findings about previous versions.
This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
ClarisWorks can be installed on a server and legally launched by multiple users as long as the server uses a "software mechanism" that meters usage and locks out those concurrent users in excess of the legal number of licensed copies owned. Claris has not officially tested this configuration, but informal testing indicates only a few limitations, outlined below.

NOTE: This configuraton is only recommended for sites that have Macintosh computers without hard drives or where hard drive space is very minimal.

1. Install ClarisWorks on the server using the Easy Install button.
2. After installing, open the System folder and then open the Claris folder.
3. Choose Select All from the Edit menu and drag all the files into the ClarisWorks application folder that the installer created at the root level of your hard drive.
4. Arrange the files in the ClarisWorks folder so that the ClarisWorks application, and the Sample Files and Tutorial folders are visible and all the other files are hidden from view in the window.
5. Set the access priviledges on the server according to your needs. Note that limitations differ depending on whether you provide write access or not.

In our informal testing, all of the following actions were done simultaneously on two guests to test the multi-user capabilities of the auxiliary files located in the ClarisWorks folder on the server.

Things that worked fine with read/write access

Online Help
Show Balloons
ClarisWorks Stationery
XTND
Thesaurus
Auto Hyphenation

User Dictionary - A word added by one user is accessible by another user. Thus, the User Dictionary is shared by all users.

Preferences - The Make Default button modifies the Preferences file, but this doesn't take effect for other users until they Quit and re-launch ClarisWorks. Default Preferences are loaded at launch time. The same Preferences file is shared by all users, making individual default preferences impossible in this configuration. However, each person can create preferences for individual documents without using the Make Default button.

Things that didn't work with read/write access

Main Dictionary - only accessible by one user at a time; successive users get the erroneous message "Cannot find Cannot write to hyphenation dictionary."

Claris Fonts - Only the first user to launch ClarisWorks sees WYSIWYG fonts in the Fonts menu. With access priviledges set to Read Only, no one sees WYSIWYG fonts.

ClarisWorks Labels - Only one user can access ClarisWorks Labels at once. Successive simultaneous users will only see the Custom item.

Additional things that didn't work when access priviledges were set to read only

Clicking the Learn button in the spell checker brings up the erroneous message "Cannot find Cannot write to hyphenation dictionary..."

Recording a macro without selecting the Document Specific checkbox results in an alert that the File is Locked. The same thing happens if you try to Edit the Shortcuts pallette.

Clicking the Make Default button in Preferences results in a File is Locked alert.

Font menu is not WYSIWYG for first user to launch or any successive users.

Earlier Versions

Only ClarisWorks1.0v3 and later are capable of being multi-launched off a network server.

TA42674_Multilaunching_ClarisWorks_from_a_Network_Server_All.pdf

ClarisWorks 2.0v1 crashes when a person does a spell check when someone else is also using that feature. Only the second user crashes. The person who was already using the feature is unaffected.

Basic Troubleshooting for PowerTalk issues with ClarisWorks and MacWrite Pro

Basic Troubleshooting for PowerTalk issues

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.
Q:After the installation of an application, the mailbox is gone from the desktop.
A: Installer script turns off the mailbox since it is seen as an application. Go into the PowerTalk setup control panel and verify that PowerTalk services are unavailable and reboot the machine.

Q: In ClarisWorks 2.1 or MacWrite Pro 1.5, the mail command is gray under the file menu.
A:Either 7 pro is not installed or PowerTalk services are unavailable. To check for 7 pro, do about this Macintosh and verify that the system version is 7.1.1. If that's what they have, again go into the PowerTalk setup control panel and verify that PowerTalk services are available.

Q: In ClarisWorks 2.1 or MacWrite Pro 1.5, I sent a document and it never arrived at the destination.
A: Was it sent as server based mail or direct AppleTalk? Whichever it was try the other method, by readdressing the mailer. Are you able to send mail to that particular destination using AppleMail?

Q: In ClarisWorks 2.1 or MacWrite Pro 1.5, After I've chosen the Add mailer command, I click on the recipients button to address the letter and nothing comes up or it freezes?

A: Remember, Mailer and above is system level, Below Mailer is Claris territory. Best way to check for problems is again try to address an AppleMail document the same way and look for the same results.

Published Date: Feb 18, 2012

ClarisWorks and MacWrite Pro Now are both Powertalk-savvy.

MacWrite Pro 1.5 and ClarisWorks 2.1 fully support PowerTalk, the new collaboration software built into Apple Computer Inc.'s System 7Pro.
This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
ClarisWorks and MacWrite Pro now are both Powertalk-savy. What does that mean? PowerTalk is one of the first products to come out of Apple's emerging technology, AOCETM (Apple Open Collaboration Environment),the set of programming and human interface elements that will one day be as common as the print command in all your applications.
Until that day comes, ClarisWorks 2.1 and MacWrite Pro 1.5 are ahead of the game in this new genre for software: collaborative applications that help individuals communicate and work together with others more effectively. PowerTalk lets you consolidate and share data. In addition, you can also send electronic mail and faxes directly from within MacWrite Pro1.5 or ClarisWorks 2.1.
The new Mail command in the File menu is what you use to address and send several types of local and remote messages. You can attach any type of document including text, graphics,video and sound to your mail documents. With this new soft ware, you no longer have to exit your document, open a communications application, create a document and attach your MacWrite Pro or ClarisWorks document to send local or remote messages.
This is no ordinary electronic mail. You can mail in three ways, as:
* **Apple Mail.** This would be useful if the recipient does not have the PowerTalk savvy application you are using to send mail. Since AppleMail comes with System 7 Pro the recipients of your mail will be able to view and edit the document from within AppleMail. Think of the AppleMail environment as TeachText, your very basic word processor.
* **Snapshot.** The recipient gets a picture (PICT format) of your document with all the formatting. I can be read in AppleMail.
* **Native format.** The recipient gets a document of same type. Providing they have the same Application you sent it in, they will get a MacWrite Pro or ClarisWorks document. You can also take advantage of the XTND translator system that is part of the Claris application send files in an appropriate format. Just address your document and choose Send from the Mail sub-menu in the File menu. Send spreadsheets from ClarisWorks, QuickTime movies in MacWrite Pro frames. Since the process is streamlined and uniform, you don't have to think about it.

Collaborative capabilities PowerTalk is more than just electronic mail. AOCE technology also includes authentication services and over the wire encryption to prevent wiretapping on the network.PowerShare catalog services are available in a powerful, flexible, easy-to-maintain distributed database. PowerTalk offers built-in store and forward messaging in addition to mail. Through the use of service access modules, PowerTalk users will be able to exchange information with anyone, on any platform, including fax and voice mail.
Exchanging ideas in a workgroup has never been easier. Whether you need to talk to people in groups or to individuals who dial in remotely, application s that support PowerTalk offer you a number of solutions that save you time and simplify the present ways you communicate. In sum, PowerTalk allows you to:
* Exchange mail with other PowerTalk users without a server or system administrator.
* Send items with a simple "drag and drop" of desktop icons
* Send a single document over multiple delivery mechanisms (fax, electronic mail, and so on) with a single command
* Receive all your mail from multiple sources in a single desktop mailbox
* Use PowerTalk Catalogs to organize the information you refer to most often when collaborating with others
* Implement basic mail services with the AppleMail letter application, which supports text, images, video, and sound
* Protect your mailbox and other PowerTalk services with a single access code
* Use legal and binding digital signature (DigiSign software) to approve documents electronically
* Use PowerTalk-savvy applications to further automate and extend your messaging capabilities
* Obtain additional authentication and encryption capabilities with optional PowerShare servers.

The method and the magicÉ On a basic level, PowerTalk has support for AppleTalk,which allows a small team of users to communicate on a network without the use of a server. If you have a small work group, and you want to be able to send mail back and forth, System 7 Pro and ClarisWorks is potentially all you need to run your office. Larger workgroups will want to use PowerShare Collaboration Servers, with the full range of server-based options and centralized administration of such services as messaging, calendaring and project management.

Setting up your PowerTalk services is as easy as installing System 7 Pro, and launching either ClarisWorks 2.1 or MacWrite Pro 1.5. After installing System 7 Pro, your desktop will be a little different than before. You will have a PowerTalk folder on the root level of your hard drive, new icons on your desktop, and two new Apple Menu items. The new interface items are explained briefly below. The PowerTalk desktop. Using System 7 Pro, you will find PowerTalk installed in its own folder, in addition to having new icons on your desktop. The icons are for Catalogs (the "electronic yellow pages" that contain addresses, mail centers and services), the PowerTalk KeyChain, which gives you access to servers on your network, and the Mailbox, which contains incoming electronic documents, such as faxes and e-mail, addressed to you.
PowerTalk Key Chain: The Key Chain opens on your desktop to show the services available to you and provides a way to add and remove services. Gain access to all your services by typing just one access code.You can easily add keys to the Key Chain, one for each AppleShare and file sharing account, your PowerShare service, Direct Dialup mail, Direct AppleTalk mail, and any other third party-supplied PowerTalk-related service such as fax and other mail systems. You can quickly lock your Key Chain to secure your services while you are away from your computer. But, if you forget to do so and your computer is left idle for a specified number of minutes, PowerTalk will automatically lock your Key Chain for you.
Mailbox: Incoming mail items arrive in a single universal mailbox directly on the Macintosh desktop. That means all your QuickMail's, internet mail, AppleLinks, electronic faxes are all in one place, consolidated. Items can be opened, copied to folders, and otherwise manipulated just as you would any other desktop objects. From the Mailbox, you can also view the correspondence you have sent to others.
Catalogs: The Catalogs icon on your desktop allows you to see the catalogs (for example, collections of information about people,

services, and other things you can work with) to which you have access. Information is displayed hierarchically, and you can search by key words or phrases. Open catalogues to browse Information Cards (see entry below). PowerTalk also lets you create catalogs of information that facilitate your collaboration with others, from simple group address lists to collections of images or sounds.

Information Cards: Information cards are new kinds of Finder icons that hold information about people, places, or things, including addresses of users and groups with whom you want to communicate.You can send mail in the Finder by dragging and dropping files or folders to the destination single addressee or group addressee Information Card. Think of it as having their address right on your desktop.

DigiSign Utility: This utility takes advantage of encryption technology to facilitate a means of attaching electronic approval to computer-generated documents. Not only can this feature potentially save paper that gets used during requests for signatures, but this feature is also helpful in providing an audit trail of people that have worked on a document during a work cycle. More importantly, the digital signature that is gets attached is legal and binding (unlike a scanned signature), because to get your digital signature, you must go through the process of getting your digital signature notarized and certified by the appropriate authority (please refer to your System 7 Pro guide that came with your system software for details)

The power of PowerTalk is surely in its simplicity as well as its ability to fit into large and small workgroup situations. Its underlying framework of AOCE technology is both what allows you to take advantage of your present methods of communication and what will prepare you for things to come in the ever-changing world of personal computing. Applications like ClarisWorks and MacWrite Pro take advantage of all the full feature set of PowerTalk and can now be thought of as groupware or collaborative software to address the growing communication needs in the work- place.

ClarisWorks: Clearing all Text Attributes (DB)

Clear all formatting of text by moving the data into a spreadsheet and then back into the database.
This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
Changing the font attributes of specific data while in Browse mode will affect the formatting in all of the layouts of your database. If at some point, you need to remove this formatting, there are a couple of steps you can follow. Simply stated, you can clear all formatting of text if you move the data into a spreadsheet and then back into the database.

ClarisWorks for Macintosh

Start by going to a layout that contains all of the fields in your database. If you are not sure if you have one, create a new Standard layout. (Note: As long as you have fewer than 41 fields defined, this new layout should contain all of your fields. If you have more than 41 fields defined, you will have to insert the fields into the layout individually)

From this layout, click outside a field to select an entire record, then hold the Command key down while you type the following:

```
A  X  N  4  Return  V  C  W  N  V
```

These are the keyboard command equivalents of:

```
1) Command - A     Select All
2) Command - X     Cut
3) Command - N     New...
4) Command - 4     "Spreadsheet"
5) Return          "OK"
6) Command - V     Paste
7) Command - C     Copy
8) Command - W     Close
9) Command - N     "No"
10) Command - V     Paste
```

Note: This solution is designed to replace all of the records (that are not hidden) with new records that contain the same data, yet without formatting. If you only need to remove the formatting from one field of one record, or a selected group of records, skip the Command-A (select all), and start with Command-X (cut).

ClarisWorks for Windows

Start by going to a layout that contains all of the fields in your database. If you are not sure if you have one, create a new Standard layout. (Note: As long as you have fewer than 41 fields defined, this new layout should contain all of your fields. If you have more than 41 fields defined, you will have to insert the fields into the layout individually)

From this layout, click outside a field to select an entire record, then hold the Control key down while you type the following:

```
A  X  N
```

Select Spreadsheet type from the New document dialog box, and then once again, hold down the Control key and typeÉ

```
   Return  V  C  W
```

Hold down the Alt key and type N, then type Control - V

These are the keyboard command equivalents of:

```
1) Control - A     Select All
2) Control - X     Cut
3) Control - N     New...
5) Return          "OK"
6) Control - V     Paste
7) Control - C     Copy
8) Control - W     Close
9) Alt - N         "No"
10) Control - V     Paste
```

Note: As with ClarisWorks for Macintosh, this solution is designed to replace all of the records (that are not hidden) with new records that contain the same data, yet without formatting. If you only need to remove the formatting from one field of one record, or a selected group of records, skip the Control-A (select all), and start with Control-X (cut).

An alternative solution is to save the file as ASCII and then insert it back into the document.

About ClarisImpact 1.0v2

ClarisImpact 1.0v2 was released mainly to make localization changes. Some issues found in ClarisImpact 1.0v1 have been resolved in the new version.
This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
The key changes for 1.0v2:

- Spell checking on 68000 machines under certain circumstances no longer crashes the application.
- Page setup options are now correctly recognized for several Apple Quick draw printers (Stylewriter II, Apple Color Printer and others).
- Ruler changes in Style editor are now recognized correctly.
- Model and element styles were updated to correctly handle ruler changes in Style editor.

No documentation or on-line help changes were necessary, but all disks require updating.

Cannot resize a Flow or Org Chart Model

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
It is not possible to resize a Flow or Org Chart Model.

The only workaround is to ungroup these types of Models so that you can resize them as a PICT. Although it still looks like a Flow or Org Chart, you will not be able to add new positions or use other Flow or Org Chart features. Given this, it is important not to ungroup any Model unless you are completely satisfied with it or you have made a copy of it.

Changing the Font, Size or Style of Data Chart labels in ClarisWorks and ClarisImpact

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.

Changing the font, size or style of a Value Label in a Data Chart Slice or Bar is not obvious. In order to change the font it is necessary to first select the Series box in the Legend corresponding to the Slice or Bar that has the percentage value you wish to change. A white circle will appear in the center of the Series box indicating that it is selected. At this point you can choose any font, size or style.

NOTE: It is necessary to change each slice in a Pie chart individually.

ClarisImpact: What does Keep Transformation in Replace Clones do?

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.

Keep Transformations in the Replace Clone dialogue enables you to keep any changes (such as scale, resize, flip, rotation, etc.) that may have been applied to a specific object while still allowing you to apply changes to all of your clones. Try this example:

1. Create a new Drawing document.
2. Open the Animals Library.
3. Drag the Cow to the document three times.
4. Change the first cow by resizing it.
5. Change the second cow by filling it with the color green.
6. Select the second cow with the arrow tool.
7. Choose Replace Clones... from the Edit menu.
8. Click on the button Use Selected.
9. Click Replace All.

Notice what happens. Since the Keep Transformations box is checked, the first cow stays resized but is changed to the color green. The third cow is also changed to green.

Now try the same nine steps above, but uncheck the Keep Transformation box. Notice that all the cows are all the same size and green.

ClarisImpact: Wrong Phone Number in Demo Disk Watermark

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
One of the differences between the ClarisImpact demo disk and the regular program is that it prints a watermark over your document. If you were to create a blank page and print it, you would see the words, 'ClarisImpact Demo,' followed by 'To order, call: 1-800-554-8554.'

This phone number is incorrect. The correct number is 1-800-544-8554.

As of April, 1994 the ClarisImpact demo disks have been corrected so that the watermark has the correct phone number. The new watermark is outlined text instead of gray text and reads "ClarisImpact Demo, for more information call 1-800-3-CLARIS".

ClarisImpact: Version 1.0v1 Spelling Checker Crashes on 68000 Macintosh

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.

Spell Checking on a 68000 Macintosh (Classic, SE or Mac Plus) will cause ClarisImpact 1.0v1 to crash with this message, "Sorry, a System Error occurred. File System Map inconsistent." Other messages are possible, such as "Unexpectedly Quit", etc.

If you have an accelerated 68000 Macintosh the crash will not occur when spell checking since the accelerator typically will be using a 68020, 68030 or 68040 processor to accelerate.

This is fixed in ClarisImpact 1.0v2. Contact Claris Customer Assistance at 408-727-8227 for an update.

ClarisImpact: Adding Connectors between Positions in Org or Flow Chart

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
It is possible to draw a connector between two Symbols in a Flow Chart Model but not in an Organization Chart Model.

To draw a connector in the Flow Chart:
1. Click on the Symbol until the add element controls appear.
2. Click and hold down in the center of that Symbol.
3. Drag to the center of the Symbol you want to connect.

Workarounds for the Organization Chart:
1. Try ungrouping the Chart by selecting the Chart and choosing Ungroup from the Arrange menu. This will transform the Organization Chart into a drawing so that connectors can be drawn between any object. The disadvantage is that the you will no longer be able to use Organization Chart commands, because you now have just the graphic representation of that Organization Chart.
2. Try drawing a line with the drawing tools. This line will not be associated with the two Elements it is connecting but if drawn carefully will appear to be a connector.

Organization Charts do not allow connectors to be added since all possible organizational structures can be achieved using the add element controls (the arrows that appear around a Element when you click on it).

ClarisImpact: Adding Many Objects as one Library Item or as Many Library Items

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
If you select a number of objects in a document, then try to add the objects to a Library with the Add button, all the objects will be added as a separate items in the Library.

If you want all of the selected objects to be added to a Library as one item, you must first Group the objects.

The Group and Ungroup commands are in the Arrange menu.
Published Date: Feb 18, 2012

ClarisImpact: Applying Element Style to Adjacent Days

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.

In the ClarisImpact Calendar, "Adjacent Days" are those days which are a part of the calendar grid, but not part of the calendar month. These might be the last few days of the previous month, or the first few days of the next month, which appear at the beginning and end of a calendar created for the current month.

However, if you choose Adjacent Days in the Calendar Settings dialog after applying an Element Style, ClarisImpact will apply that Element Style to the Adjacent Days in the current calendar.

To see it happen:

1) Apply an element style to a day in the calendar.
2) Go to Calendar Settings and turn on Adjacent Days.

You will not see the problem if Adjacent Days is already checked when you apply the Element Style to a Calendar day or if you have not applied an Element Style before you check Adjacent Days.

To fix the problem, shift-click on the Adjacent Days to select them, then apply the desired Element Style from the Element Styles floater to change them back to their original appearance.

Banners Cannot be Part of a Model Style

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
Banners applied to a Calendar will not be remembered by creating a Model Style. This is because banners are extra items on a Calendar that can change from day to day.

Remember that Model Styles save structural information such as what font or what Element Styles a Calendar is using.
Published Date: Feb 18, 2012

Calendar Styles Cut Off Text In Calendar Day

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
Adding an Event or typing text directly into a calendar day will clip the text if the style for that calendar has a thick line or other graphics at the top of the day. The field where the text will show up is at the top of the day style.

The text will be in front of the graphic, but if the contrast between the color or pattern of the graphic and the text is not sufficient, the text will appear to be clipped at the graphic.

If you follow the instructions in the ClarisImpact Getting Started booklet for creating a calendar and applying the International style, your text will appear clipped for this reason.

Two work arounds are:

1. change the color of the text so that it contrasts;
2. change the Element Style for that day.

Published Date: Feb 18, 2012

Can‘t Save Empty Outline as Model Style

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
You cannot save an Outline as a Model Style unless there is some text in the Outline frame.

If there is no text in the Outline frame, ClarisImpact will beep at you.

ClarisImpact Does Not Support Two-Color Patterns

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
MacDraw Pro and MacDraw II documents that have two-color fill patterns will import correctly, but the two-color fills will be replaced with a single-color fill.

In the case of a 68000 Macintosh (Macintosh Plus, SE or Classic) white may dominate.

ClarisImpact does not support two color patterns.
Published Date: Feb 18, 2012

ClarisImpact Gradients Appear Jagged at Extreme Zoom Levels

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
Gradients drawn in certain models display more jagged than other objects when viewed at high zoom percentages. Those objects are displayed as PICT objects, displayed on-screen by the QuickDraw display engine rather than the ClarisImpact display engine.

To see the problem:
1. Create a Pie Chart.
2. Fill one of the slices with a gradient.
4. View the edge of the slice with the gradient at 3200%.

The gradient will print properly.
Published Date: Feb 18, 2012

ClarisImpact Network Installation

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
Use the following procedure to install ClarisImpact on a central server volume so that it can then be installed through the network onto any networked Mac:

1) Create a folder on the server called ClarisImpact Install Files.
2) Drag copy each of the five disks of the software into this new folder. This will create three folders named Disk 1, 2, 3, 4 and 5.
3) Now open up the folder called Disk 1 and option-drag the two files: Installer and Installer Script 'up' one layer, i.e. out of that Disk 1 folder but still in the ClarisImpact Install Files folder. This will make a copy of the files so that they exist in the Disk 1 folder as well as the ClarisImpact Install Files folder.

To install from a networked Mac:
1) Find and open the ClarisImpact Install Files folder
2) Double-click the Installer Script file. This will 'unstuff' and install the ClarisImpact files onto the local Mac's hard disk.

These instructions are provided with the understanding that you have purchased sufficient copies of the product so as to be in accordance with Claris software licensing agreements.

ClarisWorks 2.1v2 Does Not Print Certain Objects To The HP DeskWriter Printers. (DR)

There are printing problems specific to ClarisWorks 2.1v2.
This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
When printing from ClarisWorks 2.1v2 to a Hewlett-Packard DeskWriter printer, some objects may not print. Claris has confirmed these problems with most of the DeskWriter printer drivers (DW 2.0, 3.0, 3.9, 5.0 and 6.0 as well as DW-550 1.0 and 2.0).

Some objects that may not print are:

1. Lines drawn with the Freehand tool.

2. Transparent Polygons (Polygons with no fill).

3. Transparent Bezigons (Bezigons with no fill).

4. Transparent Regular Polygons (Regular Polygons with no fill).

Claris Engineering is aware of the problem.

Workarounds: Update your software to ClarisWorks 2.1v4.

Converting PowerPoint or Persuasion Presentation to ClarisImpact

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
Most presentation programs are based on the Outline structure for creating text in a presentation. ClarisImpact 1.0 does not have the capability to convert outlines to Presentations.

PowerPoint and Persuasion documents will not convert directly to a Presentation document in ClarisImpact simply because ClarisImpact does not have a filter for translating these file formats. Your best bet is to copy and paste as much information from PowerPoint or Persuasion to ClarisImpact.

See Chapter 14 for instructions on how to get the best results when making a presentation.

AppleTalk Phase 2 and LocalTalk-Based Networks

I would like to clear up what appears to be some confusion about the use of AppleTalk Phase 2 on a LocalTalk-based network. This is my understanding of the situation:

1) AppleTalk Phase 2 does not necessarily provide any benefit on a LocalTalk-based network and, in particular, does not enhance network performance. It may, however, be useful where the number of nodes on an Internet are expected to exceed 256 (because of address lengths).

2) It is better to use AppleTalk Phase 2 on a LocalTalk-based network when connecting to another AppleTalk Phase 2 network (removing the overhead of the AppleTalk Phase 2 Upgrade Utility). There are also some other benefits related to zone naming and removing some old limitations on Internets. To upgrade a LocalTalk-based network to AppleTalk Phase 2, all that is necessary is to copy the AppleTalk file that comes with AppleTalk Internet Router into the System Folder of any LocalTalk machines.

3) All networked machines should be upgraded to AppleTalk Phase 2 as it eventually will be included in ROMs, and additionally, Apple will stop shipping the AppleTalk Phase 2 Upgrade Utility with the router (from the MacLAN documentation).

4) Can you tell me where devices like LaserWriters fit in? On the AppleTalk Phase 2 Upgrade Utility, when you search for network devices, Macintosh systems with the AppleTalk file are identified as AppleTalk Phase 2. Other Macintosh systems are identified as AppleTalk Phase 1 (that is, on LocalTalk), and LaserWriters are identified as unknown devices. What does this mean?

5) Why does the router need the upgrade utility to route between AppleTalk Phase 1 and AppleTalk Phase 1? How is it used (that is, does it convert the address to AppleTalk Phase 2 and back again)?

Will you confirm or correct my understanding of this issue. I am aware that opinions do differ somewhat within Apple, indicating that there is some confusion in this matter.

This article has been archived and is no longer updated by Apple.

1) AppleTalk Phase 2 routers on LocalTalk-based networks do offer better performance than AppleTalk Phase 1 routers in the following situation:

Reduced broadcast traffic: One of the key reasons for customers to upgrade from AppleTalk Phase 1 to AppleTalk Phase 2 is the split horizon RTMP enhancement. Split horizon reduces the number of redundant routing table entries exchanged by routers. The split horizon algorithm is: All entries whose forwarding port in the routing table is equal to the port out that the entry is being sent are omitted from the RTMP Data packet. In other words, Router A will not include network numbers in RTMP packets broadcast on Network X when Network X is the path (forwarding port) for Router A to reach these other networks.

This information applies to LocalTalk-based networks connected via AppleTalk Internet Routers. Note that each AppleTalk Internet Router running the AppleTalk Phase 2 Upgrade Utility broadcasts AppleTalk Phase 1 and AppleTalk Phase 2 RTMP packets on LocalTalk-based networks. This means that an AppleTalk Internet Router running the AppleTalk Phase 2 Upgrade Utility actually increases broadcast traffic on LocalTalk-based networks networks connected to it.

AppleTalk Phase 2 does not provide any benefit to LocalTalk-based networks and Internets for node addressing. Node IDs are still 8 bits (0-255), and network numbers are still 16 bits (0-65,535).

2) The AppleTalk file you are referring to, when installed in the System Folder, causes version 53 of AppleTalk to be used in place of the ROM version of AppleTalk. Version 53 of the AppleTalk driver gives users on LocalTalk-based networks the ability to support some of the new high-level AppleTalk calls that do not in any way change the protocols used on the LocalTalk physical medium. These new high-level AppleTalk calls are documented in Macintosh Technical Note #250.

It is not necessary to use the AppleTalk Phase 2 Upgrade Utility on AppleTalk Internet Routers when no AppleTalk Phase 1 routers are on the Internet. This means that an all-LocalTalk Internet using only AppleTalk Internet Routers does not require the use of the AppleTalk Phase 2 Upgrade Utility. The LocalTalk nodes do not require the use of AppleTalk version 53 in this scenario.

LocalTalk-based networks, running AppleTalk version 53 or not, do not receive "other benefits related to zone naming and removing some old limitations on Internets" as you imply. LocalTalk networks have not changed in this respect with the advent of AppleTalk Phase 2.

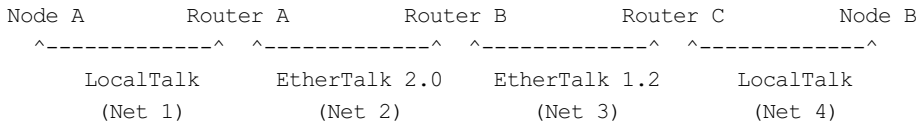
3) Yes, all non-LocalTalk AppleTalk devices should eventually upgrade to AppleTalk Phase 2 compatibility. Yes, future Macintosh systems will ship with AppleTalk version 53 or later in ROM. Eventually, the AppleTalk Phase 2 Upgrade Utility will stop being shipped with the AppleTalk Internet Router. There is no timeframe for this.

4) AppleTalk devices that attach to a network via LocalTalk will continue to work on AppleTalk Phase 2 Internets as they do now on AppleTalk Phase 1 Internets. Remember, LocalTalk-based networks have the same limitations running under AppleTalk Phase 2 that they had under AppleTalk Phase 1. The AppleTalk "Phase 2 Node Identifier" utility that comes on the AppleTalk Phase 2 Upgrade Utility disk declares an AppleTalk node as AppleTalk Phase 2 if the AppleTalk version is 53 or greater and the AppleTalk type is "Macintosh xxx" where "xxx" is the type of Macintosh. If the AppleTalk version is less than 53 and the AppleTalk type is "Macintosh xxx", the node is identified as AppleTalk Phase

1. Nodes with an AppleTalk type other than "Macintosh xxx" are identified as unknown devices.

5) The AppleTalk Internet Router does not need the AppleTalk Phase 2 Upgrade Utility when routing between two LocalTalk-based networks. The AppleTalk Phase 2 Upgrade Utility allows the AppleTalk Internet Router to broadcast and receive AppleTalk Phase 1-style RTMP packets. This is all the AppleTalk Phase 2 Upgrade Utility does. The only time the AppleTalk Internet Router needs the AppleTalk Phase 2 Upgrade Utility is when there is an AppleTalk Phase 1 router on the same physical cable as the AppleTalk Internet Router.

An example of this:



```
Router A is an AppleTalk Internet Router
Router B is an AppleTalk Internet Router
Router C is a Kinetics FastPath 4 - AppleTalk Phase 1 only
```

Since Router C, the FastPath, is an AppleTalk Phase 1 router, the AppleTalk Internet Router (Router B) must run the AppleTalk Phase 2 Upgrade Utility. The AppleTalk Phase 2 Upgrade Utility causes Router B to generate and broadcast AppleTalk Phase 1-style RTMP packets onto Net 3. Router A does not need to use the AppleTalk Phase 2 Upgrade Utility because it is not on the same physical cable as the AppleTalk Phase 1 router (the FastPath). If Router C was replaced with an AppleTalk Internet Router and Net 3 was an EtherTalk 2.0 network, the AppleTalk Phase 2 Upgrade Utility would not be needed on any of the routers.

Default Spacing Dialog Updates Incorrectly

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
If you click on a radio button that is already filled in the Default Spacing dialog of the Flow Chart menu, the Amount boxes will update to show that the other radio button is active, but the correct radio button will not be active.

This means that the values in the Amount boxes will be correct for the unfilled button, rather than the filled button.

There are two solutions available:
1. Do not click a radio button that is already chosen.
2. Click the radio button again and it will switch back to the correct Amounts.

Drop Shadow Turns Legend or Title Black

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
Applying a Drop Shadow to the Legend or Title of a Chart may turn the Legend or Title black.

Legend and Title will turn black with the following Model Styles:
Deco Line
Deco Pie
Deco Bar
Informal Bar
Informal Line
Informal Pie

Only Title will turn black with the following Model Styles:
Modern Bar
Modern Line
Modern Pie

Once the Legend or Title has been changed to black, it will stay black even if you remove the drop shadow.

Workaround:
Select the Legend or Title and fill it with white or some other color. Once you have changed the shadowed Legend or Title to a white fill you can save the new version of this Chart as Style. To save the new version of the Chart as a new Style:

1. Select the Chart so that the gray border surrounds it.
2. Choose Model Styles... from the Chart menu.
3. Click the Add button.
4. Type in a Name for this new Chart.
5. Click the Done button.

This new Style will appear in the Data Chart pre-creation dialog box at the bottom of the list.

Equal Width SmartSize Relationship is Lost with Align Vertically

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
If you have objects with an Equal Width SmartSize Relationship and then Align them Vertically, the equal width relationship will be lost. To see this problem:

1. Create two objects of differing widths and select them.
2. Choose the Alignment command from the Arrange menu.
3. Create an Equal Width Relationship by checking the Create box and then clicking on the Size Horizontal button (upper right hand Alignment icon). Notice that the triangles which indicate the Equal Width Relationship appear.
4. Click on the Align Vertical Center icon (lower line, second from left) or the Align Vertical button.

You will see that the symbols showing the Equal Width Relationship are no longer there.

To make this work properly:
Reverse steps 3 and 4. As a general rule, you should apply object alignment before applying object SmartSize relationships.

Get Two Managers on Your Organization Chart

Several different ways to have two managers appear on your organization chart.
This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
ClarisImpact does not support having two Manager positions at the top of an Organization Chart hierarchy. However, it is sometimes desirable to create such a chart, especially in situations where an individual might report to two managers.

To create this chart, you can try any of these four techniques:

- Create a Manager Element Style that is transparent and use the next level of positions down to start the managers.
- Select Manager from the Organization Chart menu to create a new stand-alone Manager in the current Organization Chart, then manually draw a line between the Worker and the new Manager so that it appears that the Worker reports to two Managers.
- Create the Managers as parts of different frames and overlay the two Organization Charts.
- Ungroup the Chart, so that it is no longer a model frame, but a group of graphic objects, and add any objects you want. The disadvantage to this method is that you lose your Organization Chart tools.

Gradients Not Visible At Extreme Zoom Levels

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
Displaying a gradient at extreme zoom levels in an object with many sides is a very complicated process. High zoom levels may cause ClarisImpact not draw the gradient at all, making it appear that the object has no fill.

You may even get an error message stating, "Some gradients may not be drawn because they are too large. Please note that this alert will not be repeated."

The object will still print with the gradient fill, and when you return to a less extreme zoom level, you will see the gradient fill again on-screen.

Here is an example of how to see this happen:

1. Create a star as large as the screen.
2. Fill the star with a gradient.
3. Zoom to 3200 percent.

ClarisWorks: How to Choose A Different Palette

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
ClarisImpact, ClarisWorks 2.0 and ClarisDraw can use an 81 color palette and an Editable 256 color palette. ClarisWorks and ClarisImpact default to using the 81 color, non-editable palette, while ClarisDraw defaults to a 168-color palette.

To change the palette being used, choose Preferences from the Edit menu (ClarisWorks) or the Layout menu (ClarisDraw and ClarisImpact). Once inside Preferences, choose Palettes (ClarisWorks) or Color (ClarisImpact) or Colors & Gradients (ClarisDraw). When changing to the editable 256 color palette you will have the choice of using the default editable 256 color palette or loading a different editable palette by clicking the Load Palette button (ClarisWorks or ClarisImpact) or the Open button (ClarisDraw).

Here are the editable palettes available for ClarisImpact:

Claris color palette
240 Grays
Cyan to Blue
Earth Tones
Pastels
Presentation
Red to Yellow
Violet to Magenta
YellowGreen to GreenBlue

Here are the editable palettes available for ClarisWorks:

Claris color palette
16 Hues
Pastel
Rainbow
Strange
Vivid

For ClarisImpact, these additional color palettes are in the ClarisArt folder located in the ClarisImpact folder. ClarisWorks installs these palettes in the Colors and Gradients folder in the Claris Folder located in the System Folder.

The 81 color palette is NOT editable but contains the most commonly used colors. The advantage is that it is smaller and takes less space on the screen when you tear it off. This palette is best used with monitors that support 256 colors or fewer.

The editable 256-color palette is larger and editable. By double-clicking on a color you can change what shows in this palette. NOTE: Black and white are not editable and you will hear a beep if you try to change them.

Changes made to any palette are document-specific. In other words, if you open a new document, it will use the default palette. The best way to save a color palette for future use with another document is to use the Save Palette feature in Preferences.

Remember, clicking the Make Default button in Preferences will only remember that you are using an editable palette, not which one you are using.

The easiest way to always use a particular palette is to create a Stationery document (the Stationery document will remember which palette you have chosen).

ClarisWorks: Methods for Saving Gradient and Pattern Palettes

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.

The Gradients and Patterns palettes are much like the Editable 256 color palette: double-clicking on an existing gradient or pattern lets you modify it. The problem is that any new document will not have these new gradients or patterns available. How do you save these palettes for future use?

1. Use a Stationery document to save a modified pattern or gradient for future use.

2. Libraries can also be used to save commonly used gradients, colors and patterns. Simply draw any object and apply the pattern, gradient or color. Add this object to a Library. To use the gradient, pattern or color, add the object and click on that object with the eyedropper. Now any object you draw will have those characteristics.

3. You might want to create a document with all your custom gradients, patterns and/or colors and open it any time you wish to use one of the gradients, patterns or colors. You will be able to copy and paste a gradient, pattern or color from that document into your current document.

Model Styles Not Appearing in Model Pre-creation Dialog

Model Styles are stored in a folder called ClarisImpact Styles which is stored at the same level as the application. By default, ClarisImpact Preferences is automatically placed in this location. Changing these names and locations can cause issues.
This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
Issue:
Model Styles do not show in the Model Styles dialog or in the Pre-creation dialogs.

Solutions:
Try the following solutions one at a time, restarting the application after each solution to see if the issue is fixed. If the issue persists, quit the application and try the next solution.

- From the Finder, perform a find for 'ClarisImpact Color Styles' or 'ClarisImpact B&W Styles' depending on which you are using.
- If the Styles folder is NOT found, reinstall ClarisImpact or attempt to determine if the folder has been renamed.
- If it is found, choose Preferences from the Layout Menu in ClarisImpact (Models section) and check the name of the Current Style Folder. Also, make sure the ClarisImpact Styles folder is located in the same folder as the ClarisImpact application (Styles can also be located in the Claris Folder or the System Folder).
- If the ClarisImpact Styles folder is NOT located in the same folder as the application, when modifying Preferences you could get an error message stating "Could not find the 'ClarisImpact Styles' folder in the application, Claris or System folders. Create it in the application folder?". The issue here is that the folder does not exist and/or has been moved. Follow the steps above to resolve this error message. NOTE: If you would like to locate your ClarisImpact program on the desktop (or anywhere other than the ClarisImpact folder) then try using an alias instead.
- If you reinstall your ClarisImpact application and styles folder, also delete the ClarisImpact Preferences file from the Preferences folder in your System Folder. The preferences could keep track of an erroneous location for the sytles folders.

A Note on File Compression:

Many people use compression utilities to create more space on their hard drives. These compression utilities perform their compression in one of two ways: either they compress the entire formatted contents of the drive, and apply what is called "driver-level compression," or they compress each individual file on the drive and apply what is called "file compression."

- If the Styles from the ClarisImpact Styles folder are compressed by file compression utilities such as Auto Doubler or Disk Doubler, they will not appear in the Model Pre-creation dialog box.
- Driver-level compression utilities like Times Two and MoreDiskSpace do not prevent the ClarisImpact Styles from appearing in the Pre-creation dialog.
- NOTE: ClarisImpact and ClarisDraw Libraries are different. Either compression technique will work fine with ClarisImpact or ClarisDraw Libraries.

New Rows and Columns Insert without Model Style

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
Inserting a Row or Column into a Table or a Task into a Timeline created using a Style will insert without the Style. In other words, the newly inserted Row, Column or Task will look different than the original rows, columns or tasks because it was inserted without a Style.

Solution:
1. Click on any cell in the Table so that it is selected.
2. Choose Model Styles... from the Table menu.
3. Choose the Style that you want applied to the entire Table.
4. Click the Apply button and the click Done.

New Terms in ClarisImpact

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.

Assistant - In an Organizational Chart, a special position that reports to a Manager but is on a different level from other Worker positions.
Adjacent Days - "Adjacent Days" are those days which are a part of the calendar grid, but not part of the calendar month. These might be the last few days of the previous month, or the first few days of the next month, which might appear at the beginning and/or end of a calendar created for the current month.
Banner - a Calendar Event that spans many days. See page 10-2 and 10-7 for best explanation. See below for explanation of Event.
Clone - Once an object is dragged onto a document from a Library it becomes a clone. Also, see below about Replace Clones.
Connector Line - Intelligent lines that connect elements in an Organization Chart or Flow Chart. Connector Lines can also be drawn between objects with the Connector Tool. If you move one of the objects joined by a Connector the line will automatically reshape to accommodate the change. See page 11-29 for information about drawing your own Connectors lines.
Duration - In a Timeline, the length of time it takes to complete a task. See Chapter 8 for more information about Timelines.
Element - the smallest component of a Model. For Example, a bar in a Bar Chart.
Element Style - Color, fill, pattern, background or other style you can apply to the components of a Model.
Event - Text you add to a single day on a Calendar. Similar to a Banner. See Chapter 10 for discussion of Calendar Models.
Latest Start/Finish - The latest time to start/complete a task without delaying the schedule. See Chapter 8 for information about Timelines.
Library - Art contained inside a special document. Items can be dragged from a Library onto a document easily. Make your own libraries or use pre-designed Libraries in the ClarisArt folder.
Manager - Any position in an Organizational Chart with other positions reporting to it.
Planned Finish/Start - In a Timeline, the date you plan to complete/start a task. See Chapter 8 for more information regarding Timelines.
PointGuide - Shows the center of an object or the center point of an object's height or width on any side with a plus sign next to the arrow. Also, the arrow will turn white when it is over an object.
Position - An element in an Organization Chart that represents a job function. Positions usually appear as boxes.
Replace Clones - Allows you to find and replace Clones. For example you could make a change to one of the Clones and change all of them with this feature.
Slack Time - In a Timeline, the period between the Planned Finish date and the Latest Finish date. See Chapter for information about Timelines.
Style - Color, pattern, gradient, text, line setting or other that apply to a Model or an Element within a Model. Styles show in the Model pre-creation dialog.
Subordinate - In an Organizational Chart, a Position that reports directly to another Position.
Symbol - An Element in a Flow Chart connected by Connector Lines to other Symbols.
Task - A project or component of a project that is scheduled and tracked on a Timeline. See Chapter 8 for information regarding Timelines.
Topic - In an Outline, the major headings. Subtopics are subordinate to Topics. See Chapter 9 for more information about Outlines.
Worker - Any position in an Organizational Chart that does not have subordinate positions reporting to it. See Chapter 4 for more information regarding Organizational Charts.

Org Chart with No Text Loses Items when Saved as PICT

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
An Organization Chart that contains no text and is saved as a PICT will lose connector lines and/or positions when placed back in ClarisImpact and ungrouped.

Fortunately, there are a number of work arounds:
1. Use Copy and Paste or Publish and Subscribe to place Organization Chart frames in the same document or other documents.
2. Put text in any one of the positions before saving as a PICT. (Once you have ungrouped it you can remove the text.)
3. Ungroup the Organization Chart before saving as a PICT.

We have also imported Organization Chart PICTs into ClarisWorks and encountered the same behavior. Therefore, it is possible that this will occur with all Claris programs and third party programs.

Outlines in Report Documents Cannot Become Model Styles

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
While in the Report environment it is possible to convert the text to an Outline by using the "To Outline" choice from the Text menu but it is NOT possible to make a Model Style from the resulting Outline. This is indicated by the grayed out Add button in Model Styles.

Explanation:
The Report environment is not a Model. However, it is possible to create an Outline Model in the Report environment and then save it as a Model Style.

Solution:
Use Stationery instead.
Published Date: Feb 18, 2012

Pasted Text Does Not Conform to Model Style

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
Text that is pasted into a model (for example in an outline, or pasted into a field in an Organization Chart position) will have the attributes of the text, not the model. In other words, if you copy some text that is plain and paste it into an outline, the text will be plain. Even if that level of the outline is set to bold, the text will be plain.

Of course you can then select the text and change its attributes, or you can reapply the model or element style and the text will take on the new attributes.
Published Date: Feb 18, 2012

Pasting in-Line Graphics not Re-Sizing Model Horizontally

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.

Copying & Pasting a graphic or Model into a Text or Outline Model will put that graphic or Model in-line with the text. If the Text or Outline Model is smaller than the graphic you would expect the Text or Outline Model to resize, but it will only resize vertically.

Workaround:
Resize the Text or Outline Model horizontally by dragging one of the selection handles.

Replace Clones Doesn‘t Work With Grouped Clones

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
The Replace Clones feature ceases to function on Clones that have been grouped with other objects or other clones.

Grouping a Clone permanently changes it so that it can never be used as a Clone again.
Published Date: Feb 18, 2012

Rotated Arcs Print Clipped

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
Rotated arcs that are not grouped with another object are clipped when pasted in-line in a report document. The arcs will also print clipped.

Workarounds:
1. Group the arc with any other object before pasting it. For example, you could draw a small line segment, set its pen color to white, send it to the back and group it with the arc. The line would not be visible and the arc will appear correctly on screen and will print correctly.

2. Do not paste your graphic in-line.
Published Date: Feb 18, 2012

Shift Selecting an Object Reshapes the Object Slightly

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
If you have both the Autogrid and PointGuide on, shift-selecting a point on an object made with a Shape Tool may reshape the object slightly. This happens because the PointGuide constrains to the nearest Autogrid point, which might not be exactly the point on which the object handle was located.

To see the problem:

1) Draw a star with the star shape tool
2) Turn on Autogrid and PointGuide
3) Select Reshape from the Arrange menu
4) Hold down the shift key and click one of the points of the shape

Workaround:
Turn off PointGuide or Autogrid. This will only happen when both of them are active.
Published Date: Feb 18, 2012

Slow Printing With Older LaserWriter Drivers

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
When printing to a laser printer from ClarisImpact, the version of the printing software that you have installed on your Macintosh can have a significant effect upon the print speed.

To check the version of the LaserWriter software on your Macintosh, choose Page Setup from the File menu when you are looking at your ClarisImpact document. Immediately to the left of the OK button in the top right corner of the Page Setup dialog, you will see a number. That number is your printing software version number.

Some files may take a long time to print using the LaserWriter 7.x driver. Printing may be up to ten times faster using LaserWriter driver 8.0. To get the most up-to-date driver for a non-Apple printer, call your printer manufacturer. To get the updated driver for Apple printers, call Apple at 800-767-2775.

Complicated files may include scans or EPSF images or even sophisticated documents created with the drawing tools in ClarisImpact.

SmartAlign Relationship Indicators Disappear

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
Moving objects after using the Alignment feature could make the Alignment dot indicators seem to disappear. This happens whenever you have two or more objects which are selected and exactly on top of each other: overlapping handles are invisible.

The relationship between the objects still exists but the dot indicators are on top of each other and canceling each other out.

Try this test to recreate the problem:

1. Create a square of any size.
2. Duplicate that square.
3. Select both squares.
4. Choose Alignment from the Arrange menu.
5. Check on the Create checkbox.
6. Click on the Align Top button (top row, first choice).

Notice that the relationship is indicated by a dot on each square.

7. Move one square on top of the other.

Note that the relationship dots has disappeared.

Some Models Cannot Have a Background Gradient

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
It is not possible to apply a gradient fill to some Models even though it is possible to choose a color fill.

Models which cannot have a gradient fill are:
Timeline
Table

ClarisImpact will beep at you if you attempt to fill one of these Models with a gradient. All other Models will allow gradient fills.

Workaround:
Change your Timeline to a transparent fill (first choice on the pattern palette) and then draw a rectangle that matches the dimensions of the Timeline. Fill the rectangle with a gradient and send it behind the Timeline.
Published Date: Feb 18, 2012

Timelines can Only Display Dates in Timeline Scale

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
Although it is possible to change the Time Scale in a Timeline Model so that the tick marks indicate days, weeks, months, quarters or years it is NOT possible to change what appears above the tick marks. ClarisImpact will only display dates.

Many people have requested the ability to display other types of time indicators such as:

Week 1, Week 2, Week 3, etc.
Day 1, Day 2, Day 3, etc.
Month 1, Month 2, Month 3, etc.

This is being considered for the next version of ClarisImpact.

DOS 3.3: The I/O vectors

The Apple monitor sends all input and output, including Applesoft and Integer BASIC's I/O, to a pair of two byte vectors. DOS takes the contents of these vectors and saves them to memory, then puts pointers to itself in the monitor's I/O vectors.

This article has been archived and is no longer updated by Apple.

DOS is no longer able to intercept commands when the I/O vectors are changed. A DOS routine starting at $3EA, accessable from BASIC with call 1002, checks the monitor I/O vectors to see if they point to DOS. This routine stores the current values in the I/O vectors and points to DOS in the vector if DOS isn't already there. It's most useful when the I/O vectors need to be modified to a custom I/O routine like the High-Res Character Generator routine in Contributed Software, volume 3. Here's how to use the Character Generator and DOS:

```
10 poke 54,0
20 poke 55,96
30 call 1002
40 print chr$(4);"catalog"
50 print chr$(4);"PR#0"
```

Two ways to Save a Model: as a Style or a Library Item

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
You can store commonly used Models as a Style or as objects in a Library.

To save a Model in a Library:
1. Create a Model.
2. Select the Model with the arrow tool so that there are selection handles on each corner but no gray border.
3. Choose New Library from the File menu.
4. Click the Add button.
5. Save the Library.

To save a Model as a new Model Style:
1. Follow steps 1 through 2 above.
2. Choose Model Styles... from the 2cnd to last menu. This menu will be different depending on the Model you create.
3. Click the Add button.
4. Name the Style.
5. Click the Done button.

Styles you create will show in the pre-creation dialog box when creating a Model. Choose Open Library from the File menu to access a Library you have saved.

Remember that you can save multiple Models of different types in one Library. You can also save a number of Models as a single object (make sure to group the Models before adding them to a Library if you want them treated as one object).

"Not Enough Chart Data" or Chart Error After Moving Table Cells

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
Swapping the right hand or bottom rows of a Table may cause a chart made from that Table to display a message that there is not enough data to draw the Chart or it may redraw the Chart incorrectly.

To see the problem:
1) Create a 3 column by 3 row Table
2) Fill the top row and left column with text
3) Fill the rest of the cells with numbers
4) Select all of the cells and make a line chart
5) Select the second column and drag-swap it with the third column.

You will get a message that there is not enough chart data or the Chart may redraw incorrectly. The problem is that ClarisImpact does not reset the data range to include the column that was moved.

To work around this problem:
1. After you have swapped the rows, go to Range... under the Chart menu and type in the correct range.
2. Reselect the table data and recreate the chart.

"Not Enough Memory to Display PICT Preview" Error Message

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.

Saving a ClarisImpact file that has PICT objects in it as a MacDraw Pro file (under low memory conditions) may result in an alert message that there is not enough memory to display the PICT preview.

MacDraw Pro files do not have a PICT preview, so this alert is meaningless. Hitting the Continue button should save the file correctly.

Calculating The Number Of Work Days (weekdays) Between Two Cells Formatted As Dates (SS)

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
To calculate the number of work days (weekdays) between two cells formatted as dates will require the following formula. This tech note assumes that A1 contains the column heading "StartDate", B1 contains "EndDate" and C1, "Total Work Days" .

C2 (formula)
= I NT((B2-A2)/7)*5 + MOD(B2-A2,7) - IF(MOD(B2-DATE(1904,1,3),7) < MOD (A2-DATE (1904,1,3),7),2,0)

Here's the logic:

1. Take the number of weeks between the two dates and multiply the result
by five working days per week.

2. Add the remaining days which do not make up a full week.

3. If Enddate occurs on a day of the week before Startdate, then subtract the
2 weekend dates.

This formula will provide an accurate calculation of the work days between any two dates. It assumes that StartDate is earlier than (or equal to) EndDate. This does not count the first and last days as work days. If you want Monday through Tuesday to return 2 work days (instead of 1), add one (+1) to the end of the calculation formula.

This formula does not account for Holidays.
Published Date: Feb 18, 2012

Calculating The Number Of Work Days (weekdays) Between Two Date Fields (DB)

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.

To calculate the number of work days (weekdays) between two fields formatted as dates will require the following formula. This tech note assumes that your database contains the date fields, StartDate and EndDate. Define a new calculation field and name it, TotalWorkDays. The formula for this calculation is as follows:

TotalWorkDays (calculation, number result)
=INT (('EndDate'-'StartDate')/7)*5 + MOD ('EndDate'-'StartDate',7) - IF (MOD ('EndDate' - DATE (1904,1,3),7) < MOD ('StartDate'-DATE (1904,1,3),7),2,0)

Here's the logic:

1. Take the number of weeks between the two dates and multiply the result by five working days per week.

2. Add the remaining days which do not make up a full week.

3. If EndDate occurs on a day of the week before StartDate, then subtract the 2 weekend dates.

This formula will provide an accurate calculation of the work days between any two dates. It assumes that StartDate is earlier than (or equal to) EndDate. This does not count the first and last days as work days. If you want Monday through Tuesday to return 2 work days (instead of 1), add one (+1) to the end of the calculation formula.

This formula does not account for Holidays.

Place File... and Publish & Subscribe Do Not Create New Cells or Tasks

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
When you Place a Text file or a SYLK file or into a Table or Timeline, you might want ClarisImpact to automatically create the correct number of cells or tasks for you.

This is not a feature of ClarisImpact. You must set the correct number of cells in the Table or Timeline before using Place File... to import the data. If your Table does not have enough cells, excess data will be lost.

Solution:
Make sure you resize your Timeline or Table appropriately before Placing or Subscribing.

NOTES:
1. Copying and Pasting data will force ClarisImpact to create more cells or tasks.
2. Publish and Subscribe will also not create new Cells or Tasks in a Timeline or Table.

Technique for Conserving Labels (DB)

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
If you have blank labels, and you have only used some of the labels on a page in a previous printing, you may want to reuse those pages by turning them bottom edge up.

If, however, your labels have been pre-printed with a return address or something that makes them "one way only" in your printer, or you've done the above on the page already, here's a technique to print onto the labels that are remaining on the sheet:

1. Use label sheets that have some missing from the top this way.

2. Add new blank records to the database - one for each missing label on the sheet.

3. Sort by any field that always has data in your records. This puts the new blank records at the top.

Delete the blank records after printing.

NOTE: many label and printer manufacturers strongly caution against inserting partially used sheets of labels into a printer because the mechanical parts used to advance the paper in the printer may cause a label to peel off and jam inside your printer. Consult your printer manual or the label box to make sure it is safe to reinsert partially used label sheets in your printer.

Wrong XTND Translators Shipped With ReadySetGo! 6.0

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.

Ready Set Go 6.0 (RSG), a page layout program, uses the Claris XTND Translator System and supplies its own set of translators. These may be used by Claris programs, resulting in the errors.

A temporary workaround is to select the specific translator you wish to use instead of leaving the selection on "All Available"

The desired fix is to contact RSG (Manhattan Graphics) for a 6.02 update. The update, which fixes the problem, is available free of charge for users of 6.0.

A/UX: Data Structure of "sa" Manual Correction

Article Change History

08/31/92 - REVIEWED
* For technical accuracy.

We've tried to use the records in the "sardd" files (directory /usr/adm/sa) to monitor some system resources and to get information about freemem, freeswap, and other dynamically changing parameters.

The customer found that the structure of the records written by "sadc" and the description of this structure in "sadc(1M)" did not match. I checked and found that the records written by "sadc" are 228 bytes on our system and the size of "sa" (System Accounting), as described, is 304 bytes.

Please send me the structure of the information contained in the records of /usr/adm/sa/sardd.

This article has been archived and is no longer updated by Apple.
We researched the data structure of "sa", and it seems that the one described in the "sadc(1M)" manual page is wrong; the "sa" data structure defined in the sa.h header file and used by the "sadc" program has the following structure:

```
struct sa {
struct sysinfo si; /* defined in /usr/include/sys/sysinfo.h */
int szinode; /* current size of inode table */
int szfile; /* current size of file table */
int sztext; /* current size of text table */
int szproc; /* current size of proc table */
int mszinode; /* maximum size of inode table */
int mszfile; /* maximum size of file table */
int msztext; /* maximum size of text table */
int mszproc; /* maximum size of proc table */
long inodeovf; /* cumulative overflows of inode table since boot */
long fileovf; /* cumulative overflows of file table since boot */
long textovf; /* cumulative overflows of text table since boot */
long procovf; /* cumulative overflows of proc table since boot */
time_t ts; /* time stamp */
long devio[NDEVSII4]; /* device unit information */

#define IO_OPS 0 /* number of I/O requests since boot */
#define IO_BCNT 1 /* number of blocks transferred since boot */
#define IO_ACT 2 /* cumulative time in ticks when drive is active */
#define IO_RESP 3 /*cumulative I/O response time in ticks since boot */
};
```

The total size of structure "sa" is 740. However, the record size of "sa" is computed as below:

recsz = sizeof (struct sa) - sizeof d.devio + recsz * sizeof d.devio[0];

The result of recsz from the above equation = 740 - 512 + 0 = 228

However, the first record of the data file will have the size of 232, which includes a 4-byte header at the beginning of the data file. The rest of the records have a record size of 228. If you monitor the size of data file, the size will have this order: 232, 460, 688, 916, 1144, and so on.

Concerning the record of the system accounting report file (/usr/adm/sa/sardd), the "sar" program generates different sizes of output files (from the input

file "sadd" created with "sadc" program) depending on the options specified in the "sar" command line. By default, without any option, the "sar sadd-file" reports with the CPU utilization:

time-stamp %user %sys %wio %idle

If the -A option (all the options -uqbwcayvm) is used, it generates all supported information, like -b for reporting buffer activity, -y for reporting the tty device activity, and so on.

We reported the inconsistency of the "sa" data structure specified in "sadc(1M)" to A/UX Engineering.

Arrow Keys Work Differently In ClarisWorks 2.1 Than In ClarisWorks 1.0 or 2.0 (SS)

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.

In ClarisWorks 1.0 and 2.0, pressing the left or right arrow keys while entering data in the data entry bar of a spreadsheet document would select the cell to the left or right of the current cell.

In ClarisWorks 2.1, using the arrow keys while entering data will move the cursor to the previous or next character in the entry bar, similar to the way text entry works in a word processing document. To move to the adjacent cell, hold down the Option key while pressing the left or right arrow key. Or press the Enter key to enter the data and then you can use the arrow keys to move to adjacent cells.

Equation Editors and EGO Support

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
ClarisWorks 4.0 for Mac and Windows and MacWrite Pro 1.5 support EGO (Equation Graphic Object) for use with equation editor applications. EGO allows you to double-click on the equation and open the equation back in your equation editor, for additional editing.

ClarisWorks and MacWrite Pro are also compatible with equation editors that do not support EGO. With non-EGO aware editors, you'll copy and paste the equation to ClarisWorks via the clipboard. Or, you'll save the equation as a PICT or EPSF file, then Insert that image into your ClarisWorks document.

These programs support EGO:

Drawings Pasted Into Microsoft Word Print Incorrectly

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
Freehand objects and polygons that are brought into Microsoft Word will print incorrectly when using the LaserWriter 8 driver.

Although the image appears correctly on the screen, when printed, the pen color is used as the fill color instead of the correct fill color (e.g. a red triangle with a yellow border will print as solid yellow). In informal testing, the drawing printed correctly from MacDraw Pro and ClarisWorks as well as from Word Perfect. It appears this is an issue with Microsoft and the LaserWriter 8 driver, since the problem only occurs when using Microsoft Word (and PowerPoint) in conjunction with the LaserWriter 8 driver. Microsoft Technical Support is aware of the problem.

The only known work-around is to use the LaserWriter 7 driver.

Apple‘s Portable StyleWriter Driver Update Fixes Some Problems (SS, CM)

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
GDT Softworks, writers of Apple's Portable StyleWriter Driver has announced that two printing problems are confirmed as fixed in their upcoming driver release, version 2.5.

One printing problem surfaced when printing charts to the Portable StyleWriter. In the legend, only the text of the first series will print.

The other problem related to printing from the Communications environment. The page length was being set incorrectly such that only the top two thirds of the page was printed.

The release of the new Apple Portable StyleWriter Driver version 2.5 is scheduled for late March, 1994.

Placing Spreadsheet Files in ClarisImpact Table or Chart Models

If you have information in a ClarisWorks or Excel spreadsheet that you want to use in a ClarisImpact report, you can import the spreadsheet data into either a table or chart model by saving the spreadsheet as a SYLK or an Excel file or by copying and pasting the cells into a ClarisImpact table/chart.
This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
Here are two methods for placing spreadsheet data into your ClarisImpact table or chart model. If you have information in a ClarisWorks or Microsoft Excel spreadsheet that you want to use in a ClarisImpact report, you can import the spreadsheet data into either a table or chart model by saving the spreadsheet as a SYLK or by copying and pasting the cells into a ClarisImpact table/chart.

These are the steps for placing a SYLK file into a ClarisImpact table:

1. In your spreadsheet file, save your file as a SYLK file type.

2. Launch ClarisImpact, and create a new drawing, presentation or report document.

3. Choose the Table or Chart tool, specify model style and number of rows and columns, then click OK.

4. Click in the first cell, choose Place File. In the dialog box, change All Available to SYLK.

5. Choose your SYLK file and click Place. The SYLK format captures the formulas used in your spreadsheet, while Copy and Paste do not. It's important to choose the SYLK translator in the Place File dialog box. If All Available is chosen, "garbage characters" may be placed in the table/chart.

NOTE: Before you create the SYLK file, make a note of how many rows and columns are used in your spreadsheet. When you create the table or chart in ClarisImpact, specify the same number of rows and columns as your spreadsheet. If you haven't specified enough rows or columns, only part of your data will be placed into ClarisImpact. The first figure (Figure 1) is a table specifying two rows and four columns, and was resized after placement. Figure 2 was created with eight columns and four rows. If you haven't allotted enough cells in the Table to allow room for a formula, you may get a message "Formula which could not be understood has been replaced with a value." Add more cells and replace the file.

Figure 1

Figure 2

Copying And Pasting
You can also use Copy and Paste to place your spreadsheet data into ClarisImpact. If you want to use a section of your spreadsheet, you can copy the selected cells and paste them into a table or chart cells. Unlike the SYLK import, ClarisImpact adds rows and columns to accommodate your data. Copy and Paste brings over the numbers that result from a formula, but not the formulas. This is true for pasting Microsoft Excel or ClarisWorks spreadsheets.

ClarisImpact: Selection Handles NOT Placed accurately in an Ungrouped Org Chart

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
In order to resize an Org Chart, it is first necessary to ungroup it. Any of the positions from the Basic Style Org Chart (represented by a rectangle) will not have accurately placed selection handles after resizing.

Steps to recreate:
1. Create an Org Chart using the Basic Style.
2. Ungroup the Org Chart.
3. Resize one of the positions so that it is less than 0.20" in height.

Notice that the Selection Handles are no longer on the corners of the rectangle.

Workaround:
Use any other Element Style in place of the Plain Element Style for the positions in the Basic Org Chart Style. Custom Model Style and other Org Chart Styles do not have the same problem.
Published Date: Feb 18, 2012

ClarisImpact: Slices in an Exploded Pie Chart Overlap or Cover Slice Labels

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.

Slices in a pie chart may overlap or cover a slice label when all slices are exploded and the chart is set to tilt. The workaround is to not explode one or more slices or to not tilt the chart.

Published Date: Feb 18, 2012

ClarisImpact: Carriage Returns in Org Chart

ClarisImpact cannot add a carriage return to an Organization Chart field in the same way that it can with a Flow Chart field (Option-Command-Return).
This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
There is no feature for adding a carriage return to a ClarisImpact organization field as there is with a flow chart field (Option-Command-Return). If you need carriage returns in your organization chart, use Copy and Paste to add a carriage return from a Text model or Report document into your organization chart field. To do this, follow these steps:

1. Create a Report document.

2. Go to the Layout menu and select Preferences.

3. Select Preferences from the Layout menu. Set Text Preferences to Show Invisibles. Click OK to exit Preferences.

4. Back in your Report document, type a few carriage returns and copy one. A carriage return character appears as a bent arrow.

5. Return to your Drawing document and paste your copied carriage return into the fields in your Org Chart where you wish to display carriage returns.

You may want to create an Element Style that has a text block with returns already in it. Here's how to do this:

1. In your organization chart document, select Element Styles... from the OrgChart menu.

2. In the Element Styles palette that appears, click on the triangle button (it points down) to display more options.

3. Click the New button. Rename your style to "Carriage Return."

4. Click the Edit button, which brings up the Style Editor.

5. To add carriage returns, begin typing carriage returns to create a text block. Drag this text block to the organization chart element space.

6. Click OK to exit the Style Editor.

To use this style again in future organization chart documents, you choose the Element Styles... menu, select the "Carriage Return" style and click the Apply button.

Alternate technique
Rather than pasting carriage returns into organization chart fields, you may consider adding extra fields (through the Style Editor) to the organization chart element. This is the equivalent of adding extra lines or carriage returns in an organization chart element. Here's how to do it:

1. Bring up the Element Styles palette in your organization chart Document by selecting the Element Styles... menu from the OrgChart menu.

2. Next, bring up the Style Editor window by clicking on the triangle button for more options; then, type the name of your new style (you might call it "More Fields") in the name box; and click on the New Button.

3. In the Style Editor, drag new fields from the Field tool to your organization chart element.When you release your mouse button, the Field Definitions dialog box appears. Highlight the field you want and click OK.

4. You may need to adjust the size of your organization chart element before you exit the Style Editor.

The new fields appear as extra lines in your organization chart element when you use the style you created here for future organization chart elements.

Remember, an Organization Chart Element Style needs to have at least one field.

MacDraw Pro: Drop Launch Doesn‘t Translate MacDraw II Files

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
Macintosh System 7 has a feature called "Drop Launching," which allows you to drag a file icon over the icon of the application that created it and launch that file into the application. Claris applications allow you to drop-launch in System 7.

In addition, because MacDraw Pro uses the XTND translation system to open and convert files from other document formats, you can drop-launch onto MacDraw Pro files which were created in MacDraw II or files which are in standard graphic formats. MacDraw Pro will launch and translate the files.

However, if you drop-launch a file and MacDraw Pro launches but the file does not open up as a MacDraw Pro document, it is likely that the XTND translation has failed for some reason. To troubleshoot the problem:

1. Quit MacDraw Pro.
2. Open the System Folder.
3. Open the folder titled "Claris."
4. Make sure that there is a file called "Claris XTND System" and a folder called "Claris Translators."
5. Open the Claris Translators folder and make sure that it contains a file called "MacDraw II 1.1"

If any of these files are not present, disable any virus protection and reinstall MacDraw Pro. If all of these files are present, and are exactly where they should be:

1. Open the Preferences Folder inside the System Folder.
2. Throw away the file titled "XTND Translator List."
3. Try drop-launching the file again.

If the file still will not drop-launch successfully, call Claris Technical Support.

ClarisWorks: Converting AOL Stock Portfolio Data into a Spreadsheet (SS)

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.

Curr. Symbol	Qty.	Purch. Price	Gain/ Change	Price	Loss	Value
AMER	1	70 1/2	+5 3/4	25	+45.50	70.50
BORL	1	13 3/4	+1/2	21	-7.25	13.75
IBM	1	54 1/4	+2 1/4	47	+7.25	54.25
MSFT	1	80 3/4	-1/2	83	-2.25	80.75
SGI	1	24 3/4	-3/8	28	-3.25	24.75

The data above is an example of what you get when you save an America Online (AOL) stock portfolio as a file. It can be useful to analyze this information in a spreadsheet. However, spreadsheets require data separated by tabs, and since the portfolio is saved with spaces in between columns of data rather than tabs, some text processing is required.

The find/change command in ClarisWorks comes in handy here. The following instructions step through a process which results in a spreadsheet version of your portfolio.

1. After saving the stock portfolio as a file, open the file and copy the data.

2. Create a new ClarisWorks word processing document and paste. Delete the Totals row.

3. Choose Find/Change from the Edit menu.

4. Enter 2 spaces in the Find field and \\t into the Change to field. Press Change All.

5. Enter \\t\\t into the Find field. Keep pressing Change All until you get the message that zero occurrences were replaced.

6. Select All and Copy.

7. Create a new ClarisWorks spreadsheet and Paste.

If you want to convert Prices from fractions into decimal numbers, use the formula below. In this example, the fractional value in Price (starting in C4) is being converted into a decimal number in column H. You can cut and paste this formula into cell H4 and use the Fill Down command in the Calculate menu to fill a selected range automatically.

```
=IF(FIND("/",C4,1)=0,C4,LEFT(C4,FIND(" ",C4,1)-1)+ (MID(C4,FIND(" ",C4,1)+1, FIND("/",C4,1)-FIND(" ",C4,1)-1))
/ RIGHT(C4,LEN(C4)-FIND("/",C4,1)))
```

NOTE: BBEdit and McSink are even better suited to doing steps 3-5 because they can convert space runs of 2 or more to a single tab. Both are available in the AOL libraries, keyword: FILESEARCH.

ClarisWorks: Frame Not Showing But Still Part Of The Document

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.

If you have a floating spreadsheet frame on a word processing document on any page but the first and you deleted all of the text on the page containing the frame the page will disappear but the contents of a cell in the spreadsheet frame will be found by doing a find in the Find/Change dialog box. The find will not display the page with the frame but does acknowledge the presence of the item you were looking for. To make the frame reappear you need to select the text tool, click into the document and hit enter to add more pages.

ClarisWorks: VT102 Application Emulation & Keyboards

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
There are problems with several of the Apple Keyboards (including the PowerBooks) in properly mapping VT102 application sequences to the keypad and cursors from the hardware. The software keypad (under the "Keys" menu) usually works ok. The problem is not with ClarisWorks itself but with the VT102 tool (1.0.1 and earlier), which is written by and supplied to us by Apple Computer.

The lists of keyboards affected include but are not necessarily limited to:
PowerBooks
Apple Keyboard II
Apple Adjustable Keyboard

The keys possibly affected include:
The Arrow (Cursor) keys
The "+" keypad key
The "-" keypad key

The workarounds are as follows:
Use the "Keys" Menu.
Substitute an extended or original Apple Keyboard for the problem keyboard.
Wait (hopefully) for a fix from Apple in the form of a updated VT102 tool.
Find a 3rd party VT102 or VT320 tool that works (BBS's or 3rd party vendors).
Use some other communications program that does not use the Communications Tool Box.

MacDraw Pro: Gradients in Polygons don‘t Print to the StyleWriter I

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.

Polygons (other than rectangles) filled with directional gradients in MacDraw Pro may not print to the StyleWriter I printer using the StyleWriter I driver. The polygon itself will print properly, but it will not be filled with a gradient.

This appears to be a problem with directional gradients that are oriented very closely to the four main quadrant axes: 0¡, 90¡, 180¡ and 270¡. Editing the gradient so that it is oriented at least 5¡ away from the axis (i.e., 95¡ instead of 90¡), then reapplying that edited gradient to the polygon, appears to solve the problem.

"Circular" and "Burst" gradients appear to print properly, although, as with all gradients printed to a StyleWriter I, they print very slowly and in "bands" (both are QuickDraw limitations).

ClarisImpact: Beep When Applying Element Styles

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.

Question:
When I try to apply an Element Style to an Element in some Models, ClarisImpact just beeps at me. Why?

Answer:
Not all Element Styles can be applied to every Element in every Model. ClarisImpact indicates that this Element Style is not applicable to the selected Element by beeping at you. For example, it is not possible to apply a gradient element such as the "Blue-coral gradient" Element Style to the background of a Chart Model.

ClarisImpact: Hardware and System Software Compatibility

Hardware and Peripheral devices which have been tested with ClarisImpact.

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.
ClarisImpact 1.0v1 is certified as fully functional in the following hardware and System software environments with a minimum memory requirement of 2 MB RAM (System 6.0.x) or 4 MB RAM (System 7.0.x):

Macintosh Portable
Macintosh Plus
Macintosh Classic family
Macintosh SE family
Macintosh II family
Macintosh Quadra family
Macintosh PowerBook family
Macintosh Duo family
Macintosh LC family
Macintosh Centris family

A hard disk drive is required for all machines. 32-bit QuickDraw version 1.2 or higher is required for all machines with color ROMs (SE/30, LC, or II family) that do not have 32-bit QuickDraw in ROM.

Monitors Supported

Apple 9" display (Plus, SE, SE/30, and Classic)
Apple 10" display (PowerBook and Duos)
Apple 12" color monitor
Apple 12" gray scale
Apple 13" RGB monitor
Apple 14" RGB monitor
Apple 16" RGB monitor
Apple 21" RGB monitor
Apple Portrait monochrome monitor
Apple Two Page display gray scale monitor
Radius Full Page Display monitor
Radius Two Page Display monitor
Radius Two Page Display RGB monitor

Radius Pivot Display monitor
SuperMac 19" color monitor

Printers Supported

Apple LaserWriter family (Plus, II, II NT, IINTX, IINTR, IIf, IIg, IISC, Select 300, Select 310, select 360, Pro 630)
Apple Personal LaserWriter family (NT, SC, LS, 300)
Apple StyleWriter
Apple StyleWriter II
Apple Color Printer
Apple ImageWriter family (I/II/LQ)
HP LaserJet family (III, IIIp, IIID, IIIsi, 4M)
HP PaintWriter
HP DeskWriter family (500, 500C, 550C)
QMS ColorScript 100
Seiko ColorPoint PS
Tektronix Phaser 4693DX
Montage FR1 (Slide Printer)

System Software

System software version 6.0.7
System software version 6.0.8
System software version 7.0
System software version 7.0.1

System software version 7.0.1
System software version 7.1
System software version Pro

Print Drivers

Apple LaserWriter 6.0.2
Apple LaserWriter 7.1.2
Apple LaserWriter 8.1.1
Apple StyleWriter 7.2.3
Apple StyleWriter II 1.2 (Print share/Direct)
Apple Color Printer 1.0 (Print share/Direct)
Apple ImageWriter 7.0.1 (Serial/Direct)
Apple ImageWriter LQ 7.0.1 (Serial/Direct)

HP DeskWriter 3.9
HP DeskWriter C 3.0
HP DeskWriter 550C 2.0
HP PaintJet 3.07a

ClarisImpact and ClarisWorks: Filled Patterns May Make Value Labels Unreadable

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
Charts created with a pattern fill (especially a "hatch" pattern) may make the value labels unreadable on screen and on printout. This could happen with any of the Chart types value labels including percentages in slice with a PIE Chart.

When printing with the Color/Grayscale print option turned on, the percentages will be shown in white. When printing with the Black & White print option turned on, the values will be displayed in black. In both cases the numbers will be difficult to read if an alternating white and black pattern fill is used.

Some Things You can Try:

1. Try changing the font size or style so that the label value is more readable. In order to change the font or style it is necessary to first select the Series box in the Legend corresponding to the slice, bar , etc. that has the value you wish to change. A white circle will appear in the center of the Series box indicating that it is selected. At this point you can choose any font, font size or style and the label value will change.

2. A less desirable choice would be to not use your preferred pattern. Use a solid fill or a pattern fill that does not alternate from white to black.

ClarisImpact: Documentation Error on Connectors: UG Page 1-18

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.

On page 1-18 of the ClarisImpact User's Guide there is a table describing the different types of drawing tools. The definitions for Straight Connector and Right-angle Connector are incorrect. They should be as follows:

Straight Connector: Draws a straight connecting line between two objects.

Right-angle Connector: Draws a right-angle connecting line between two objects.

NOTE: Connector lines are intelligent lines that connect objects. If you move an object, the connector line automatically reshapes to accommodate the change in placement. Connector lines can be drawn with the drawing tools and are one of the main components in an Organizational Chart and a Flow Chart.

ClarisImpact: Error in Help System - Linking Text Frames

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
The ClarisImpact electronic Help section regarding linking text frames is misleading because there is a missing step. Between steps 2 and 3 there should be another step to select the Arrow tool.

To locate this mistake in electronic Help:

1. Choose Help from the Apple menu.
2. Click once on the Keyword button.
3. Scroll till you find "Linked Text Command" and click once on it.
4. To the right will appear the text "Linking Text".
5. Once you click on this word the Help section will appear with the missing step.

DAL: RMS, VAX Rdb, & VAX DBMS Support Q&A

I have some questions about Data Access Language (DAL, formerly known as "DAL") that I need help with:

1. Is Rdb a relational database product that DEC ships free with VMS? Currently, DAL supports Rdb files (that is, you plug it in and play).

2. Is RMS an older relational file structure supported by third-party products like DATATRIEVE. When will DAL support for RMS files be available?

3. DATATRIEVE seems to be a query/script language for accessing RMS files. Does DATATRIEVE keep its own data files in RMS in such a way that DAL will be able to directly read them, or do we have to run some conversion process?
This article has been archived and is no longer updated by Apple.
VAX Rdb/VMS is the DEC relational database management system. However, only Rdb Run-time is bundled with the VAX/VMS operating system. For Interactive and development use, users still have to purchase separate licenses from DEC. Please check with a Digital Sales Office for more information on this licensing.

VAX Record Management Services (VMS RMS) is not an older relational file structure, but rather it is the data management subsystem of the VMS operating system. In combination with the VMS operating system, RMS allows efficient and flexible storage, retrieval, and modification of data on disks, magnetic tapes, and other devices. Currently, RMS supports three file organizations: Sequential, Relative, and Indexed. It supports both Sequential Access and Random Access for Record Access modes. Currently, DAL does not support accessing RMS files directly.

VAX DATATRIEVE, a query and report system, provides a uniform access method for data stored by RMS, VAX Rdb, and VAX DBMS (a multi-user, general-purpose CODASYL-compliant network database management system). DATATRIEVE is also a
Digital product, not a third-party product. Using DATATRIEVE, users can retrieve or modify data without considering the underlying storage method or physical location of the data. Because DATATRIEVE is only a query and report system, the storage of data is determined by the data management subsystem, like RMS, or a database management system, like VAX Rdb or VAX DBMS. If the data being used by DATATRIEVE is from VAX Rdb, DAL should be able to access it. Accessing RMS files directly is not possible with DAL as stated above. DAL will not be able to access data from VAX DBMS either.

ClarisImpact: How to Change Field Names in Organization Charts

Just how do you change the default names for the fields in an organization chart?

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.

Q. I am currently using Element Styles to edit or add a field to a Position in an Organizational Chart but I cannot figure out how to change the name of the fields. I can put a new field on the Position but I cannot give it a new name.

A. Field names are not changed in Element Styles. To change a field name choose Level Settings... from the OrgChart menu. In the resulting dialog box you will see a section for Default Values. Pop-up the menu in that section and choose Field Prompts.

The resulting dialog will let you modify field names.

NOTE: It is not possible to add a new field. You can only modify the field names that are already listed.

ClarisImpact: Models Don‘t Convert When Using Save As

I created an Outline in ClarisImpact and then saved it as a Word document. When I opened the document in Word there was no Outline. In fact, there was nothing at all. What am I doing wrong?

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.

You have created an Outline Model. Because Model frames in ClarisImpact are in a custom proprietary format, if you save directly to a Word Processing format, it is likely that the format does not support these special items. In this case, Word does not understand what the frame contains.

Solution:
Use the "To Outline" feature in the Report environment. This actually converts your Report document into an Outline document. This Outline will open in Word or any other word processor without the bullets but with all the properly indented tabs and text.

NOTE: The "To Outline" feature is available from the Text menu.

No Models will convert to a foreign file format, because no other product directly implements the features of ClarisImpact.

ClarisImpact and ClarisWorks: Preferences Apply Only To Current Document

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.

When you use the Preferences command in the Layout menu, you are choosing specific preferences for the current document. Those preference selections have no effect upon other documents in ClarisImpact or ClarisDraw.

If you choose the "Make Default" button in Preferences, you will create a ClarisImpact or ClarisWorks Preferences file in the Preferences Folder in your System Folder. That file will be used by ClarisImpact or ClarisWorks whenever you create a new document, but the Preferences file is only referenced by these programs when a new document is created; changing those preferences, even if you choose "Make Default," will not make any changes to already-existing documents.

If there is no ClarisImpact or ClarisWorks Preferences file, these programs will use its built in defaults to assign settings to new documents.

The ClarisImpact or ClarisWorks Preferences file will be accessed normally by ClarisImpact if it is located in the Claris folder in the System Folder, the Preferences Folder in the System folder, or in the ClarisImpact or ClarisWorks Folder where the application is located.

Another method for saving settings for new documents is to use stationery. Consult page 2-27 in the ClarisImpact User's Guide or page 2-20 of the ClarisWorks 2.0 User's Guide for details.

ClarisImpact: Page Setup problems with StyleWriter and Apple Color Printer

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
This issue is fixed in ClarisImpact 1.0v2. Call Claris Customer Assistance at 408-727-8227 to obtain a free copy.

Normally when the Paper Size or Scaling Percentage (%) is changed in Page Setup the document changes on screen so that you can visualize what will eventually print. Paper Size and Scaling Percentage changes do not change on screen when using the StyleWriter, StyleWriter II or Apple Color print drivers with ClarisImpact. Even though ClarisImpact will not show any visible changes on the screen, printout will be reduced or enlarged to meet your Page Setup scaling specifications.

All other print drivers will correctly display any changes to Scaling Percentage on screen and printout. The ClarisImpact Development team is aware of this issue.

Easy steps to reproduce issue:
1. Create a new Drawing document.
2. Zoom down to 25%.
3. Choose a LaserWriter driver from the Chooser.
4. Change the Page Setup Scale percent to 50%.

Notice that the document size changes.

Now repeat the above steps but change step 3 so that you are using a StyleWriter driver instead. Notice that the Page Size does not change. Again, this issue is only visual. Printing the document will result in a document 50% smaller.

ClarisWorks and ClarisImpact: Sixteen Color Setting in Monitors Causes the Highlight Color to Become Corrupt

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
How to recreate the issue:

1. Under the Control Panels, select Color, and choose Purple as the Highlight color.
2. Also under the Control Panels, select Monitors and reset to sixteen colors.
3. Open or go to ClarisWorks or Claris Impact.

Workaround:
1. Set your highlight color to either the Yellow or Grey setting in the Color Control Panel's menu OR
2. Select "Other" from the menu and then select a color in the OUTER ring of the color wheel.

NOTE: This occurs in ClarisImpact 1.0, ClarisWorks 2.0 and 2.1. It does not occur in ClarisWorks 1.0.

LaserWriter: How to Change the Manual Timeout

I want to change the manual-feed timeout on a LaserWriter IINT. I read the Tech Info Library article "LaserWriter Timeout Specifications", which states that this can be done and refers you to the "PostScript Language: Reference Manual". Because I'm no PostScript expert, I would like to get a PostScript program that changes the manual-feed timeout to 120 seconds.

This article has been archived and is no longer updated by Apple.
Changing the timeout is done with the "setdefaulttimeouts" PostScript operator. This operator establishes the default values, job, manual feed, and wait for the three timeouts. At the beginning of each job, these values are used to initialize the job, manual feed, and wait timeouts. Each parameter must be a non-negative integer denoting the length of a timeout in seconds. The value of 0 indicates that the corresponding timeout should never occur. The default values for job, manual feed, and wait are 0, 60, and 30, respectively. A PostScript program, like the one that follows, can be sent to the printer to change timeout values:

```
serverdict begin 0 exitserver
statusdict begin
# # # setdefaulttimeouts
end
```

where # # # should be replaced by the job, manual-feed, and wait-timeout values in seconds. In your case, you want to change the manual-feed timeout to 120 seconds and keep the other values the same. You third line should look like this:

```
0 120 30 setdefaulttimeouts
```

The PostScript program then can be downloaded to the printer using a download utility, like Widgets, that comes with the CE Software DiskTop Utility. For more details, search the Technical Info library under "CE Software, Inc.."

Rotated Objects Print Incorrectly with the LaserWriter 8.x Printer Driver

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
When printing using the LaserWriter 8.0 or 8.1.1 printer driver, some objects may be rotated in an odd way. Drawings which printed properly with previous printer drivers will look askew with these two LaserWriter drivers.

This issue has been fixed with the LaserWriter 8.2 driver. (Please see the notes that come with this driver version.) Upgrading to the LaserWriter 8.2 driver is the best solution to this issue.

Since the objects in a document and their placement determine whether you will experience this issue, knowing how to create a document which exhibits the symptom, is central to knowing the workarounds. Here are the steps to recreate such a document:

1. Create an ellipse, arc, round-cornered rectangle, or in MacDraw II, MacDraw Pro or Claris CAD, a rectangle
2. Create a polygon
3. Draw one or more objects
4. Rotate the object you created in step 1
5. The polygon you created in step 2, and any object created after that, will be rotated to the same angle as the object you rotated in step 1

This issueinvolves the relative stacking order of the object in step 1 to the object in step 2 (the polygons need to be stacked "above" the rotated object for this to occur).

Workarounds:

- Move all poly-based objects (polygons, bezigons, etc.) to the back of the document
- Alternatively, if possible, move objects other than poly-based ones to the front
- Go back to using the LaserWriter 7.x driver

Additionally, you could also

-Save the document in EPSF format, re-open the EPSF file, and print that in its entirety

The symptom can occur when printing the document in the foreground or background, with either Postscript Level 1 or 2.

Also note that this issue isn't confined to MacDraw II, MacDraw Pro, Claris CAD, or Claris products in general. The issue has been found to occur when printing from other programs such as Microsoft Word, Microsoft Excel, Microsoft PowerPoint, ResEdit, PICT Detective, Canvas 3.0 and Canvas 3.5.

ClarisWorks and ClarisImpact do not exhibit this issue.

Interesting technical sidelight: in step 1 of the procedure above, the instruction calls for you to "create an ellipse, arc, round-cornered rectangle, or in MacDraw II, MacDraw Pro or Claris CAD, a rectangle." The reason for the difference with MacDraw II, Pro and Claris CAD, is that these products all internally "tell" the printer that a rectangle is actually a rounded rectangle - with the radius of the corners set to zero. So MacDraw and Claris CAD will exhibit this behavior, even with a rectangle, while other draw applications may not.

ClarisImpact: Very Wide Spacing Between Letters on Printouts

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.

You may see VERY wide spacing (1/8 to 1/3") between characters when you print from ClarisImpact if you are using an old version of the Hewlett-Packard DeskWriter driver. Upgrading to anything beyond 2.x will fix this issue.

A temporary workaround until you obtain a new driver from HP is to copy and paste your work into a new ClarisWorks document. Print from the new document.

To get the current HP Driver, you can do any one of the following:

- Call the HP Driver Update number directly at 303 353-7650.
- Fax your request to 303 335-7655 Specify the driver version you are currently using, your printer name and type, your name address and daytime phone number.
- Use the "HP First" Fax answer line (similar to ours). It can Fax you back a driver request form - call it at 800 333-1917 with your Fax number ready to key in.

ClarisWorks and ClarisImpact: Adding Durations in Minutes to a Start Time (SS)

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
Given a start time in A2 and two duration times in B2 and C2 expressed as number of minutes, the formula for end time would be:

=A2+B2/1440+C2/1440

Use the Number command in the Format menu in ClarisWorks or the Number Format command in the Table menu in ClarisImpact to set the end time cell to display as time rather than a decimal.

Times are expressed internally as a decimal value in ClarisWorks and ClarisImpact, with midnight being equal to 1 and noon to .5. The number of minutes in a day is 1440 which we used here to reduce minutes to a fraction of the day so that we could add it to the start time.

ClarisImpact: Creating Conditional Loops using the Flow Chart

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
It is possible to create a conditional loop using a Flow Chart, but you cannot do it with the Add Element controls (the arrows that appear when you click on a Symbol).

To add the arrow between the Symbol titled "1D" and the Symbol titled "1A" it is necessary to draw the connector manually. Follow the steps below:

1. Click on the Symbol until the Add Element controls appear
2. Click and hold down in the center of that Symbol.
3. Drag to the center of the Symbol you want to connect.

The connector created will be just like the connectors created with the Add Element controls.

This solution will not work with an Organization Chart.

ClarisImpact: Data in Table does not Appear to Copy and Paste

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
The first column of a Table using the Traditional Model Style is formatted with white text. If you try to copy and paste the data from the first column, it will appear NOT to paste.

Solution:
Change the text color before you copy or after you paste.

ClarisWorks: Text Wrap Near the Right Margin Causes Line Spacing To Revert To Single Spacing

This is an issue exclusive to ClarisWorks 2.1v2.

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.
ClarisWorks version 2.1v2 has a known issue when formatting an object with the Text Wrap option. If the object is located at the right margin of the document, the text which is actually effected by the text wrap option will revert to single line spacing.

If you paste the graphic inline or move it to the left margin, it will work fine.

This issue is fixed in 2.1v3 and 3.0.
Published Date: Feb 18, 2012

Updating to ClarisWorks 2.1v2 Generates The Alert, "This document uses fonts not installed in your system."

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
This has been fixed in ClarisWorks 2.1v3 and above.

Claris has confirmed that some customers may see the following alert, "This document uses fonts not installed in your system." This alert may occur upon opening documents created with ClarisWorks 2.0 with their updated ClarisWorks 2.1v2.

The alert lists the "missing" fonts by number. Clicking OK opens the document and shows the fonts that were reported missing. This has happened on systems where no fonts have been installed or deleted. Therefore it seems that the alert is erroneous.

Claris Engineering is aware of the issue.

Functionality of Demi-cercles And Rayon In ClarisWorks 2.0Fv1 Is Switched In The Rectangle (Arrondi d‘angle) Dialog Box.

Rayon functions as expected if you choose Demi-cercles and enter the points into the Rayon point field.

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.

There is a problem with the Rectangle dialog box in the French version of ClarisWorks 2.0. The dialog, Arrondi d'angle, appears similar to the US version, with it's corresponding dialog for Rounded corners. However, the option, Demi-cercles, which should correspond to the Round ends in the US version, actually functions like the Radius. Rayon, functions as Rounded corners in the US version. The field for entering the points of the Radius positioned adjacent to Rayon, does indeed relate to Rayon (Radius), but will not have an effect unless Demi-cercles is selected.

The issue is apparent when you take the following steps...

1. Launch ClarisWorks 2.0Fv1 and Open a Draw (Vectoriel) document.

2. Using the Rectangle tool, create a rectangle.

3. Click twice on the object to bring up the Arrondi d'angle (Rectangle) dialog.

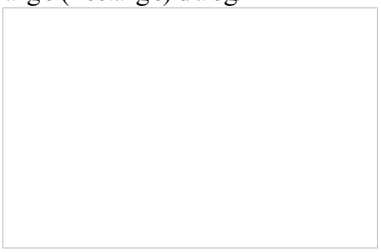

Figure 1

Claris Engineering is aware of the issue.

Issue with Apple‘s ProDOS Extension When Saving ClarisWorks Files as AppleWorks Format (WP)

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
Apple now ships a ProDOS extension that allows you to mount a ProDOS disk onto a Macintosh desktop. It also allows the transfer of files between a ProDOS and Macintosh computer system. Previously this was only possible using Apple File Exchange (AFE).

Unfortunately, the ProDOS extension does not work properly when using it to transfer an AppleWorks file to an Apple II or IIGS, if that file was created in ClarisWorks and saved as AppleWorks format.

1. If you save your ClarisWorks word processing file as an AppleWorks 2.0 file directly to your Macintosh hard drive, and then drag the file from the hard drive to a ProDOS diskette, the file will not open on an Apple IIe or Apple IIGS. In this procedure, the ProDOS extension loses the file type information. Normally the file type should be $1A but ProDOS changes it to $00. If you have an Apple IIGS you could use a Disk Editor to change the file type back to $1A, but in the case of an Apple II there is no workaround, except to use AFE to transfer the file instead.

2. If you save your ClarisWorks word processing file as an AppleWorks 2.0 file directly to your ProDOS diskette the file will be not be readable on any ProDOS machine. In this procedure, the ProDOS extension does save the file properly. The only workaround is to use AFE instead.

NOTE: If you have the ProDOS extension running while using AFE, then AFE will also fail to transfer the file properly. Remove the ProDOS extension and restart your computer before using AFE.

Another workaround:
Save your ClarisWorks files as a text file instead and import the text file into AppleWorks. The ProDOS extension will work properly with plain text files. The disadvantage to this method is that you will lose all formatting characteristics such as bolding or margins. Most importantly, though, the text will transfer.

ClarisWorks: Spreadsheet Data "Disappears" When Inserting or Deleting a Header or Footer

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.

Question:
Some of my spreadsheet disappeared when I inserted a Header/Footer. How do I get it back?

Explanation:
Whenever you insert a Header/Footer or remove a Header/Footer, ClarisWorks automatically turns on Page View so that you can see the Header/Footer, or see that it is gone.

Page View only shows the Print Range since it is like a Print Preview. This may make some of your spreadsheet seem to disappear, if a Print Range of specific cells has been chosen instead of the default "All cells with data".

Solution:
Under the View menu notice that there is a checkmark next to Page View. Choose Page View to turn off this feature.

Another solution would be to change your Print Range to include the portions of the spreadsheet you want to see. Choosing "All cells with data" will ensure that all of your spreadsheet will always show on screen and print. Print Range is found under the Options menu.

ClarisWorks: Can‘t Access the Error Correction Settings in Apple Modem Tool Dialog (CM)

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.

ClarisWorks 2.1 comes with a new Apple Modem tool which offers modem error correction controls. If you select your modem from the popup menu and these controls are disabled, your modem does not support error correction. If your modem is not listed in the popup menu, you can create your own modem settings by selecting Custom.

To get access to the Error Correction settings in the Apple Modem tool 1.5 connections dialog:

1. Choose Hayes compatible from the popup menu (Settings menu, Connection Settings)
2. Then select Custom from the same popup menu.
3. Click the checkbox for "Modem supports software error correction." If you modem supports hardware error correction, also click the hardware checkbox.

You will then have access to the Error Correction popup menu. Selecting Optional or Required from that menu will enable the Correction Type popup menu which offers options for Software MNP or hardware.

ClarisImpact: Need to Select SYLK File Type in Order to Import SYLK Files

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
SYLK files will not import correctly into a ClarisImpact Table if the file type "All Available" is used. ClarisImpact will use a Text or ASCII translator unless the Show menu from the Place File... dialog box is changed to "SYLK".

Normally, Claris products can take a quick look at the header of the file and pick the correct translator instead of requiring the exact translator to be chosen.

Outline Levels Not Retained When Pasting from ClarisWorks Into ClarisImpact - Use Open or Place File Instead (WP)

ClarisWorks outline levels are not retained when copied via the clipboard and pasted into a ClarisImpact outline frame. All outline items paste in as level 1 paragraphs.

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.

To bring a ClarisWorks outline into ClarisImpact with levels intact, save the ClarisWorks document and use the Open (to create a new document) or Place File (to insert into an existing document) commands in ClarisImpact.

Published Date: Feb 18, 2012

ClarisImpact: Placing a File into a Timeline

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.

Timelines have the ability to show many columns of information such as Planned Start, Duration, etc. through the Data Display menu choice. You might think if a column is not showing on screen then that column will not be used during import (import refers to using Place File... or Copy/Paste). Unfortunately, this is not true. That is why column order is so important when importing. The import order (same as display order) is listed below:

1. Task Name
2. Planned Start
3. Duration
4. Latest Finish
5. Actual Start
6. % Done
7. Actual Finish

ClarisImpact imports into all columns whether they are showing or not. As a general rule, your text file should contain 7 Tabs-worth of data (one for each column of data, whether or not the column is displayed in the table). For any columns for which you do not have actual data, it is still necessary to have a Tab of blank data in your text file. The only exception is when the blank columns occur at the end. For example, if you want to import into the first three columns but not the last four then you do not have to include tabs as space holders for the last four columns.

Also, remember to make sure the data you are importing is of the same data type as the Timeline columns. If you are importing into a Date column then make sure the data you are importing is of date format. Generally, the Timeline will just not import the data if it is of the wrong data type (thus leaving a blank column after import). The same thing could happen if you do not properly match up your Timeline columns with your import data.

Lastly, Place File... will not create new rows if the import data uses more rows than are currently in your Timeline. Always create enough rows when Placing data into a Timeline. Copy/Paste will create new rows if they are needed.

NOTE: The Data Display dialog is incorrect because it switches the above order for "% Done" and "Actual Finish".
Published Date: Feb 18, 2012

ClarisImpact: Cannot Change Date Formats in Timeline

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.

Two of the five Date Formats available for Timelines will sometimes not allow the modification of a date in the Planned Start, Planned Finish, Actual Start or Actual Finish column (even if the date is accurate). Date format options appear in this order from the Date Format... dialogue box:

6/11/95
Jun 11, 1995
June 11, 1995
Sun, Jun 11, 1995
Sunday, June 11, 1995

The top three formats do not cause any problems. The last two formats will sometimes not allow modification, indicated by a beep but NO error message. The beep simply means ClarisImpact will not accept what you are entering.

Workaround:
All of the date formats except for the first choice are not meant to be edited. When changing a date, do not just modify the day or year, retype the entire date in the format mm-dd-yy instead of the long format (once entered, ClarisImpact will automatically reformat to the long version of the date).

NOTE: Although the last 4 date formats are for display only and not meant to be modified in their long form only the last two date formats will cause problems. Therefore it is safe to edit the first three date formats in long form but not the last two.

The ClarisImpact Development team is aware of this issue.

Macintosh and Distributed-Session Controllers (8/94)

IBM has an SDLC card that distributes 3270 series sessions over IBM's implementation of Token Ring.

1) Is there software for the Macintosh that lets the Macintosh get a session from the SDLC card over Token Ring?

2) If yes, can the Macintosh be bridged to Ethernet or LocalTalk and get a session through that topology?

This article has been archived and is no longer updated by Apple.
There is no software available at this time that lets a Macintosh connect to a distributed-session controller, like a PC with an SDLC card. Essentially, the ability to accept one of the distributed sessions from an SDLC interface requires software that is not yet available on Macintosh. Our only solution is the expensive route of using a true 3174 or compatible controller, or SNA Gateway product and terminal emulation.

You can also talk to Tri-Data, DCA (formerly Avatar), and Wall Data. All of these companies can address the needs of distributed 3270 sessions (Wall Data can also use the Serial NB Card). The Macintosh SE, Macintosh SE/30 and Macintosh II systems can use distributed SDLC sessions through an Apple Network System products, like Avatar MacMainFrame, Tri Data Netway 2000, Wall Data SNA*ps, or Andrew NetAccess. Note however, that these products do not provide a true solution, because there are no Apple or third- party products that use NetBIOS distributed SDLC sessions over Token Ring as implied by the request and are limited to a set number of sessions available for distributing.

Given the use of the third-party products listed here, it is also possible to acquire sessions across different network topologies through the use of routers, as in the case of an Apple Internet Router supporting LocalTalk installed with an Ethernet card or Token Ring card.

Article Change History:
30 Aug 1994 - Updated with additional third-party offerings.
26 Jul 1993 - Company title changed from Avatar to DCA (Digital Communication Associates).
23 May 1990 - Updated for technical accuracy.

ClarisWorks: Color ANSI and VT420 Communications Tool

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
ASC makes a terminal tool which supports VT420 and PC-ANSI graphics. Informal testing indicates that the tool is compatible with ClarisWorks. The tool adds color ANSI graphics support.

Below are the file description and Read Me file for the demo tool available in the Claris forums and Claris BBS. The demo version supports sessions up to 8 minutes long. If you decide to use the tool, you can purchase a fully functional version from ASC.

DEMO FILE DESCRIPTION

Enclosed is vt420 and PC-ANSI terminal tool for the Communication Toolbox (CTB). The CTB is part of your system if you run Sys 7 or later an can be installed on Sys 6.0.4 or later.

This tool offers full color support (also in vt mode), ANSI graphics, speed, drag & drop keyboard mapping and much more....

When used with 5PM Term or 5PM Pro from ASC it also offers full Printer Support by re-directing terminal printer stream to your local or LAN connected Macintosh Printer.

The tool can be used over LAT, modem, serial, ADSP and TCP/IP (with our telnet tool called TCPack).

The demo can also be downloaded from Internet at netcom.com anonymous FTP path "pub/ascus/".

DEMO INSTALLER READ ME

This Installer will install :

asc420/ANSI Terminal tool for DEC-VT420 and PC-ANSI emulation.

Installation Procedure

The Installer requires that you run Apple's System version 6.04 or higher.

If you run System 6.x, make sure that you have installed Apple's Communication Toolbox before using this Installer.

The connectivity tools will be installed into your active "Extensions" folder if you are running System 7 or higher or into your active "Communications Folder" if you are running System 6.x.

Fonts Installation Procedure

On System 7.1 or higher the Installer will copy the required fonts into your active "Fonts" Folder.

For older systems the fonts will be put into a folder called "Fonts - Put into System" located on the same level than the 5PM Pro and 5PM Term applications.
You will then have to copy these fonts into your "System" file using the "FontDAMover" application if you are running System 6.x or by dragging them onto your System file or folder if you are running System 7.

Required Third Party Products

Some of the ASC products require some third party software or hardware in order to be used.
This third party software is not provided with this demonstration version for legal reasons.

Most of the third party drivers are however provided with the commercial product.

The following third party products may be required to fully test the enclosed products:

Communications Toolbox

Apple's Macintosh Communications Toolbox is required to be installed in your system before you install ASC products. If your Macintosh is running version 6.x of the System Software you will have to make sure that the Communications Toolbox is installed. The Communications Toolbox is already integrated in System 7 or higher.

MacTCP

Apple's MacTCP driver is necessary in order to test our TCP/IP related tools TCPack and FTPack.
Version 2.0.2 is recommended by Apple for use with System 7.1. It is fully compatible with System 6 and 7.

LAT

LAT connectivity is shipped with the commercial product, but not included with this demonstration version. LAT connectivity for the Communications Toolbox can be purchased from APDA.

The Connectivity Environments

Our Environments are a collection of tools and drivers which allow you to connect to the host environment of your choice. Remember that these environments might also work for configurations of which they do not bear the title. We are working on new environments, and are open to suggestions to help us serve you better.

UNIX/VAX

This environment allows you to connect to UNIX and VAX type systems, using VTxxx terminal emulation. The asc420 terminal tool is capable of emulating VT400, VT100, VT220, VT320, VT52, as well as PC/ANSI and VT100-AU/X. It allows you to connect to almost any type of UNIX system, as well as many of the bulletin boards and mail services. Connections can be made using TCP/IP, LAT, ADSP, serial connection as well as via almost any modem. Files can be transferred to and from the host using FTP or simple XModem. Other connections or file transfers (such as DECNet or Kermit) can be made by using other existing third-party tools.

IBM Mainframe

This environment allows you to connect to IBM mainframe systems, using IBM-3270 terminal emulation. The asc3270 terminal tool is capable of emulating IBM-3278 Models 1 through 5, as well as IBM-3279 Models 2 and 3. It allows you to connect using either SNA or TCP/IP to IBM computers running systems such as VM/CMS, MVS/TSO and CICS/VS. Files can be transferred using IND$File or FTP.

AS/400

This environment allows you connect to IBM AS/400 systems, using IBM-5250 terminal emulation. The asc5250 terminal tool is capable of emulating IBM-3477, IBM-3179, IBM-3180, IBM-3196, IBM-5292, IBM-5291, as well as IBM-5251. It allows you to connect using either SNA or TCP/IP. Files can be transferred using FTP or the Text file transfer tool.

Demonstration Version Validity

All ASC products provided with this Installer will be fully functional until March 15, 1994. After that date the basic demonstration will allow you test the product for sessions not exceeding 8 minutes.

If at that stage you would like to extend your evaluation period, please contact us :

ClarisImpact: How to Duplicate a Slide

There is no feature for duplicating a slide. The best method is to copy and paste the information. More detailed instructions are below.
This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
If you are trying to duplicate the entire slide then follow these directions:
1. Click on the Arrow tool.
2. Choose Select All from the Edit menu.
3. Choose Copy from the Edit menu.
4. Create a New slide.
5. Click on the Arrow tool.
6. Type the Delete key once (to delete what is on the current slide).
7. Choose Paste from the Edit menu.

NOTE: If are copying the entire slide, it may be advantageous to try the Master Slide feature, covered in Chapter 14 of the ClarisImpact User's Guide.

If you just want to copy the data in the Body or the Title, follow these instructions:
1. Click into the Title or Body section until the blinking cursor appears.
2. Choose Select All from the Edit menu.
3. Choose Copy from the Edit menu.
4. Create a New slide.
5. Click into the Title or Body section until the blinking cursor appears.
6. Choose Paste from the Edit menu.

MacDraw Pro: Large Arcs Will Not Print on LaserWriter

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
If you make a drawing that spans several pages and draw an arc over 53 inches long, the arc, and anything on the page with the arc, will not print using LaserWriter print driver 7.2. The 8.1.1 driver will print a small portion of the arc, rotated at an undefined angle.

The solution is to group the objects together and scale the selection to 25%. Change the page setup to 400% (you may have to relocate the drawing to print on the page where you want it) and then print.

ClarisImpact: All Flow Chart Symbols Not Available

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
Easy Install installs all files from ClarisImpact, but the full set of Flow Chart Symbols is not automatically available.

Following is an explanation from the Read Me file included with ClarisImpact:

The "ClarisImpact Color Styles" and "ClarisImpact B&W Styles" folders contain a second set of Flowchart files located in the folder named "Full Flowchart Styles". These files contain the same Basic and Computer Network model and element styles that are in the first set of files and include the rest of the style families - Business, Deco, Informal, International, Modern, and Traditional.

To use these styles, replace the "Flowchart Symbols" and "Flowchart Style" files in the "ClarisImpact Color Styles" or the "ClarisImpact B&W Styles" folders with the files in the "Full Flowchart Styles" folders. Note: if you have customized the original files, rename or make a copy of them before they are replaced.

ClarisImpact: Cannot Copy and Paste Date from Table to Timeline

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.

It is not normally possible to copy and paste a date from a ClarisImpact Table into a ClarisImpact Timeline date cell. While ClarisImpact will allow you to paste the date, it will beep at you and change the date back to the original when you try to move to another cell. This is because ClarisWorks and ClarisImpact store dates internally as serial numbers.

This does not happen when pasting into a Time line date cell that is empty and has never had a date entered into it.

If you copy a text date value from the ClarisImpact Table (where you enter ="3/1/94"), it will paste without a problem.

Also, =DateToText(Date(Year(A1), Month(A1), Day(A1))), entered into A2 (or any other cell), gives a result that can be copied from A2 and pasted into a timeline date cell.

Other programs work fine when copying and pasting a date to a ClarisImpact Time line. One example would be FileMaker (actually, if it is a calculated date copied from FileMaker to a ClarisImpact Time line it will also not work). ClarisWorks Spreadsheet dates also copy and paste fine.

ClarisImpact: Changing Connector Styles

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
Right angle connectors and straight connectors are actually two different kinds of objects, like circles and squares are different kinds of objects.

Unlike circles and squares, however, you can change the connectors from one type to another.

For connectors drawn with the connector drawing tools or in a Flow Chart: Select the connector you wish to change (see below) and go under the Layout menu to Connectors... Just click the kind of connector you wish to change to and hit the OK button.

For connectors in an org chart, select the connectors you wish to change and go under the OrgChart menu and select Connector Settings... Make the changes you would like and hit OK.

To select the connectors, simply click on the connector line itself. To select multiple connectors, hold down the shift key and click on the connectors you wish to change. To select all connectors, go under the Edit menu and choose Select All, or hit Command-A.

ClarisImpact Performs some Operations very Slowly using TimesTwo

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
Certain operations in ClarisImpact could slow down dramatically if TimesTwo file compression is installed.

There are several different compression technologies in use today. The two most common are "File Compression" utilities and "Driver Compression" utilities. File compression utilities give you more space on your hard disk by making each file smaller. Driver compression utilities give you more space on your hard disk by telling the hard disk drivers that there is more space available to store files.

TimesTwo is a driver compression utility, while AutoDoubler and Now Compress are two products that compress your files rather than your drivers.

ClarisDraw, Impact: Clip Art Provided Can be Ungrouped

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
All the Library art provided in the Claris Art folder has been designed for easy modification. Most objects have several levels of grouping so that you can modify some parts and not others. For example, all of the signs in the Road Signs Library will ungroup so that you can change the name on the sign.

To ungroup an object:
1. Select an object with the arrow tool so that the square selection handles show on each corner of the object.
2. Choose Ungroup from the Arrange menu.

Each object that has selection handles on it can now be individually modified. After you have modified one of the pieces you can regroup the object.

It is also possible that the graphic has several layers of grouping. For example, try ungrouping one of the World Maps, specifically the map of Africa. The first ungroup will separate the map of Africa into 5 layers:

Top Layer = Country Names
Second Layer = Outlines of Countries
Third Layer = Outline of Continent
Fourth Layer = Black filled Outline of Continent
Bottom Layer = Drop Shadow of Continent

If you next select the Second Layer and ungroup it you can remove just one or several countries from Africa and work with them individually.

Finder Menu Overlaps ClarisWorks Menu - French Version

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
Launch ClarisWorks (preferably in English, so you can see the two different menus in different languages), create a document, save it. Go to the Finder, click on the document, and under the File menu, choose Open. You will see that the word "Fichier" overlaps the word "Edit" in the English version and "Edit." in the French.

When working with the French version, it seems (incorrectly) that the "Fichier" is the application menu, not the Finder's; therefore, one is given the impression that the application menu has been altered.

This is a known bug.
Published Date: Feb 18, 2012

ClarisImpact: Incompatibility with Square One

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.

Square One, a utility for launching files and applications, is incompatible with ClarisImpact. Launching ClarisImpact with Square One bypasses the New Document dialog and just shows two ClarisImpact menus: File and Edit. You can then choose New from the File menu to bring up the New Document dialog, but there is no Open... button as there should be.

Published Date: Feb 18, 2012

ClarisImpact: Items Resize in Creation Order

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
Items being resized using the resize icons in the Alignment palette will be resized to the dimension of the object drawn first.

To reproduce the problem:

1) Draw a small rectangle and then a large rectangle.
2) Select both and hit one of the resize icons on the Alignment palette.
3) Note that the dimension used is that of the small rectangle. It was drawn first.
4) Undo.
5) Lock the small rectangle.
6) Select both and hit the resize icon.

ClarisImpact will beep and no resizing will occur.

There are no workarounds.

ClarisImpact and Draw: Listing of Useful Libraries for Creating Maps

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
There are several Libraries in ClarisImpact and ClarisDraw that are ideally suited for making maps. They are listed below:

Common Symbols
Map Symbols
Road Signs - USA
Transportation
Trees and Shrubs
USA
World Maps 1, 2, 3 & 4

These libraries could be used to make maps for a school project, for a business presentation or for a map to your house.

Picture Libraries are located in the Claris Art folder, if you have performed a complete installation of ClarisImpact or ClarisDraw. If they are not present, use the installation disks to install them.

NOTE: in order to connect roads easily, keep Auto Grid turned on.

ClarisImpact: Making an Outline with the Same Text Size on Every Level

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
All of the outline styles that ship with ClarisImpact are set to have different text sizes on different levels. You can easily change that so that all of the levels have the same text size, and save it as a model style to use over and over.

To make the text the same size on each level:

1) Create an outline
2) Go under the Outline menu to Level Settings.
3) In the Level Settings dialog, hit the Select All button. This highlights each level.
4) Set the size to your desired point size.
5) Hit Done.

To save the style:
1) Go under the Outline menu to Model Styles.
2) Hit the Add button.
3) Type in a name for your new style.
4) Hit Rename.

Now, each time you make a new outline, ClarisImpact will bring up your style as an option.

ClarisImpact: Objects have Different Rulers

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
All objects created in ClarisImpact can have their dimensions displayed and modified through the Object Size... palette under the Arrange menu. These dimensions can display in inches, millimeters, centimeters, picas and points and are based upon the ruler settings (the unit of measure can be changed by choosing Rulers... from the Layout menu).

The issue occurs when you change the unit of measure in the middle of a drawing. The dimensions displayed in Object Size... will not be converted to the new unit of measure on any existing objects. All new objects will display the new unit of measure. Try this example:

1. Create a new Drawing document.
2. Create a rectangle.
3. Choose Object Size... from the Arrange menu. Notice that the dimensions for the selected object are in inches.
4. Choose Rulers... from the Layout menu and change the unit of measure to millimeters and then click the Okay button.
5. Draw a new rectangle. Notice that the dimensions for this object are displayed in millimeters.
6. Click on the first rectangle and notice that the unit of measure in the Object Size palette changes to inches.

Claris Works reacts differently to the same procedure. When changing the unit of measure all objects are converted to the new unit of measurement.

The only workaround is to redraw the objects that do not have the correct unit measurements.

The ClarisImpact Development team is aware of this issue.

ClarisImpact & Draw: Option-Copy from Illustrator does not Work Properly

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.

Holding the Option key down while copying a picture in Adobe Illustrator allows you to copy PostScript art into another application via the clipboard. Illustrator generates a PICT Preview so that you can see the art on the screen after you paste.

However, ClarisImpact and ClarisDraw print both the PICT Preview and the PostScript art. The PostScript version of the object prints on top of the PICT Preview, so when printed the object may appear to have a jagged edge as if it were a bitmap.

Workaround:
Save your PostScript art from Illustrator as EPSF and import the EPSF into ClarisImpact or ClarisDraw using Place File... from the File menu.

ClarisWorks & Impact: Page/Slide Numbering

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
You can add slide/page numbers to your documents in ClarisImpact and ClarisWorks.

ClarisImpact:
1. Create a new Presentation document
2. Go to the Master slide
3. Create a Text block (Text Model)
4. Choose Insert Slide # from the Text menu

ClarisWorks:
1. Create any type of document (except database)
2. Choose Insert Header or Footer from the Format menu
3. Choose Insert Page # from the Edit menu

Note that you cannot add page/slide numbers to MacDraw Pro or ClarisDraw documents.

ClarisImpact: Placing a Banner over a Graphic on a Calendar Day

You would like to place a graphic on a calendar day or month and then place a banner over it. If you paste the graphic on top of the calendar, click on the banner, and send it forward, the banner will not overlay on top of the graphic. This is because the graphic and the calendar are essentially treated as similar objects.

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.
To send an element such as a banner to the front or back of a graphic, incorporate the graphic directly within the calendar using the style editor. Here are the steps...

- Select the days or months of the calendar you want
- Choose "Element Styles" from the Calendar menu
- Click on "New" in the "Element Styles" palette (if it is not available, click on the down arrow flag to make it visible).
- Create the graphic or paste it into the style editor
- Apply this style to the day or month

Now that the graphic is within the calendar, you can send the banner to the front or back of the graphic.

ClarisImpact: Presentation: Master Page changes

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
When editing the Master Page of a Presentation document you may get the message, "Update all existing Titles and Bodies with the text format and position of the current Master Title and Body?" with three button choices; "Yes", "No" and "Cancel".

1. Clicking "Yes" will update all of your EXISTING slides to conform to the modified Master Slide. This may be problematic if you have changed some of the slides to be slightly different than the Master Slide. For instance, you may have decided to change the Label type of Outline on one slide or maybe the color of a Title on one slide has been changed. If this is true and you click "Yes" then specific slides settings will be erased.

2. Clicking "No" will not update any current slides but will change any new slide to follow the new Master Slide changes. This method is best used when current slides have modified individually. By clicking "No" you will be able to keep changes to existing slides but have the new Master Slide apply to all new slides that are made.

3. Clicking "Cancel" will discard all new changes made in the Master Slide.

Hints for creating slides:
When creating slides it is a good idea to think through the presentation first. Determine whether all the slides are going to be based on the same Body and Title or whether they are going to vary. In this way you will be able to use the information in this article to plan your strategy better.

NOTE: Only changes to the Body or Title in the Master Page will cause the above message to appear. This might be caused by the movement of the Title or Body or by the changing of the text attribute in the Title or Body. Making changes to the background color of the Master Slide will not cause this message to appear.

ClarisImpact: Rotated Table Model only prints Outline of Model to DeskWriter

Printing a rotated Table Model in ClarisImpact to a DeskWriter will only print an outline of that Table. You will also receive a message saying that there is not enough memory to complete the job.

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.
Use a custom Model or the Basic Style Model. All other Model Styles will not print correctly to a DeskWriter when rotated.

NOTE: This printing issue has been tested with all versions of the DeskWriter driver including the newest 5.0 version. All other printers work fine with rotated Tables.

Steps to re-create:
1. Create a Table Model in the Draw environment using any Model Style other than Basic.
2. Rotate the Table 90 degrees.
3. Print to a DeskWriter.

ClarisImpact & Draw: What Connectors can Connect to

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
Connectors only 'connect' to certain points of objects and groups. Below is a list of kinds of objects and the points on them that connectors will connect to.

Lines: endpoints, midpoints
Squares, Rectangles,Notes, Text frames: line endpoints and midpoints, object centerpoint
Circles, Ovals: 3, 6, 9 and 12 o'clock and centerpoint
Rounded rectangles: line end and midpoints, and the endpoints and midpoints of the arcs that make up the corners, and the centerpoint of the rectangle
Smoothed polygons: endpoints and the midpoint of the polygon
Unsmoothed polygons: any control point on the polygon
Groups: Group centerpoint, group cornerpoint, and the midpoints of the bounding rectangle lines of the group
Connectors: Cannot connect
Framed models (tables, data charts, calendars, time lines): Frame endpoints, midpoints and centerpoints of models
Unframed models (org charts, flow charts, outlines): frame end- and midpoints, centerpoints or models

You can connect to other points in a model if you ungroup the model. To do so, cut the model, paste it, and ungroup it. The model will become a graphic object and you will not be able to use any of the model commands or functions, but you will be able to connect to points on the objects.

ClarisImpact: When converting from Outline to Org Chart, how do I get Information into the Title Field?

There is a feature in ClarisImpact that allows you to convert an Outline to an Org Chart. Since an Outline and Org Chart are based on a similar hierarchical structure this method works mostly as expected (See page 4-23 of the User's Guide for instructions).

The only issue the manual does not cover well enough is how to get data from an Outline Topic or Subtopic into a second or third field on the same Org Chart Position (it does mention the following solution on page 9-14 of the User's Guide).

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.
Use a Shift-Return to separate lines within an Outline Topic or Subtopic. When converting to an Org Chart, ClarisImpact will interpret these special returns as the beginning of a new field within the same Org Chart Position.

ClarisImpact: Sharing data with MacProject Pro

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
ClarisImpact Timelines can be created using MacProject Pro data. To share data, follow these steps:

1. Go to any chart in MacProject Pro that can display the columns: Start Constraint, Start On, Start no earlier than, Start no later than, Earliest Start, Finish Constraint, Finish no earlier than, Finish no later than, Finish On, Latest Finish, Duration, Actual Start, Actual Finish and % Done.

2. Organize up to 7 columns in the SAME order as the ClarisImpact column order listed below. If you only want to place one column into ClarisImpact export that one column.

Impact columns are ordered:
Task Name
Planned Start
Duration
Latest Finish
Actual Start
Actual Finish
% Done

3. Export the data in TAB DELIMITED format.

4. Open a ClarisImpact Timeline and place you cursor in the first cell.

5. Display as many (or more) rows as you wish to place

6. Display the columns you wish to place data into.

7. With your cursor in the first cell, select Place fileÉ from the File Menu.

NOTES
If you do not expand the columns and rows to accommodate all the data that is to be placed, only part of the data displays as transferred. Keep in mind that exporting Start and Finish dates from MacProject allows you to create a ClarisImpact timeline that looks very similar to one you create in MacProject, but there may be extra slack or an unmeetable finish that you may need to adjust.Share data MacProject Pro timeline

File Transfer Protocols and ClarisWorks Communications (CM)

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
This is a brief description of several common file transfer protocols. The methods available to you when using ClarisWorks can vary. Currently, the Macintosh Communication Toolbox (which is used by ClarisWorks) ships with tools supporting the XMODEM and ASCII Text protocols only. ClarisWorks 2.x includes the Claris Kermit Tool as well. Tools for other protocols (such as Kermit, YMODEM and ZMODEM) can be attained from online services and distributors.

Mark/Space Softworks sells a ZMODEM tool for $29.95. They can be contacted at (800) 799-4737.

XMODEM/XMODEM-CRC - The BBS supports two variations of the XMODEM protocol, originally developed by Ward Christensen, called XMODEM and XMODEM/CRC respectively. XMODEM offers the advantage of error checking on a block by block basis to assure that the data sent contains no errors. It does this by adding a checksum byte to the end of each 128 byte block of data; the receiver calculates its own checksum and compares it to the one received. If an error is detected in the transmission, XMODEM will request that WILDCAT! retransmit the block of data. In addition to the above checksum comparison, XMODEM/CRC adds another level of error detection using a complex Cyclical Redundancy Check algorithm.

XMODEM and XMODEM/CRC are slow transfer protocols when compared to many others available. They should only be used when your software supports no other protocol. XMODEM/CRC is preferable to XMODEM due to its greatly improved error checking.

1K-XMODEM - This protocol performs exactly like regular XMODEM/CRC, but increases the block size to 1024 bytes, hence the name 1K. It is slightly faster (on fairly clean phone lines) than regular XMODEM due to a smaller number of blocks being sent, and therefore fewer block checks being made.

YMODEM - YMODEM is a protocol devised by Chuck Forsberg of Omen Technology which adds a number of enhancements to protocol based transfer. Block sizes are variable at 128/1024, but 1K is the usual size. Error checking makes use of CRC-16, accurate to 99.99%. By definition, all YMODEM transfers are capable of sending multiple files at one request, with the file size and date included in the "header block" sent prior to each file. YMODEM supports multiple file transfer (both down AND up) of up to 99 files with WILDCAT!.

NOTE: A number of communication programs incorrectly use the term YMODEM but actually send using 1K-XMODEM. This practice is not proper and will result in a failure when used with a true YMODEM transfer as used by WILDCAT!. Use of YMODEM, if supported by a callers software, is recommended over XMODEM and 1K-XMODEM for speed, reliability, and features.

YMODEM/G - This variation of YMODEM is available only to callers making a "reliable" connection using a modem supporting MNP (Microcom Networking Protocol) or the USRobotics ARQ hardware error checking or the most recently introduced correction method, V.42/V.42bis. If a MNP connection is detected, WILDCAT! will add this protocol choice (as well as 1K-XMODEM/G) to the available options.

MNP is a hardware based system in which the modems perform the actual error checking and correction, if needed. The software such as WILDCAT! and Qmodem simply send the information blindly from one system to the other using the protocol for block sorting information only. For this reason, these two protocol choices ONLY appear if a MNP connection is detected at logon.

YMODEM/G is among the fastest protocols with the exception of the newer versions of ZMODEM discussed below. If you have a modem that supports MNP or ARQ, YMODEM/G should be your usual choice on the BBS. Connections using two USRobotics HST modems, with ports locked at 19200 or 38400 at both ends, results in throughput in excess of 1725 characters per second! YMODEM/G also supports multiple file transfer (both down and up) of up to 99 files at on time.

1K-XMODEM/G - This version of 1K-XMODEM makes use of MNP hardware error correction to do away with the block-by-block checking in the normal version. The result is a very fast single file transfer protocol for use if YMODEM/G is not readily available.

ZMODEM - This is another protocol developed by Chuck Forsberg. It is a "streaming protocol", one which sends variable sized blocks of data with CRC-32 error checking for an accuracy of 99.9999%, but does not wait for an acknowledgment from the receiving computer. The sending system assumes data received is OK unless a repeat request is sent for a specific block. This streaming activity tends to make ZMODEM one of the fastest protocols available (but slightly slower than YMODEM/G or 1K-XMODEM/G). ZMODEM also supports multiple file transfer capability, and should be considered in situations where MNP is not available, or another batch transfer protocol cannot be used. ZMODEM also has the unique capability to resume file transfers that have been aborted for some reason and thus only partially completed. This is called crash recovery.

KERMIT - This protocol's main claim is not speed, but rather its ability to interact with many types of computers from mainframes to micros. It can cope with systems limited to seven-bit characters even when the data to be transmitted is in eight-bit form. All characters to be sent are translated into standard printable characters and reconstructed on the receiving end. While not terribly efficient, it is sometimes an absolute necessity for data transfer involving different types of systems and terminal types. It is not normally recommended for PC to PC transfers. Kermit

transfer speed can be dramatically increased by tuning its optional parameters

ASCII - ASCII transfer is simply the sending of information as characters, and is limited to 7 bit information. The transfer of files in ASCII mode can be done if your system is capable of any type of data capture. ASCII transfer is limited, and some sort of error checking protocol is required if you intend to transfer files with extensions of EXE, OBJ, COM, ARC or ZIP, as well as tokenized BASIC programs and files containing the IBM PC special ASCII characters (ones with ASCII values above 128). These files cannot be transferred in ASCII mode since ASCII transfer is only 7 bit and these types of files require the full 8 bit transfer of the data, with no translation of the contents of the file.

ClarisWorks: Objects Created With the Polygon and Bezigon Tools Not Printing in Color (DR)

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
This has been fixed in ClarisWorks Version 2.1v2 and above.

When printing to color printers, such as the Hewlett Packard DeskJet 1200C, objects created with the polygon or Bezigon tools may not print in color, but instead may print as black-filled objects.

This is a known bug with the LaserWriter 8.x driver. It is not specific to the HP DeskJet 1200c. The objects will print in color as well as black. The issue is that the fill color becomes the same as the pen color (which is usually black).

If you are unable to obtain the 2.1v2 update to ClarisWorks, a suggested workaround is to print using the Apple LaserWriter 7.2 driver. Or try applying the pen color that you actually want as the fill color. It won't look right on the screen, but it should print with the fill color you want.
Published Date: Feb 18, 2012

DOS 3.3: INTBASIC and FPBASIC on the master diskette

The INTBASIC and FPBASIC files on the master diskette load automatically into your Language Card if you have one. Since these files are written to operate specifically in the memory space of the Language Card, they don't work anywhere else.
This article has been archived and is no longer updated by Apple.
To use Applesoft with your Apple II (which has Integer BASIC built in), you need either the Applesoft Firmware Card or the Language Card installed into your system.

Apple II+s have Applesoft built in; therefore, your system needs the Integer BASIC firmware card or a language card to use Integer BASIC.

NEW EDUCATION SOFTWARE AVAILABLE FROM CLARIS AND CLARIS SOLUTIONS ALLIANCE MEMBERS

ClarisWorks solutions available for both administrative tasks and classroom use

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.

SANTA CLARA, Calif., -- April 18, 1994 -- Claris Corporation today announced that leading education publishers in the Claris Solutions Alliance (CSA), which includes third party software developers, consultants, trainers and publishers, have developed courseware and classroom resources designed for use with ClarisWorks, the award-winning integrated software solution available for Macintosh and Windows.

New education software solutions address a variety of curricula including language arts, foreign language, mathematics, science, social studies, and special education as well as classroom management and administration.

"At Claris, we're excited about education and exploring new ideas that will have long lasting value for schools and students," said Karen Billings, manager of education solutions for Claris Corporation. "By combining powerful, easy-to-use software from Claris with innovative education solutions, educators will be equipped to implement creative approaches to learning that utilize computers as powerful learning tools."

ClarisWorks tutorials for higher education programs

Mitchell McGraw-Hill has published two new ClarisWorks tutorials designed for education majors and certificate program participants. Using ClarisWorks for the Macintosh and ClarisWorks for Windows tutorials, students learn word processing, graphics, spreadsheets, charting and database applications. Each lesson contains objectives, a hands-on tutorial, a command summary and self-tests.

Templates ease curriculum building
and class management for K-12 educators

ClarisWorks in the Classroom is a set of templates designed to bring innovative computing and learning to elementary education. With these templates, children are able to learn the fundamentals of computing while also improving reading, writing and arithmetic. The lessons contain a teacher's manual which recommends the age group for the templates and how each lesson should be structured.

ClarisWorks for Teachers is a guide to help educators become more productive in managing everyday classroom tasks. ClarisWorks for Teachers includes templates for student information, grade recording, letters to parents, newsletters, room layouts, evaluation portfolios, progress reports, schedules and more.

Education solutions pricing and availability

Using ClarisWorks for the Macintosh and Using ClarisWorks for Windows are available directly from Mitchell McGraw-Hill for $16.50 each or through campus resellers. Contact Mitchell McGraw-Hill at (800) 338-3987. ClarisWorks in the Classroom and ClarisWorks for Teachers are available directly from Claris for an education suggested retail price of $29 each. Additional CSA-member developed education solutions are available directly from their publishers. For more information on Claris education solutions, call (800) 747-7483. Internationally, contact Claris at (408) 987-7000.

Claris Corporation, a leading worldwide vendor of Windows and Macintosh applications for business, education and home, is a subsidiary of Apple Computer, Inc. with headquarters in Santa Clara, Calif.

Shape Tools Objects print black from PageMaker

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
Pasting or Placing a Shape Tool object with a white fill from Impact into PageMaker shows fine on-screen but prints with a black fill.

Shape Tools include any shape from the last palette on the Tool Panel such as the five 5-point star.

Solution:
When in PageMaker, hold down the Option key while choosing Print from the File menu. This will override the Aldus printer drivers and use the Apple Printer drivers instead.

This is a problem with at least PageMaker 4.2. Aldus representatives have reported that PageMaker 5.0 has changed some of their print drivers, but it is unknown if this fixes the problem. PageMaker 3.0 users can change to an Apple Print Driver through the Print dialog box.

MacDraw Pro: Manual Feed Printing Results in Type 1 Error

This issue has been reported to Claris Tech Support, but has not been verified.

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
An error of type 1 occurs and the application, "Unknown" unexpectedly quits when the following criteria are met:

* Your document was created with MacDraw Pro 1.5v2 on a Power Macintosh 6100/60
* You try to print a document with the Manual Feed option selected on a Personal LaserWriter NT using the LaserWriter 8.1.1 driver (appropriate ppd selected)

The same document prints fine with Cassette Feed.

Suggested workaround: Use LaserWriter driver version 7.x.

Not Possible to Crop or Mask Images

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
MacDraw Pro does not have the ability to Crop or Mask images, whether drawn in MacDraw Pro or imported from another application.

Workaround:
Try using white boxes to cover the portions of the graphic that you want to Crop. This is not a good method if you are trying to Crop an image for use in another program. Consider another program for editing images such as BrushStrokes from the Claris Clear Choice division of Claris.

Master Slide Backgrounds do not Save to PICT or EPSF

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.

Issue:
Exporting a slide from the Presentation environment does not export some graphics or text.

Explanation:
Graphics or text created within the Master Slide will not export when trying to Save a slide to another graphic format such as PICT or EPSF. Anything added to the Master Slide is subject to not being exported. This could be a background from a Model Style or any type of graphic or text created while in the Master Slide.

Solution:
1. The best solution is to copy all the elements you added to the Master Slide and paste them onto every slide. If you have many slides then try solution 2.
2. Exporting your slides to MacDraw Pro or MacDraw II format will correctly save out any graphics added to the Master Slide. If you have MacDraw Pro or MacDraw II you could then open the file and save it to PICT. The best method, though, would be to open the file in MacDraw Pro so you could save to EPSF. In general, EPSF will capture the quality of the Slides better.

The ClarisImpact development team is aware of this issue. Presentation Backgrounds Save As Pict.

Add a Colored Border to a Cell in a ClarisImpact Table

What to do if you want your cell border to be something other than black.

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.
To add a colored border to a cell, follow the steps below:

1. Select a cell or cells in a Table.
2. Choose Cell Borders from the Table menu.
3. Select the type of border you desire and click OK.
4. Choose Grid Display from the Table menu.
5. Select the color you want next to Cell Borders and click OK.

NOTE: Using the color palette next to the Pen will not change the color of the cell border. Remember that adding a fill color to a cell is done by selecting the cell or cells and then choosing a fill color from the color palette next to the Fill tool (the paint bucket).

New Electronic Help Features

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
ClarisImpact and ClarisDraw introduce a new Help System with many advantages.

Searching results in a list of areas where the keyword was located rather than the old way of locating the first occurrence and showing that area of Help. Thus, searching should be much more efficient.

The interface has been improved. Color and graphics have been added. The Help window can be enlarged to any size.

Your own notes can now be added to the Help System to facilitate the learning process.

A Hot Key links Balloon Help and the Help System. Turn Balloon Help on, point at something so that a Help Balloon appears and then type the Help key from the keyboard (if you have an extended keyboard). Help will automatically be opened to the section related to that balloon.

It is possible to print any section of Help.

Words in blue text can be clicked on to pop-up more information regarding them. This can be very helpful when the definition of a word is covered in another section but you cannot remember the definition in this section.

In addition, the new online help system introduced with ClarisImpact and ClarisDraw contains many of the step-by-step instructions found in the User's Guide, which effectively guides you through a procedure. Pictures are included to make examples very easy to follow. The Troubleshooting section, which contains commonly asked questions, such as "How do I..." or "What happens when I...." will probably answer many of your questions. A Glossary of terms provides definitions to all the terminology that may be new to you.

Problem Opening ClarisWorks Paint Documents With Macintosh Easy Open (PT)

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.

There appears to be a problem with the extension Macintosh Easy Open, version 1.0.2, and ClarisWorks paint (PT) documents. Sometimes double-clicking on a ClarisWorks PT document does not allow ClarisWorks 2.0v1 to open it. Claris has been unable to reproduce the problem with ClarisWorks 2.1, but it may happen in that version also.

Current workarounds:

Launch ClarisWorks and use the Open Dialog Box (File Menu, Open...) to open the PT document.

Remove the Macintosh Easy Open Extension from the Extensions Folder and restart the Macintosh.

Published Date: Feb 18, 2012

Issues Custom Installing Fonts

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
Custom install gives you the option of installing your fonts in three different ways:

ClarisImpact Fonts for 7.1 or Greater
ClarisImpact Fonts for 7.0
ClarisImpact Fonts for 6.0.7

All three of these choices install the same fonts but in different ways. If you do not match the correct Font choice to your System Software version the following will happen:

1. If you have System 7.0 or 7.1 and accidentally choose to custom install "ClarisImpact Fonts for 6.0.7" then when you restart your computer you will get a message stating, "True Type is already installed... skipping installation!!!" Also, if you have System 7.1, your fonts will have been installed into the System suitcase rather than the fonts folder. To fix the first issue, remove the True Type extension from your Extensions Folder (it also may be at the System Folder level) and throw it into the Trash Can. System 6 needs the True Type extension but System 7 already has it built-in. To solve the second issue (for System 7.1 users only), simply double-click on your System and move the fonts into the Fonts folder.

2. If you have System 7.0 and accidentally choose to custom install "ClarisImpact Fonts for 7.1 or Greater" then your fonts will be installed in a folder called Fonts (it actually creates the folder called Fonts) in the System Folder. To fix this issue, simply drag the fonts from the System Folder into the System and then delete the folder called Fonts.

3. If you have System 7.1 and accidentally choose to custom install "ClarisImpact Fonts for 7.0" then your fonts will be installed in the System rather than the Fonts folder. Although it is okay to install your fonts into the System it is preferable under System 7 to install your fonts into the Fonts folder. To correct this issue, simply open the System and drag the fonts into the Fonts folder.

4. If you have System 6.0.7 or greater and accidentally choose to install "ClarisImpact Fonts for 7.0" then your fonts will still be installed properly into the System. While this is where the fonts should go it is possible that the True Type extension may not already be in your System Folder. The solution for this issue is to go back and custom install "ClarisImpact Fonts for 6.0.7".

5. If you have System 6.0.7 or greater and accidentally choose to install "ClarisImpact Fonts for 7.1" then your fonts will be installed into the System Folder and will not work properly. These fonts need to be removed from the System Folder and custom installed properly by using "ClarisImpact Fonts for 6.0.7".

For your convenience, below is a listing of all the fonts that ClarisImpact installs:

Bernhard Modern
Bodoni
Commercial
Futura
Impress
Kuenst
Zapf Humnst

Several versions of each of these fonts is shipped. For example, Bodoni ships with a regular and an italic version.

Apple IIGS/Macintosh Versus PC-LAN Baseband Network

I just finished a competitive bid against IBM in a local school district. We were using AppleShare and Farallon PhoneNET cabling with existing in-plant wiring; IBM was bidding PC-LAN Baseband and Novell.

What can you tell me about PC-LAN Baseband, especially regarding its competitive position against Apple products?

This article has been archived and is no longer updated by Apple.
IBM has two different networking schemes that are referred to as PC-LAN: Baseband and Broadband. They pitch Baseband for K-12 labs. Using the PC Network Adapter-II in the XT bus machines, like the original PC and PS/2-25/30, and the PC Network Adapter II/A for the MicroChannel machines, it is a 2Mbps CSMA/CD protocol run over unshielded, twisted-pair telephone wiring. The network uses the IEEE 802.2 LLC standard like AT&T StarLAN. A typical configuration is cabled in daisy-chain fashion using RJ-11 telephone jacks and telephone cabling with up to eight stations within a maximum 200-foot chain compared to a 4000-foot network limit with PhoneNET.

NetBIOS support is not provided directly on the card; it is via two software products, the PC Network Protocol Driver and the LAN Support Program. This network does not support 8022 LLC protocol or APPC/PC. This takes away from available, application memory. In addition, because Novell is the chosen server architecture, Windows is rumored to have difficulty--giving the Apple IIGS and Macintosh a further edge. As of March, 1990, IBM has not tried to demonstrate Windows on this configuration, lending support to this rumor.

The PC-LAN Baseband network can be enlarged using the IBM 5173 PC Network Baseband Extender, which has 10 ports. The network can be extended to 10 arms of eight workstations each, and the length of the daisy-chain arm is extended to 400 feet using the Extender. This means that the radius of a PC-LAN Baseband network cannot exceed 400 feet, giving a significant advantage to LocalTalk and PhoneNET networks. The maximum network is 80 stations, unless a router is used to bridge multiple networks together or to jump to another topology, such as Ethernet or Token Ring.

Apple's advantage against IBM as being Apple's Strategic Network Direction--AppleTalk over twisted-pair with higher-speed backbones versus a network direction on IBM's part that was not strategic (Novell and PC-LAN Baseband as opposed to Token Ring and LAN Manager). Both the Macintosh and Apple IIGS to give a Finder interface and graphic applications have the Finder interface, whereas IBM can show only Microsoft Works as evidence of their graphics interface. Further, Apple has a strategic graphics interface and contrasted the offering from IBM, which was not robust enough to run a Windows environment. Finally, the 8086 technology is not strategic for IBM and that Windows and OS/2 are really geared for the 80286 and above technology. This leaves schools wondering about the long-term viability of PS/2-25s.

Resizing the Rightmost Column in a ClarisImpact Model or ClarisWorks Frame

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
Resizing a column of a Table in ClarisImpact or a Spreadsheet frame in ClarisWorks is easy with the exception of the rightmost column.

Normally you would move the mouse pointer to the divider between the column header (ClarisWorks) or the divider between the columns of the first row (ClarisImpact) and wait for the mouse pointer to change to the shape (arrows pointing both directions) that indicates that you can adjust the column width by clicking and dragging. Unfortunately, there is no dividing line on the last column because there is no column to the right.

Follow the instructions below to resize the rightmost column:

ClarisImpact:
1. Click on any cell within the column that you wish to resize.
2. Choose Column Width from the Table menu and change the resulting dialog box.

ClarisWorks:
1. Click on any cell within the column that you wish to resize.
2. Choose Column Width from the Format menu and change the resulting dialog box.

The numbers in the Column Width dialog show the size in Points. There are 72 points in an inch. So, to make the column one-half inch wide, set the Column Width to be 36 points wide.

Spellcheck not Functioning on Thai System 7.1 (All)

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.

Scenario:
ClarisWorks 2.1 on Thai system 7.1 (TH1-7.1):
- using US keyboard
- using US ClarisWorks and US dictionary
- his system allows typing Thai characters

Issue:

- performing spell check on US text with NO Thai characters: spell check window appears with STRANGE characters (such as %$#) and Thai characters....when selecting "Skip", it crashes; when selecting "Cancel", exits.
- in menus, there are Thai characters, also in splash screen

more detail:

- this occurs regardless of font used
- also regardless of which system file originated from
- reinstalling dictionary/application does not help
- this does NOT happen on other US 7.1 systems

Why this occurs:

There is a bug in the Thai system's FindWord code, that the speller uses to find words. For the Thai version of ClarisWorks 1.0, completed just recently, the engineers had to write their own FindWord procedure to get around the bug.

The Thai characters that you are seeing in the menus and splash screen are high ascii characters that have a different representation in a Thai font than they do in a US (Roman) font. The font of a menu or dialog item in ClarisWorks running on a Thai system is not Chicago, but some Thai font that looks like Chicago. Similarly, items in the splash screen are not displayed in Geneva or Helvetica, but some Thai font. All high ascii characters, such as (É ª ¨) etc. will be displayed differently. Also, these high ascii characters can be part of a two-byte character and that's when things really look bad.

Solution:

Use a US system.
Most of our applications have to be reengineered to work on two-byte systems such as Thai, Japanese, Korean, Chinese etc. We don't certify any of our US or localized applications as compatible with such systems. ClarisWorks 2.0 TH will be released soon, so if the guy wants full functionality from a ClarisWorks application on a Thai system, he's going to have to get this version.

Using Outlines in Other Programs

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
The Outliner available in Claris Works and ClarisImpact does not copy the labels (bullets, numbers, etc.) when copying and pasting text. All that will be copied is the text in the Outline. You will notice if you choose Select All in the Outline that the labels will not highlight, indicating that they cannot be copied and pasted.

However, if you use a frame to create your outline, you can use Apple's Publish and Subscribe technology to Publish the frame itself and create an Edition file, or copy the frame and its contents to the Clipboard.

To create a frame that can be displayed in another application:
1. Launch Claris Works or ClarisImpact.
2. Create a text frame (In ClarisWorks) or an Outline model frame (In ClarisImpact).
3. Choose Outline View from the Outline menu (ClarisWorks, not necessary in ClarisImpact).
4. Enter the text of your outline and edit it normally.
5. Click on the graphics tool and select the frame.
6. Choose Copy or Create Publisher from the Edit menu.

If you have another application which supports Publish & Subscribe, like Microsoft Word, you can Subscribe to the Edition file if you wish to have the outline labels displayed. If you wish, you can also simply use the Paste command in order to place a PICT image of the outline into Word, or any other application which supports PICT images.

Using Quick Time Movies in ClarisImpact Flow Charts and Org Charts

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
QuickTime movies can be placed into the Positions in Organization Charts and Flow Charts. This can make your charts very effective when browsing on-screen.

For instance, you could insert a QuickTime movie of each employee into the Position representing that employee. Instead of a name, you could have a short self-descriptive movie.

You could also have a short QuickTime movie of a particular process and insert that into the Position which that process fills in a Flow Chart. Instead of simply having a picture of the process or the words "Assembly Line", you could have a short movie illustrating how the process is implemented or showing robots welding or parts being assembled.

Connector Cannot be Moved once it is Attached to Objects

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.

I created two objects and connected them with the Connector Tool but I cannot move the connector so that the objects connected move together. The computer just beeps at me.

A:
It is not possible to move a connector once it is attached to two objects. Connectors will remain in position between both connected objects, but cannot be used to move the objects around. If you move an object, the connector will extend itself to remain connected to the object in its new location.

Solution:
It would be better to group the two objects if you want them to move together. If you group both objects and drag them to another location, the connector will move with them.

Connector Lines Attach to First Object Drawn in Element Style

Behavior of Connectors Depends on Element Style

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.
It is important to remember that the Connectors in an Organization Chart or Flow Chart base their connection intelligence on the lowest object in the Element Style. In other words, Connector lines attach to the first object drawn or the object furthest back in the Element Style. This could cause a connector to appear to attach off-center. Try this example:

1. Create a new Organization Chart or Flow Chart Element Style.
2. Draw two rectangles in the Style Editor window, and make sure they are not touching.
3. Put in at least one field.
4. Apply this Element Style to an Organization Chart or Flow Chart element and notice that the connector attaches to the first object drawn.
5. Edit the Element Style and move the second object to the back and watch the connector now use this object as a guide for connecting.

Normally, objects will be superimposed on top of each other, so this is not a real-world example. It does illustrate the way that connectors and elements work together, and the logic behind connector behavior.

Demo Disk and XTND issues after Install Full Version

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
The demo disk for ClarisImpact installs the Claris XTND System and several translators into the ClarisImpact demo folder. This could cause issues if the customer eventually purchases the product since that copy of the Claris XTND System and the translators will still be on the computer.

Possible symptoms:

1. "XTND Not Found" message when try ing to translate.

2. The full translator list may not be available but everything seems to be installed correctly.

Solution:
The Read Me file that ships with the Demo disk mentions that all files that came with the demo disk must be removed from your hard drive before installing the full version. This should avoid most XTND issues.

ClarisImpact Demo Installs:
Claris XTND System version 1.3.6
Excel 3.0 translator version 1.0
Word 4-5 translator version 1.0v3.

Printing Multiple Envelopes In ClarisWorks (DR, DB)

An advanced technique for effectively printing multiple envelopes

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.
The easiest way to print multiple envelopes in ClarisWorks is to create a database to hold the name/address/mailing information, and a drawing document formatted for printing envelopes. If you use the Mail Merge feature to combine your names and addresses with the drawing document, you can easily and efficiently print your database on envelopes.

Follow this procedure:

1. Create a database with standard mailing fields (FirstName, LastName, Address, Address2, Company, City, State, Zip) or open your existing database file.
2. Create a Drawing (Graphics) document.
3. Choose Page Setup from the File Menu and choose an Envelope paper format. (If you do not have an Envelope format that you can choose, this technique will not work.)
4. Choose the landscape orientation.
5. Click Ok. When you get back to your document, you will see that the page looks like an envelope.
6. Click on the Text tool at the top of the toolbar, click in the top left corner of the page, and type your return address.
7. Click on the drawing tool (the pointer) at the top left corner of the toolbar, then click on the Text tool again.

8. Click in the center of the page and choose Mail Merge.
9. Choose your database file from the list.
10. Place your mail merge fields.
11. When you are finished placing the mail merge fields, resize the text frame in your drawing document so that the fields appear the way that you wish to print them. When you wish to print the database information on envelopes, choose Mail Merge again from the File menu and choose the Print Merge button.

Some significant advantages to this procedure are that ClarisWorks cleans up mail merges automatically, so you don't have to worry about extra space between your fields or misaligned information on the printed envelope.

Try a printout and see the results. Be sure to print on plain paper to check the placement of your text (hold an envelope over the printout to see where the text would appear on the envelope), and make any necessary adjustments in your document before printing onto real envelopes.

Slide Show Begins with Current Slide, Not with First Slide

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
If you click on the slide show icon in a Presentation document style bar, the slide show will begin at the current slide, rather than the first slide.

This is a very handy feature when you are creating the slide show. You can work on a slide and quickly see how it will look in the presentation.

Command-clicking on the slide show icon will make it begin at the current slide of the show.
Published Date: Feb 18, 2012

Graphic, Model or Frame is cut off by Margin

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.

Issue:

ClarisWorks and ClarisImpact allow you to display the margins on screen so as to get a better idea what your document will look like when it prints. This can cause problems with graphics, Frames or Models. What may happen is that the picture, Frame or Model may get cut off on the top, bottom, right or left side where the object meets the margin (the Word Processing section of ClarisWorks and the Report Environment of ClarisImpact always have margins turned on but other environments require you to turn this feature on).

Solution:

Unless the graphic, Frame or Model is too large to display on the page, moving it should allow you to display the portions that are cut off. Decreasing the margins may also create enough room to display the complete object.

Published Date: Feb 18, 2012

Margins cannot be Hidden in Report and Presentation Documents

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
Page View is grayed out from the View menu while in a ClarisWorks Word Processing document, and Hide Page Breaks is grayed out from the View menu while in a ClarisImpact Report or Presentation document.

This is because the margins in the ClarisWorks Word Processing environment or the ClarisImpact Report and Presentation environments cannot be hidden. This can create a problem on small monitors. A good solution is to reduce the size of the margins until you need to print.

The Drawing environment in ClarisImpact and ClarisWorks does have the ability to hide and show the margins.

Rotated Text Prints Jagged

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
Rotated text in ClarisImpact will print bitmapped (72 dpi) in the following situations:

1. When using the Clipboard to paste to another program or the Scrapbook.
2. When using Save As... to create a PICT file.
3. When printing to a QuickDraw printer.

NOTE: In cases 1 & 2, rotated text may also print inverted (black background and white text). If the rotated text prints inverted, try using the Black & White option in the Print dialog box instead of Color/Grayscale. If you need the Color/Grayscale option turned on, you should use one of the techniques listed below.

Most QuickDraw printers do not give you a Color/Grayscale - Black & White option, so if you have a QuickDraw printer, your rotated text will always print jagged.

High resolution is retained when you:

1. Use Save As... to create an EPSF file

If you need to use rotated text from ClarisImpact or ClarisDraw in another program, you should use Save As... to save the document as an EPSF file that you can insert into the other document. This avoids using the Macintosh Clipboard, which would convert the rotated text into a 72-dpi graphic image.

2. Use a Library to store the rotated text

If you are using the Scrapbook to store commonly used graphics or text frames that were created within ClarisImpact or ClarisDraw, consider using the Library feature instead.

3. Use the Clipboard within ClarisImpact or ClarisDraw documents

ClarisImpact and ClarisDraw use an application clipboard that correctly maintains the properties of rotated text. This avoids using the Macintosh Clipboard, which would convert the rotated text into a 72-dpi graphic image.

Gradients Printing with Large Bands to a LaserWriter

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.

PROBLEM

When I print gradients from MacDraw Pro, I get large bands instead of a smooth progression even though I am printing to a Postscript printer.

SOLUTION

You are probably using the LaserWriter 8.0 driver. Switching to the 8.1 or greater driver will solve the problem. Printing with a 7.x driver will also solve the problem.

Connector Lines not Printing with PowerPrint

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
A customer has reported that when using the GDT Software PowerPrint to print a Basic Flow Chart from a Macintosh to a Sharp JX 9500H (for IBM compatibles), the Connector Lines between Elements do not print when saving to PICT and importing to Word. The Connector Lines can be seen on screen and printed from within ClarisImpact.

Solution:
Updating to version 2.0v1 of PowerPrint solved the printing problem.
Published Date: Feb 18, 2012

Dates from FileMaker Place or Publish to Timeline incorrectly

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.

Problem:
When I Place or Publish a date field(s) from a FileMaker database to a ClarisImpact Timeline the dates are not correct or do not appear at all.

Explanation:
Dates from FileMaker do not Publish into a ClarisImpact Timeline correctly. The reason could be that the dates from FileMaker do not have a leading zero in single digit months or single digit days. Dates with double digit days will Place or Publish & Subscribe correctly.

Workaround:
Use the FileMaker Date Format feature to format the date field so that it has leading zeros. When exporting or publishing make sure to use the option "Format output using current layout".

The ClarisImpact Development is aware of the problem.

Replacing British English Dictionary With US English When Installing ClarisWorks Again (All)

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
When Installing a version of ClarisWorks over a previously installed version, the dictionary will normally be replaced automatically. However, if you are currently using the British English Dictionary and want to install from disks that contain the US English Dictionary, the dictionary will not be replaced by the installer.

To correct this problem, you can remove the Main Dictionary from the Macintosh (you may wish to make a backup copy of it in case you decide you'd like to use it later). The Main Dictionary is located inside the System Folder , within the folder named Claris.

Once the previous Main Dictionary has been removed, you may proceed with installing ClarisWorks from the installer disks Since the installer will not see the previous dictionary, it will install the new dictionary.

Smart Quotes not Printing

Here is a quick way to get Smart Quotes to print without turning off extensions.

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.
If Smart Quotes do not print there are three possible reasons: an extension conflict, that the font you are using is corrupt or that the font that you are using does not support the smart quote characters.

When you are troubleshooting this kind of issue, you can approach each of the possibilities separately:

If you are using Macintosh System 7, restart your Macintosh with the Shift key held down. This allows you to restart the machine and turn off all extensions. If the issue goes away, then you know that the issue is caused by an extension conflict. If you need to use Smart Quotes, you will need to troubleshoot the extension conflict. Call Claris Technical Support.

If you do not want to spend time determining which extension is causing the issue, try turning Smart Quotes off in Preferences. Any quotation marks that you type with Smart Quotes turned off will show up as straight quotes, not "curly" quotes. Also, while in Preferences (in ClarisWorks, ClarisImpact and ClarisDraw), click on the Make Default button so that all new documents use regular quotes. In all other programs, use a Stationery document to save regular quotes as a default.

If the issue does not go away when you restart your machine with Extensions off, it is likely that you have a corrupt font or a font that does not support Smart Quotes. Try switching to another standard Macintosh font like Times or Helvetica, to see if your Smart Quotes print properly.

If switching to another font allows the Smart Quotes to print, then you know that the original font is either damaged or does not support Smart Quotes. To check for damage, remove and reinstall the font and see if that fixes the issue. To see whether or not that font supports Smart Quotes, contact the font manufacturer.

Replacing Smart Quotes with regular quotes:

The above directions describe how to use straight quotes. If you want to change the Smart Quotes you currently have, you will need to use the Find/Replace feature.

You can type a Smart Quote into the Change section of Find/Replace by using these keyboard combinations:

Option-[creates opening Smart Quotes:
Shift-option-[creates closing Smart Quotes:
Option-] creates a single opening Smart Quote:

Shift-option-] creates a single closing Smart Quote:

To Replace the Smart Quotes:

1. Choose Find/Change from the Edit menu and select Find/Change from the pop-out menu.
2. Type the opening Smart Quote into the box marked "Find."
3. Type the straight quote into the box marked "Change."
4. Click Change All. You will get a warning saying that you cannot undo the Change All command. Click Ok.
5. You will see a dialog that tells you how many instances of the Smart Quote were changed into the straight quote. Click Ok.
6. Choose Find/Change again from the Edit menu and select Find/Change from the pop-out menu.
7. Type the closing Smart Quote into the box marked "Find."
8. Type the straight quote into the box marked "Change."
9. Click Change All. You will get a warning saying that you cannot undo the Change All command. Click Ok.
10. You will see a dialog that tells you how many instances of the Smart Quote were changed into the straight quote. Click Ok.

Timeline not Calculating Dates Correctly

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
This issue is fixed in version 1.0v3.

ClarisImpact 1.0v1 and 1.0v2 do not correctly calculate when using weeks with less than seven days. The most common example is the five-day week (excluding Saturday and Sunday). Try this example to see the issue:

1. Create a new Custom Timeline with a five-day week.
2. Change the Data Display... to show Duration and Planned Start.
3. Change the Duration of the first Task to be 1 day.
4. Change the Planned Start to February 18th, 1994 (Friday).

Notice that Task 2 calculates the Planned Start as Saturday even though you have told it to calculate based on a five-day week.

Workaround:
In the above example, change the Duration in Task 1 to be 1.01 days. The Planned Start in Task 2 will now calculate correctly. In general, add .01 to any duration where the dates are not being calculated correctly.

XTND Bridge Translators not Changed by Preferences

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
ClarisImpact allows you to modify the way that specific graphic translators operate. For example, you can set your EPSF Export translator so that the Macintosh color header information is not included, if you wish to take your EPSF files to a PC.

To modify those translator settings, choose Preferences in the Layout menu, choose the Translators preference icon, choose the translator that you wish to modify and click Set.

However, you cannot modify XTND translators that are accessed through the XTND Bridge. This Preference section only allows modification of XTND translators that ship with ClarisImpact.

DataViz is a common distributor of XTND translators that require the XTND Bridge to work with Claris applications. The telephone number for DataViz is 800-733-0030.

Cross-Platform File Compression Compatibility using ZIPIT for Intel-Based PCs and STUFFIT for Macintosh

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.

File compression and archiving is a way of storing a group of files and/or directories in one file, thus saving computer storage space and reducing the amount of time it takes to transmit them over phone lines or networks. Besides the backing up of important information, this can be helpful if files are too big to fit on a diskette or by reducing the amount of online/phone charges needed to upload or download a file from an electronic service or BBS.

The industry standards for file compression are StuffIt for the Macintosh and PKZIP for DOS based machines. Since both of these utilities have shareware versions, they are readily available through most online services In most cases, so they are easy to recognize, StuffIt files have a ".SIT" extension and PKZIP files have a ".ZIP" extension at the end of their filenames .

To use and access these files, they must be decompressed. Besides compatibility on their native platforms, there are utilities available that will allow you to open and decompress a StuffIt file on a DOS machine and a ZIP file on a Macintosh, thus making file transfer between the two platforms more seamless. Two such utilities are ZIPIT for the Macintosh and UNSTUFF for DOS machines.

ZIPIT for the Macintosh
This application has a similar interface to StuffIt and is just as easy to use. To decompress a DOS PKZIP file follow these steps:

1) Launch ZIPIT by double clicking on it's icon.
2) Pull down the FILE menu and select OPEN
3) Select the ZIP file that you wish to open by double clicking on it or by highlighting it and clicking on the OPEN button in the Open/Save dialog box. The Finder dialog will only show valid PKZIP files. If the file does not show up in the Finder dialog, it is either not a ZIP file, a corrupted ZIP file, or a self-extracting ZIP file.
4) Select the file(s) from the list that you wish to extract. If the ZIP file contains multiple files and/or directories you can select them all by doing a command (Apple) A (Select All.) To extract files, pull down the ZIP menu and select EXTRACT or use command (Apple)-E
5) Another dialog box will appear asking you where you want the files extracted. Navigate the finder until you locate the desired folder. If you wish to rename selected files or changed the target folder before the files are decompressed, change the name and/or folder name of each one, using the SAVE button to go onto the next file. If renaming of files is not desired, or to speed up the decompressing process, the SAVE ALL button can be used. This will not prompt for files to be renamed and will use the name contained in the original ZIP file and copy them to the selected folder.

Note: Make sure the filename ends with .FM for FileMaker files and .CWK or .CWS for ClarisWorks files before opening them. It is necessary to open a file through the File menu of FileMaker or ClarisWorks the first time instead of double clicking it when the file comes from a PC. Afterwards, you will be able to open the file by double-clicking it from now on.

UNSTUFF for DOS
This program has a similar interface to PKZIP and is command line based. For help on using UNSTUFF and for an explanation of it's command line parameters, type UNSTUFF by itself at the DOS prompt. To open a Macintosh Stuffit file on PC follow these directions.

SYNTAX: UNSTUFF [options] [archive name[.sit]]

1) For example to "unstuff" a StuffIt file called TEST.SIT, you would type at the DOS prompt. UNSTUFF TEST.SIT This will created a subdirectory called TEST in your current directory and copy all the files contained in TEST.SIT into it. If you wish to UNSTUFF the files in the current directory without a directory being created, you would type at the DOS prompt. UNSTUFF TEST.SIT -d. Macintosh filenames allow spaces and up to 32 characters. If files that are contained in TEST.SIT do not conform to the DOS naming convention (8 characters with a 3 character extension), UNSTUFF will strip out all the spaces and truncate the filename automatically.

Example:
"This Is A Test.FM" will become: "THISISATE.ST "
"This Is Another Test.FM" will become: "THISISANO.THE"

When unstuffing FileMaker Pro files, it is a good idea to rename the file so it has an ".FM" extension so it will be easier to locate and be associated in Windows with the FileMaker application. In the above example, to rename "THISISANO.THE" to "CLARIS.FM" type the following at the DOS prompt. REN^THISISANO.THE^CLARIS.FM (^=space)

Compatibility Note: ZIPIT is compatible with files created with PKZIP 2.x. The shareware version cannot extract files that are encrypted with a password. UNSTUFF is compatible with files created with Stuffit 1.5.1 through Stuffit Deluxe 3.0.3 but will not open a file that has been encrypted or optimized. ZIPIT for Mac can expand self-extracting .EXE files but UNSTUFF for DOS cannot expand self-extracting archives created by Stuffit for Macintosh.

Versions Tested: UNSTUFF Version 1.1 + ZIPIT Version 1.2 Availability: Both utilities are available on the Claris BBS.

Claris Dictionaries do not Detect Contextual Misspellings

Claris spell checking dictionaries cannot check for context when checking for misspellings.

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.

The spell checker shipped with the Claris product dictionaries (most recent version is 2.3) differs with proof readers and grammar checkers in that it cannot decipher the context in which the spelling error has occurred. In other words, the spell checker does not detect words with different spellings when each spelling is correct in a particular context.

Examples:

1) Past Participles vs. Present Tense
Forms of the same verb (e.g. "porte" vs "porte"), or words such as "cote" and "cote" or past participles and nouns (e.g. "carre" and "carre") are an example. These words are accepted by the spell checker in either form of spelling (with or without accents) because both forms are acceptable.

2) Words beginning with "l" apostrophe (such as "lhumanite"), when typed erroneously with no accent, are detected as spelling errors, however a suggested replacement is not displayed.
3) Words that are not in common usage but do exist.
Potage isn't in most dictionaries and isn't in the Claris Thesaurus. The definition of Potage is "Thick Soup". It's a French term and was found in the Oxford American Dictionary, in paperback form. The spell checker will not tag this word if it is a misspelling for postage.

Information on "Fractional Character Widths" and "City-named" Fonts

When to use "Fractional Character Widths" - Using "city-named" fonts and their high resolution partners.

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.
Geneva, along with other "city-named" fonts (New York, Monaco, Athens, San Francisco, etc.) are low-resolution fonts. They are optimized to look best when printed and/or viewed at 72 dots per inch (i.e., on a screen, or when printed to a low-resolution printer like an ImageWriter).

Non city-named fonts are usually high-resolution fonts, which don't look as good on screen, but they look good when printed to a high-resolution printer, such as a laser printer or an inkjet printer. There are "pairs" of low- and high-resolution fonts: New York is the low-resolution version of Times; Geneva is the low-resolution version of Helvetica; and Monaco is the low-resolution version of Courier. "Fractional Character Widths" is a setting which should be used when printing high-resolution fonts to a high-resolution printer. If this setting is off, then the Macintosh will assume that you are printing to a low-resolution printer, and it will space characters more broadly. This is fine for low-resolution fonts, like Geneva, as it spaces them out more appropriately, especially for on screen viewing or when printing to a low-resolution printer. But leaving Fractional Character Widths off will cause high-resolution fonts to have gaps if printed to a high-resolution printer.

Turning Fractional Character Widths on tells the Macintosh to space characters more finely when printed. This makes low-resolution fonts look bad, because they're not designed to be spaced this closely, but it vastly improves the look of high-resolution fonts when printed to a high-resolution printer.

Generally, if you're designing something to be displayed on screen, or for a low-resolution printer, it's best to choose low-resolution, or "city-named" fonts, and leave Fractional Character Widths off. But if you're printing to a laser or inkjet printer, and an occasional compressed character on screen doesn't bother you, then you should use high-resolution fonts and have Fractional Character Widths on. That's the setting most people should and do use. Note that none of this has anything to do with whether or not the font you're using is a TrueType or a bitmap font. TrueType fonts scale to any size very nicely. Geneva, New York or Monaco are not going to be spaced (kerned) as well as a high-resolution font when printed to a high-resolution printer.

MacDraw Pro: Text Object has Extra Space

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.

ISSUE:
The text object on the screen has extra space between the right edge of the last character and the boundary of the text object frame.

EXPLANATION
You have probably created a text object that is Center or Right aligned and then substituted a larger font. MacDraw may not accurately recalculate the text object boundaries in this situation.

SOLUTION
Select the text object and reselect the alignment that has a check mark next to it in the Style menu. This will resize the text object's boundaries and eliminate the space.

TO REPRODUCE
* Create a new MacDraw Pro Document.
* Choose Center from the Style menu.
* Click in the document and type a few words of text.
* Hit the enter key to activate the selection handles of the text object.
* Change the size of the text object to a larger size (18 or 24). Notice that there is space between the last character and the selection handles.
* To fix the problem, reselect Center from the Style menu. Notice that the selection handles on the right move to indicate that the text object has been resized.

Pie Charts With Only Two Segments or Sections May Print Incorrectly to Color QuickDraw Printers (SS)

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.

Issue:

The segments of a pie chart may split and print incorrectly to a color QuickDraw printer (such as the Apple Color Printer or the HP DeskWriter 550C). Specifically, a small arc segment of the bottom pie segment is separated from the rest of its segment and prints offset from where it should be.

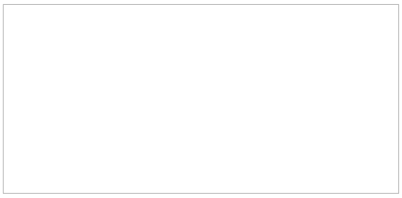
The issue seems to occur only when ALL of the following conditions are :

* The data being charted includes only two items with data (in other words, the pie chart has only two segments or sections)

* Explode slice is selected in the Series Chart Options

* The chart has been enlarged to fill the entire page (presumably in Landscape mode in Page Setup..).

ClarisWorks Development is aware of the issue. There is no known workaround at this time (other than making the chart smaller than the page or not exploding the slice).



Sample of data which will produce the error when charted as a pie chart.

Behavior of Connectors With Grouped Objects

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
Connectors were not designed to be used with Grouped objects.

If you Group several objects and then try to attach a Connector (Right-angle or Straight Connector) you will have difficulty finding a good attachment point with the PointGuide. If you do find a location where the Arrow tool shows a plus sign ("+"), the Connector may not be attached to any particular object in the Group.

The best solution is to Ungroup the objects and attach the Connector to just one of the objects. Also, Grouping objects that have Connectors attached will detach the Connector.

Explanation:
The connector is connecting to the center or corners of the group. It treats the group of objects as if it were a single object.

Here's an easy way to see it.
1. Draw a diagonal line.
2. Duplicate the line, rotate it 90¡ and align the center points of the two lines so that they look like the letter "X."
3. Group the lines.
4. Now try attaching a Connector.

Numbering Pages When Printing a ClarisWorks Database (DB)

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
Printing page numbers when printing from a ClarisWorks database is done in a different manner than it would be in FileMaker Pro. (See below **)

Getting page numbers to automatically print on a ClarisWorks database can be accomplished as follows:

1. Choose Layout menu and make sure that Browse is checked.
2. Choose Format menu and select Insert Footer, assuming you want the page numbers at the bottom of each page. If you prefer that the page numbers appear at the top of the page, choose Insert Header instead of Insert Footer.
3. From the Edit menu choose Insert Page #.

You can format the page number any way you wish (center, etc.), including adding the word ÒPageÓ before it.

Notes:
1) The page number will print, but will not show up on screen unless you turn on Page View in the View menu.

2) The Format Menu, Insert Header or Footer command is not layout specific. In other words, using this method will resulting in page numbers printing for the entire file, on every layout.

**FileMaker Pro allows you to place a page number symbol within the Layout Footer (or Header) part. This allows you to have page numbers print only when printing from specific layouts.

Cannot Change Master Slide Line Spacing

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
Because you cannot place your cursor in the Body or Title of the Master Slide, it is not possible to directly change the line spacing of the Body or Title in the Master Slide of a Presentation document.

If you wish to change the Master Slide line spacing, you have two options: you can choose the line spacing for the Title or Body on one of the other slides, then copy and paste it into the Master Slide, or you can manually change the Title or Body text on each slide.

To copy and paste from another slide:

1. Go to the slide which has the text formatting that you wish to appear on the Master Slide.
2. Select the Title or Body on that slide and use the Copy command to copy it to the Clipboard.
3. Switch to the Master Slide using the Slide Selector at the bottom of the screen or by choosing Edit Master Slide... from the View Menu.
4. Delete the Title or Body from the Master Slide and use the Paste command to paste in the new Master Slide Title or Body.

To change the line spacing on a single slide:

1. Select all the lines in the Title or Body that you wish to change.

2. Choose Paragraph... from the Text menu. The resulting dialog box will allow you to change the default 1.5 line spacing of the Body or the 1 line spacing of the Title.

Note that this second option overrides the Master slide formatting.

Published Date: Feb 18, 2012

Dragging Columns Does Not Insert

Instead of inserting the dragged column in the new location, ClarisImpact swaps the newly-placed column with the column in the location where it is to be placed.

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.
In ClarisImpact tables, you can drag on the column headers to quickly move a column to a new location. However, the column in that new location will be swapped with the column that you are dragging.

For example, if you have five columns in your table and you decide to drag column five to place it after the second column, you might expect to get a column order of 1, 2, 5, 3, 4. In fact, dragging column five to place it after the second column results in an order of 1, 2, 5, 4, 3. Columns 3 & 4 do not move over to allow column 5 to fit; columns 3 and 5 have been swapped. This also happens with a Timeline or a table attached to a Data Chart.

However, using Copy and Paste will allow you to get the results you desire. Following are the exact steps to insert rather than swap:
1. Select the entire row or column that you wish to insert elsewhere.
2. Choose Cut from the Edit menu.
3. Select the Row or Column after the one you wish to insert into (for example, to insert between columns 2 & 3 select column 3).
4. Choose Insert Cells from the Table menu.

5. Choose Paste from the Edit menu.

Quick Steps on How to drag a Column or Row:
1. Select the Table so that the gray border is showing around the edges.
2. Position your Mouse pointer next to the top edge of a Column or left edge of a Row until it turns into a down pointing or right pointing arrow.
3. Drag your pointer to where you want the Column or Row to go. You will get a visual indicator next to the mouse pointer when you are performing this action correctly.

Swapping Columns is also covered on page 6-10 of the ClarisImpact User's Guide.

How to Edit a Chart Model as a Picture

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.

Sometimes you may want to edit charts created in ClarisImpact so that they show conceptual rather than numerical relationships between numbers. Editing Chart models as pictures in ClarisImpact requires a few extra steps, because of the link between charts and their table data. To edit a chart model as a picture, use the following steps:

1. Select the chart model.
2. Choose Separate Table from the Chart menu. (You will get a dialog box that says, "Separating the table from the Chart will make the chart values only modifiable from the table. Continue?" Click OK.)
3. Reselect the chart only.
4. Cut (or Copy) the chart.
5. Paste back into current ClarisImpact document (or other, new document).
6. Reselect chart graphic (which is now a grouped picture).
7. Go to the Arrange menu and choose Ungroup Picture. You will now be able to edit any part of the chart as a graphic object.

Note: Once you have performed this procedure, you cannot reverse it so that the chart graphic is manipulated as a chart model.

About Version 1.5v3, Fixes Power Macintosh Crash

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
MacDraw Pro 1.5 v3 is identical to MacDraw Pro 1.5 v2 with the following exceptions:

- A bug has been fixed in which placing objects from libraries crashed under System 7.1.2 (the Power Macintosh operating system);

- A bug has been fixed in which "Easy Install" was unavailable under System 7.1.2. If you clicked on "Easy Install," nothing would happen. (The workaround was to go to "Custom," then select Full Install from there.)

- The "Read Me" file has been updated to include a description of changes in version 1.5.3.

There have been no other changes.

Obtaining Version Information Of A Windows Display Driver

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
Display driver software is updated just like a commercial software package such as FileMaker Pro or Microsoft Word. You can find the file name of your video driver by viewing the System.INI file, located in the Windows Directory. Scan the [Boot] section for the line, "System.DRV = <driver.drv>". The file name of your video driver will be to the right of the "=" sign.

You can then use the Windows File Manager to locate that file in your Windows\\System directory. To obtain the date of the driver, click on the file one time, then choose Properties from the File menu. In addition to the date of the file, your video driver vendor may also include the version information.

Switching Between the LaserWriter 8.1.1 Driver and Fax/modem Software may Shift Drawing

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.

When reselecting the LaserWriter 8.1.1 driver in the Chooser after using fax/modem software, an open Claris CAD document may shift up and left. It seems that Claris CAD is retaining the page size from the fax/modem driver and is not allowing the margins to be reset while the program is running.

The solution is to Quit from Claris CAD, reselect the LaserWriter driver and reopen Claris CAD.

Reinstalling ClarisImpact Deletes Custom Model Styles

If you ever need to re-install your ClarisImpact element or model styles, be sure to save your custom styles first.

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.
The Installer deletes any custom Element or Model Styles automatically whenever you reinstall ClarisImpact. Art added to an existing Library or new Libraries is preserved.

Here are some suggestions to work around this:

* If you do not need to reinstall Model or Element Styles, select Custom Install. Because the Custom Install places all of the files into a folder called ClarisImpact Folder in your main Hard Drive window, the custom styles will not be deleted. Click Customize in the main installation window and specify what you wish to install.

* If you need to reinstall Model Styles, just remove the Models that have custom versions from the ClarisImpact Styles folder before you install and replace them after the installation is complete.

* If one of the Model Styles has a custom Style in it (that is, if your custom Style is not the one you wish to replace), store the Model in a Library to preserve it. To do this, you will need to create a Model with your custom Style, then add it to a Library.

Advanced Workaround Technique.

If you just want to reinstall one Model Style, copy the compressed Model Styles from Disk 1 onto your hard drive and use Stuffit to decompress the file.

ClarisDraw & Impact: Reshape Command Not Working With All Objects

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
Most shapes in ClarisDraw and ClarisImpact can be Reshaped simply by selecting the object and choosing Reshape from the Arrange menu. Some objects cannot be reshaped or reshaped with just one menu command.

Objects created with the following tools cannot be directly reshaped:

- Line Tool
The Line Tool cannot be reshaped even though the Reshape command is available when a line is selected.

- Arc Tool
The Arc Tool can be reshaped in two ways. If you select the Arc and then choose Reshape, you will be able to grab the beginning or end point and increase or decrease the amount of degrees in the arc. If you select the Arc and use the Convert to Bezigon menu command (Convert to Bezigon is only available in ClarisDraw) you will be able to reshape the the Arc by adding new points.

- Rectangle Tool
- Round Rectangle Tool
- Oval Tool
These shapes can only be reshaped in ClarisDraw, and can only be reshaped by using the Convert to Bezigon menu command and then choosing Reshape from the Arrange menu.

Transferring Elements/Symbols Between Computers

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
If you have made changes to some of your styles, and you wish to use those styles on more than one computer, you should copy your style files to the other computer so they can be used there.

Model elements and symbols are stored in folders inside the ClarisImpact folder called ClarisImpact Color Styles and/or ClarisImpact B&W Styles. These folders contain the style files for each type of model.

Note: In the following scenarios, the word 'symbols' refers to both Symbols and Elements.

Scenario 1: You have created/altered some symbols and you want to install them on a computer where the default symbols have not been changed or added to.

Solution: Copy either the appropriate symbol file (such as Timeline styles) from the style folder on your machine to the style folder on the other machine, replacing the style file. If you want to update the entire folder, you can copy the entire folder.

Scenario 2: You want to have two different sets of styles (the ones that Mary made and the ones that Mark made) on one machine.

Solution: Keep the symbols in different folders with different names. When you want to use a different folder, go to Preferences, under the Layout menu. Click on the Models icon. Now change the name in the ClarisImpact style folder box to the name of the folder you wish to use. Note: it is important that you have the style folder in the same folder as the application itself.

Scenario 3: You wish to add symbols that you have created to the symbol set on another computer. Perhaps someone else has edited their symbols, but wish to add some of yours to their symbols.

Solution: Make a model on a document that uses all of the symbols that you wish to copy. Open that document on the other computer. You can add symbols or elements by hitting the Add button on the symbols floater for each model.You may have to click the down triangle on the floater to see the Add button.

Accessing the Internet with ClarisWorks (CM)

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.

There are basically three ways of connecting to the Internet:
1. A direct connection. Many corporations and universities have a dedicated line which connects them to the Internet and enables you to access the Internet via their LAN (local area network) or WAN (wide area network). Ask your IS administrator if you have this kind of access.
2. SLIP (Serial Line Internet Protocol) or PPP (Point to Point Protocol) dial-up connection to an Internet Service Provider like Netcom (800-488-2558) or Northwest Nexus (800) 539-3505. This sets up a TCP/IP connection between you and the service provider and enables you to use dedicated Internet applications like TurboGopher, WinGopher and Mosaic just as you can with Method 1.
3. Terminal access to a UNIX server connected to the Internet, via a dial-up connection to an Internet service provider such as the two listed above.

You can use ClarisWorks to access the Internet with any of the 3 types of connections above.

Methods 1 and 2
Methods 1 and 2 require additional software, namely Apple's MacTCP control panel and a TCP/IP connection tool.

TGE TCP is a freeware connection tool by Tim Endres, available in the communications software libraries of major online services.

TCPack is a connection tool that allows simultaneous TCP/IP connections using Apple's MacTCP driver and the standard access interfaces of the Communications Toolbox (CTB). TCPack supports FTP server functions, running as a background task, TELNET protocol and negotiation parameters and the Domain Name Resolver (DNR) functions. TCPack FTP implementation supports: DARPA standard TELNET protocol; directory management functions (create, delete); file/directory list functions in user or application-oriented formats; send/receive file transfers (binary, ASCII or MacBinary); and simultaneous background FTP servers.

$85 retail
Sysnet Corp.
5301 Wisconsin Ave. NW, Ste. 640
Washington, DC 20015
202-686-5515
800-683-5515
202-686-6992 (fax)

Note: Claris has not tested TGE TCP or TCPack with ClarisWorks.

To use either tool, create a new ClarisWorks Communications document, choose Connection from the Settings menu and select the TCP connection tool. Then pick the Internet server you want to access from the list. If none appear, contact your IS administrator or Internet service provider to troubleshoot your Internet connection. The Internet Starter Kit, a book by Adam Engst, is an excellent resource.

You can keep a list of several host addresses in the Phone book in ClarisWorks by changing the Type field from "PhoneNumber" to "RemoteAddress" for TCPack and setting the Number field to the Internet address. The PhoneBook Type for TGE TCP is "HostName".

For example:

Name: "Apple"
Number: "apple.com" or "130.43.2.2"
Type: "HostName"

This allows you to have a single communications document that contains addresses of all the Internet sites that you might want to connect to, with a one-step connection process via the Phone Book popup menu.

Method 3
In this case, you use ClarisWorks Communications to dial into an Internet service provider, just as you would with a BBS, but once connected, you can issue UNIX commands to access Internet servers. Many universities and colleges provide dial-in, command-line access to students and faculty for free or at a low cost.

Example Session

Once you connect to an Internet server, regardless of whether you are using Method 1,2 or 3, you will be prompted for an account name and password. After logging in, you can issue Internet commands such as mail, telnet, ftp, archie, wais, and gopher to access Internet services. ClarisWorks acts as simple terminal emulator, enabling you to type commands and see information that the host sends.

TA42898_Accessing_the_Internet_with_ClarisWorks_CM.pdf

Here is an example of what an Internet session is like using ClarisWorks:

- Dial up the Internet host as you would any BBS, using the settings the host requires.
- Once connected, type your user ID and password when prompted.
- You'll be presented with a menu of choices or in some cases just a prompt.
- Type "mail" to see if you have any mail. Once you're finished there, type "quit" to get back to the main prompt.
- Type "ftp ftp.claris.com" at the prompt. This will connect you to the Claris ftp server. Type "ls" to list the file directory. There is a "pub" directory, and you could see what is in it by typing "cd pub" to change to that directory and then "ls" to list what's in it. One of the items you'll see is "updaters" and you'll find Claris updaters in that directory.
- To download a file, type "get", a space, and the name of the file. This will download the file to the Internet host you are connected to which should happen pretty quickly. Then you need to download the file from the host to your hard drive. This takes a longer time since the file is being sent over the phone line via modem. You do this with the command "send filename protocol" where you substitute the name of the file for "filename" and the download protocol you want to use for "protocol". ClarisWorks defaults to the xmodem protocol.

The Whole Internet User's Guide & Catalog, by Ed Krol, gives specific examples of working on the Internet via command-line access and is an excellent book.

CLARIS INTRODUCES CLARISWORKS HOME PACK

39 templates designed specifically for home computer users to manage everyday tasks using ClarisWorks

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.

SANTA CLARA, Calif. -- May 23, 1994 -- Claris Corporation today announced immediate availability of the ClarisWorks Home Pack, a collection of templates designed to help home users streamline everyday tasks using ClarisWorks and their home PCs.

The ClarisWorks Home Pack features easy to use templates for anything from balancing the family checkbook and managing a budget to planning family activities and keeping track of friends and relatives. It lets both new and experienced personal computer users benefit from the capabilities of ClarisWorks integrated or "works" software.

"ClarisWorks use is very strong among users in home, small business and education markets," said Mike Davison, director of Solutions Marketing for Claris Corporation. "With the ClarisWorks Home Pack, we are providing home computer users with an extensive collection of templates designed to optimize their use of ClarisWorks ?another example of the Claris commitment to providing truly usable software solutions."

Manage a garage sale or track investments

The ClarisWorks Home Pack includes a variety of templates for creating fliers, announcements, bulletins, certificates and awards, invitations, personal stationary, newsletters, notices and resumes. Users simply replace template text with their own information to create great-looking results.

The Home Pack also contains home finance management tools to help balance a checkbook, manage a budget, track investments and calculate loan payments. It even contains a worksheet that helps users determine how much they can afford to spend when purchasing a home.

The ClarisWorks Home Pack features an electronic address book for home PC users to organize contact information about relatives, friends, neighbors, club members and business associates. A mail merge template can automatically insert these names and addresses to create custom form letters. Home organization templates give users the ability to create calendars of family events and maintain a list of all household belongings including their value-a real asset for insurance claims.

ClarisWorks is a best-seller

ClarisWorks, the award-winning software available for Windows and Macintosh, seamlessly integrates word processing, spreadsheet, charting, database, graphics and communications environments. With record sales that topped 1.7 million units by the end of 1993, ClarisWorks is the best-seller and installed-base leader among Macintosh integrated applications.

Both ClarisWorks for Windows and ClarisWorks for Macintosh have received outstanding press reviews and won several awards. Home Office Computing awarded ClarisWorks the EditorsÕ Pick for 1993 in the Integrated Software/Windows and Macintosh categories.

Pricing and availability

ClarisWorks Home Pack is available directly from Claris for $29. The Home Pack is available for use with ClarisWorks 2.0 and higher on Macintosh systems and ClarisWorks 1.0 on Windows systems. For general information about Claris products and non-technical questions, users should call Claris customer relations at (408) 727-8227.

Claris Corporation, a leading worldwide vendor of Windows and Macintosh applications for business, education and home, is a subsidiary of Apple Computer, Inc., with headquarters in Santa Clara, Calif.

ClarisWorks 2.1 Installer Doesn‘t Always Request Disk 3 (All)

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.

Question:
When I run the installer for ClarisWorks 2.1v3, it doesn't ever ask me for Disk 3. Is there a problem?

Answer:
Disks for ClarisWorks 2.1v3 include both versions of ClarisWorks (the one for a regular Macintosh and the "native" one, which is optimized for the Power Macintosh). The Installer automatically checks which type of a Macintosh it is installing onto and intelligently chooses which version of the program to install.

When installing on a regular Macintosh, all of the files required for installation are contained on Disk 1 and Disk 2. Consequently, an installation onto a non-Power Macintosh will NOT prompt you to insert Disk 3 during the install process. This is perfectly normal. The only files on Disk 3 are those used when installing on a Power Macintosh.

Flip Command Makes Arrows Work Improperly

This problem is relatively uncommon.

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.
If you use Flip Horizontal or Flip Vertical with a vertical line which has an arrow point, the arrow point will not always work properly.

To see this happen, try these steps:

1) Create a line with an arrow at the start. Hold down the Shift key while you are dragging the line so that the line runs vertically. When creating the line, drag from bottom to top.
2) Use either the Flip Vertical or Flip Horizontal command from the Arrange Menu to flip the line. If you used Flip Vertical, then the arrow will now point straight up. If you used Flip Horizontal, then the arrow will remain pointing straight down.
3) Select the line and drag the bottom selection handle to make it shorter (dragging up).
4) The arrow head will move to the other end of the line.

Note: you can avoid this problem if you use the Rotate 90 degrees or Free Rotate commands.

This problem is fixed in ClarisImpact 1.0v3, but not in the latest version of ClarisWorks (2.1v4). To obtain the latest version of ClarisImpact or ClarisWorks, contact Claris Customer Assistance at (408) 727-8227.

Flip Horizontal and Flip Vertical Make Text Uneditable

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
Text which is transformed with the Flip Horizontal and Flip Vertical commands becomes uneditable. ClarisImpact changes the text into a picture.

However, when you use the Rotate 90 degrees or the Free Rotate commands, the text remains editable. Note: if you use the Free Rotate feature, hold down the Shift key while dragging to constrain the rotation to 45 degree increments (unless you have changed the Preference setting for Shift Constrain).

How to Unsort a ClarisWorks Database (DB)

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
Once sorted a ClarisWorks database will remain sorted. Adding new records will cause the status panel to change to "unsorted", but records entered prior to the sort will still be in sorted order.

However, you can easily unsort a ClarisWorks database and place it in a random order.

Follow this procedure:

1. Choose Define Fields from the Layout menu.
2. Define a new text field called "Unsort".
3. Click Done. (Do not type anything into the Unsort field at this time)
4. In the Browse mode, choose Sort Records from the Organize menu.
5. Sort based on the Unsort field.

Please note: The above method will randomize the order of the records. Unlike the "Unsort" feature of FileMaker Pro, this method will not return the database to the order of entry of the records.

ClarisWorks: Pasting Text From Compton‘s Interactive Encyclopedia

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
ClarisWorks and FileMaker Pro may encounter issues when pasting text that has been copied from Compton's Interactive Encyclopedia version 2.02VW.

When pasting into a ClarisWorks WP document, the Edit menu will appear selected and it will seem as though the text is just taking a long time to paste. Only a "force quit" will get you out of this state (Command-Option-Esc).

When pasting into a text field or layout in FileMaker Pro, an alert will appear that states, "Sorry, this operation could not be completed because you have exceeded the text block limits."

Workaround #1
If you have a copy of either TeachText or SimpleText, free text utilities from Apple Computer, Inc., paste the text into a new TeachText or SimpleText document and save. To open this new file from within ClarisWorks:

1. Choose Open from the File menu.

2. From the Document Type pop-up, choose Word Processing.

3. Select your Teachtext or SimpleText document and click Open. (The translator is able to "filter" the offending data)

There has been some success pasting the CIE text into MacWrite II or MacWrite Pro as well, it depends on whether the text that was copied from CIE contains specific hidden control characters.

Work around #2
If you don't have access to TeachText or SimpleText and ClarisWorks is your only word processor application, you can strip these hidden characters by pasting the text into a ClarisWorks Communications document.

To set up a ClarisWorks Communications document for this purpose:

1. Open a new Communications document.

2. From the Settings menu, choose Connection.

3. Select Serial Tool from the Method pop-up and click OK.

4. From the Settings menu, choose Terminal.

5. Choose TTY Tool from the Emulation pop-up. Also select these other options: Width, 132 columns; Size, 9 point; Characters, Show control characters; New line on a return; Click OK.

7. From the Session menu, choose Open connection.

8. From the Edit menu, choose Paste.

9. From the File menu, choose Save. Save this as a Text file.

This new text file can then be inserted into another document or opened through the Open dialog box. The drawback of this technique is that there will be some extraneous carriage returns due to the line feeds (one every 132 characters). These can be eliminated with the ClarisWorks Find/Change option.

Resizing Rows and Columns Uses Small Activation Area

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
ClarisImpact allows you to resize columns and rows by placing the cursor on a column divider in the first row of cells or a row divider in the first column of cells. When the cursor gets to this position it will change from a plus sign to an up-down arrow (for changing row height) or a left-right arrow (for changing column width) to indicate that you can now change the row or column size.

However, only the topmost portion of the first column divider and the leftmost portion of the first row divider make the cursor change from a plus sign into an up-down arrow or left-right arrow (See page 6-19 for a screen shot of the left-right arrow). The activation area is approximately 1/4" from the edge of the table frame.

The same is true for Timeline and Data Chart Models.

You can also click in a cell and choose Column Width... or Row Height... from the Table Menu to specify the row height or column width for that cell and its row or column. For example, to change the width of the first column, click in any cell in the first column and choose Column Width from the Table Menu.

Text To Speech Only Uses Female Voice (All)

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
This is fixed in ClarisWorks 3.0.

There is an undocumented feature in ClarisWorks 2.1 that allows an AV Macintosh to read the text typed on the screen. This capability is accessed through a Shortcut that can be installed by adding the Text-to-Speech icon (which looks like a pair of lips) to your Shortcut palette.

ClarisWorks will use the female voice regardless of what voice you have chosen through the Speech Setup Control Panel. There is no way to modify which voice ClarisWorks uses.

It has also been reported that this feature will also work on a Quadra 950 running Speech Manager 1.1 or later.

Free Rotate Not Available for Bitmap Graphics

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
ClarisImpact will not allow you to use the Free Rotate command on bitmap graphics. While the menu option for Rotate can be chosen, ClarisImpact will beep at you when you try to rotate a bitmap graphic that has been Pasted or Placed. Bitmap graphic formats include Paint and TIFF images on the Macintosh.

However, you can use Transform options on your inserted bitmap graphics. Rotate 90 degrees, Flip Horizontal and Flip Vertical all work well, if you do not need to rotate in single degree increments.

If you need to rotate a bitmap graphic in increments less than 90 degrees, rotate the bitmap in another program like ClarisDraw or BrushStrokes, then bring it back into ClarisImpact using Copy and Paste or Insert.

Paragraph and Line Spacing In ClarisWorks and ClarisImpact

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.

ClarisWorks Word Processing documents and ClarisImpact Report documents allow you to specify exact settings for paragraph text. They both allow you to specify the line spacing (distance between lines of text, sometimes called "Leading") and paragraph spacing (distance between paragraphs). You can enter these settings into the Paragraph dialog after you choose the Paragraph... command in the Text Menu of ClarisImpact, or in the Format Menu of ClarisWorks.

In both applications, there is a big difference between "fixed" line spacing and "variable" line spacing. If you choose "Lines" as your spacing measurement, you are using a variable line spacing, and the height of each line varies automatically depending upon the size of the text or in-line graphic which is stored on that line. If you choose any other option (Inches, Points, Centimeters, Millimeters, or Picas), you are using fixed line spacing, and the height of each line will not automatically change, regardless of the size of your data. This means that if you set a fixed line spacing, and use a text size that is too large to be properly displayed, you may see the characters clipped.

Also, because both applications use .5 point (a Point is 1/72 of an Inch) as the basic unit for measuring line and paragraph spacing, it is not possible to set some fixed line spacing intervals. If you enter an invalid spacing measurement into the Paragraph format dialog, you may notice that ClarisImpact will automatically round it to the nearest valid interval after you click OK to confirm the setting.

For example, if you try to set your text to have a line spacing of .2 inch, ClarisImpact will round that to .19 inch, which is the equivalent of 13.5 points. You will only see .19 inch after you click OK and exit the dialog. (Clicking Apply does not force ClarisImpact to change the value to a valid entry, though it does allow you to see the results of the change to your document.) You can always use whole numbers for fixed line spacing, so you can enter 1 centimeter or 1 pica, even though it does not round evenly to a half point.

In addition, if you use "lines" as the measurement when setting the distance between paragraphs (either of the settings for "Space Before" or "Space After"), you are limited to whole line increments. For example, you could not set 1.5 lines before or 2.75 lines after, though you could choose 2 lines before the paragraph and 3 lines after the paragraph. To assign paragraph offset in smaller increments, you must use one of the fixed line spacing measurements. Keep in mind the paragraph above which talks about the accuracy of those fixed measurements.

You can use the following table to find a valid measurement for paragraph or line spacing:
.5 point = 1/144 inch = 0.0069 inch = 0.0017 pica = .1764 mm = 0.01764 cm
1 in = 6 pica = 25.4 mm = 2.54 cm = 72 pt
1 centimeter = 0.3937 in = 0.43 pica = 10 mm = 28.35 pt
1 millimeter = 0.0394 in = 0.04 pica = 0.1 cm = 2.84 point
1 pica = 0.1667 in = 0.0066 mm = 0.066 cm.

Restoring the Default 256-Color Palette

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.

Q:
I switched the palette in Preferences to one of the 256 editable color palettes by using the Load Palette button. How can I use the original 256 editable color palette again? I tried locating this palette with the Load Palette button but it does not appear to be located on my hard disk.

A:
The default 256 editable color palette is built into ClarisWorks and ClarisImpact. In order to switch back to this default palette, follow the instructions below.

1. Open Preferences and switch the color palette from the 256 editable color palette to the Drawing and Text Colors palette and then click the OK button.
2. Open Preferences again and switch the color palette from the Drawing and Text Colors palette* to the 256 editable color palette but do not click the Load Palette button. When you click on the OK button your original 256 color palette will be back.

Additional Considerations:

If you are using a black & white Macintosh or a Macintosh with only 16 display colors, you will not see the option for changing color palettes. Change your display back to 256 colors and make the palette changes.

If you want to make the switching between palettes easier, you can use the Save button in Preferences to save the default palette as a file that can be located with the Load Palette button.

* Called "Claris 81 Color Palette" in ClarisImpact.

Sample Data Appears In Inserted Rows and Columns

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
ClarisImpact automatically fills all inserted rows and columns with sample data, when you insert rows or columns into the table which is attached to a data chart. To generate the sample data, ClarisImpact simply duplicates the Row or Column that was selected just before invoking the Insert Cell command. If you replace the sample data with your data, the Chart will graph properly.

This only happens with the table which is attached to a Data Chart. It does not happen with the Table Model even though it might appear to be similar to a Data Chart.

Possible Incompatibility Between ClarisWorks and Mobius Speedster 025F Accelerator Board (All)

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
A Claris customer has reported that he had a issue with the Mobius Speedster 025F Accelerator Board and was unable to launch ClarisWorks 2.1.

The board ships with a Control Panel allowing manual or automatic choice of modes in which to run the computer (Full 68040 with cache enabled, 68040 without cache, or 68030 mode).

The customer's issue was solved by contacting Mobius for an updated version of the Control Panel.

According to a technician at Mobius, the "Speedster" Control Panel version needed is 1.3.2 or greater. Mobius Accelerator owners may contact Mobius at 800-800-4334 to obtain the updated Control Panel.

How to Make All Flow Chart Model Styles Available

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.

On page 5-4 & 5-10 of the ClarisImpact User's Guide, and in the ClarisArt booklet, there are screen shots showing all of the available Flow Chart Model Styles and Symbol Sets. However, the complete set of available Styles and Symbol Sets is not automatically installed. To make the full Symbol Set available, follow the instructions below:

1. Quit ClarisImpact if it is running.
2. Locate the folder named, "Full FlowChart Style Set". This folder is automatically installed in the "ClarisImpact Color Styles" folder in the "ClarisImpact" folder. If the folder is not present, use your ClarisImpact installation disks to reinstall it.
3. The "Full FlowChart Style Set" folder contains two files with the same names as two files in your "ClarisImpact Color Styles" folder, "FlowChart Styles" and "FlowChart Symbols". Replace the files in the "ClarisImpact Color Styles" folder with the two files in the "Full FlowChart Style Set" folder.
4. Launch ClarisImpact and you will have full Flow Chart Symbol Sets and Model Styles.

WARNING: If you have added custom Symbols or Model Styles then the procedure above will delete them. Move any custom Styles or Symbols into a Library or a saved document for temporary storage so that you can copy them back after following the steps above.

NOTE: The same procedure can be done if you are using ClarisImpact B&W Styles. The black and white version of the "Full FlowChart Style Set" folder and all of the associated files is located in the "ClarisImpact B&W Styles" folder.

Some ClarisImpact 1.0v1 Flow Chart Symbols Do Not Close Properly

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
Some of the Flow Chart Symbols in ClarisImpact 1.0v1 have borders that do not close properly. For instance, the beginning and ending of the border for the "Input/Output" Symbol* do not meet to close the polygon properly. This issue is evident on screen and print.

The Flow Chart Symbols for ClarisImpact 1.0v2 have been redrawn so that all polygon borders close properly.

* The "Input/Output" Symbol shown on page 2-26 of the "Claris Art" manual is not the same as the one referred to above (this version of the "Input/Output" Symbol can be used from a Library). The version that works improperly in ClarisImpact 1.0v1 is included in the Symbols menu choice from the Flow Chart menu.

Directly Opening A Particular File Without Using Open Dialog

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
FileMaker Pro shows the Open File dialog box automatically when the program first starts. If you want to skip past this step and go right into a particular file when you start FileMaker Pro, you can do this by creating an icon for the file in Program Manager.

In Program Manager, choose New from the File menu. The Program Item, which is one of Winodws' names for icons, should already be selected. Click OK. In the Description section, type whatever description you wish. In the Command Line, type the EXACT location of the file (i.e. which directory it is located in) along with the file name EXACTLY as it appears in FileManager. For example, a FileMaker Pro file called "Billings.fm" that is in the FMPRO directory on your C drive will have an icon with these properties:

Description: My billing file
Command line: C:\\FMPRO\\FMPRO.EXE Billings.fm
Working directory: C:\\FMPRO

When you click OK, an icon should be created with the FileMaker Pro symbol. To select a different icon, click on the icon just once and choose Properties from the File menu. If you click on the Change Icon button in the Program Item Properties dialog box you can select a different icon.

Opening Networked Databases Using AppleScript

Alternatives to using System 7 Aliases to open networked files

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.
FileMaker Pro offers many ways of automating the opening of documents, applications, and databases. Here is a way to open a FileMaker Pro database that is being shared over the network using ScriptMaker and a scripting tool such as AppleScript. This method allows you to open a database automatically through Apple Events just as if you had clicked on the network button in the Open dialog.

1) Create a script with ScriptMaker that opens the shared database. As an example we will call this script Open Network Database. To create the script, select the Open step, click on specify, and then click on the network button. Select the file that is being shared over the network. You will see the zone listed next to the file name when viewing the script steps.

Script name: Open Network Database
Open ["Contacts.FM (Marketing Zone)"]

2) Launch the script from a scripting utility using the Do Script event. With AppleScript you would create an applet with the following statements:

```
tell application FileMaker Pro
Do Script FileMaker Script "Open Network Database"
end tell
```

ALTERNATE METHOD- Using AppleScript.

Within AppleScript you can open databases within your current zone using the command:

```
Open file "Contacts.FM" of
zone "Marketing Zone"
```

The use of [of zone "zonename"] is optional. Opening files from another zone using this methodology does not work (for FileMaker Pro 2.1v3 or later).

As a workaround, set your network protocol to MacIPX or TCP/IP. These network protocols do not have zones.

LaserWriter IINTX: New ROMs Avalable May 1990

There is a new version of LaserWriter NTX ROMs being rolled into production in late May. These ROMs contain an updated version of PostScript. PostScript version 51.8 allows for the following enhancements.

This article has been archived and is no longer updated by Apple.

- Full support of software switching between emulations and ports - It is now possible to both switch into and out of an emulation mode via software.

- Improved support of multiple SCSI disks - Up to 8 SCSI hard disk drives can now be connected to the LaserWriter NTX SCSI port. Up to 80% of the hard disk with the lowest SCSI ID is used for font caching with the remainder of that disk and all of any other connected hard disk used for downloaded fonts. Each hard disk is now formatted as a separate volume which allows a user move a disk (other than the startup disk) between systems without needing to re-format.

- Additional characters in the HP LaserJet+ emulation - Four characters have been added that had been left out of the original implementation of HP LaserJet+ emulation.

- Improved default settings for HP LaserJet+ bit map printing - Previously, bitmaps in HP LaserJet+ mode were interpreted at 7-bit thus ignoring a significantbit. The new ROMs default to 8-bit serial communications.

NOTE: These new ROMs are found in any LaserWriter NTX with a part number ending in 6004/A.

Cell Borders Do Not Work With Tables Using "Modern" Style

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
Adding a cell border in a Table Model created with the Modern Style does not appear to work. This is because the Modern Table Style was designed with white cell borders instead of black.

To change your cell border color to black:

1. Select All cells (or as many as you need to change).
2. Choose Grid Display from the Table menu.
3. Change the cell border color from white to black.

Now you should be able to see the cell borders.

About Version 1.5v3, Release Notes

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
This version of MacDraw Pro fixes a problem with placing library objects while running on a Power Macintosh in emulation mode.

MacDraw Pro 1.5v2 Release notes (for those updating from 1.5v1)

A PICT import bug was fixed. Under certain circumstances, open polygons were closed when they were imported.

A PICT export bug was fixed. Under certain circumstances, a rounding error would cause objects to be clipped when opened in other applications.

A text entry bug was fixed. Text was lost when entering text by clicking in the document and changing Font and Size attributes through their associated dialogs.

A Gridline display bug was fixed. When running System 6.0.x with millions of colors, MacDraw Pro 1.5 displayed solid gridlines when the Screen buffer was turned off.

An Open Application (oapp) Apple event bug was fixed. A system crash occurred when sending an oapp event when MacDraw Pro 1.5 was already open and in the background.

The "Command-Option-Space" key sequence used to hide and show the Tool and Style bars, has been extended to include "Command-Option-Tab". This key sequence was added for use with system 7.1. Note that either "Command-Option-Space" or "Command-Option-Tab" will work when running systems 6.0.x or 7.0.x.

Legal Considerations
The enclosed UpdateMaker updater program is ©1992 by AD Instruments, Inc. Suite H, 2251 Grant Rd., Los Altos, CA 92024.

The software code changes contained within the Updater, the original software, and the software created by the updater program is © 1987-1994 Claris Corporation. All rights reserved. Claris and FileMaker are registered trademarks of Claris Corporation. All other trademarks are property of their respective owners.

The following license agreement applies:

PLEASE READ THIS DOCUMENT CAREFULLY PRIOR TO USING THIS SOFTWARE.

The enclosed computer program is an update (the ÒUpdateÓ) to MacDraw Pro 1.5v1, 1.5v2, or 1.5v3 (the "Software"). In order to use and/or copy the Update as authorized by this License, you must have validly licensed at least one copy of the Software. You are required to have a validly licensed copy of the Software for each copy of the Update made hereunder. The Update and the copies authorized herein replace your validly licensed copies of the Software and are not additional copies (i.e., you may not use the Update in addition to the Software the Update is replacing).

The Update is licensed, not sold, to you by Claris Corporation ("Claris") for use only under the terms of this License, and Claris reserves any rights not expressly granted to you. You own the disk(s) on which the Update is recorded or fixed, but Claris and its licensers retain ownership of the Update itself.

1. License. This License allows you to (i) make copies of the Update, only up to the number of validly licensed copies of the Software in your possession and (ii) use each such authorized copy on a single computer at a time. You are required to have a validly licensed copy of the Software for each copy of the Update made hereunder. The Update and the copies authorized herein replace your validly licensed copies of the Software and are not additional copies. To "use" the Update means that the Update is either loaded in the temporary memory (i.e., RAM) of a computer or installed on the permanent memory of a computer (i.e., hard disk, CD ROM, etc.). You may use at one time as many copies of the Update as you have licenses for. You may install the Update on a common storage device shared by multiple computers, provided that if you have more computers having access to the common storage device than the number of licensed copies of the Update, you must have some software mechanism which locks-out any concurrent users in excess of the number of licensed copies of the Update (an additional License is not needed for the one copy of the Update stored on the common storage device accessed by multiple computers). If the Update is installed on the permanent memory of a single desktop computer (i.e., not a storage device shared by multiple computers) and that desktop computer is used by one individual for at least 80% of the time the computer is in use, that same individual may also use a copy of the Update on a portable or home computer.

The Update is protected by copyright law. As an express condition of this License, you must reproduce on each copy the Claris copyright notice and any other proprietary legends that were on the original copy supplied by Claris.

You may permanently transfer all your rights under this License to another party by providing to such party all copies of the Update licensed under this License, and the Software the Update replaces, together with a copy of this License and all written materials accompanying the Update, provided that the other party reads and agrees to accept the terms and conditions of this License.

2. Restrictions. The Update contains trade secrets in its human perceivable form and, to protect them, you may not REVERSE ENGINEER, DECOMPILE, DISASSEMBLE, OR OTHERWISE REDUCE THE UPDATE TO ANY HUMAN PERCEIVABLE FORM. YOU MAY NOT MODIFY, ADAPT, TRANSLATE, RENT, LEASE, LOAN, RESELL FOR PROFIT, OR CREATE DERIVATIVE WORKS BASED UPON THE UPDATE OR ANY PART THEREOF.

3. Termination. This License is effective until terminated. This License will terminate immediately without notice from Claris or judicial resolution if you fail to comply with any provision of this License. Upon such termination you must destroy the Update, all accompanying written materials, and all copies thereof. You may also terminate this License at any time by destroying the Update, all accompanying written materials and all copies thereof.

4. Export Law Assurances. You agree that neither the Update nor any direct product thereof is being or will be shipped, transferred or reexported, directly or indirectly, into any country prohibited by the United States Export Administration Act and the regulations thereunder or will be used for any purpose prohibited by the Act.

5. Limited Warranty and Disclaimer, Limitation of Remedies and Damages. YOU ACKNOWLEDGE THAT THE UPDATE MAY NOT SATISFY ALL YOUR REQUIREMENTS OR BE FREE FROM DEFECTS. CLARIS WARRANTS THE DISKETTES ON WHICH THE UPDATE IS RECORDED TO BE FREE FROM DEFECTS IN MATERIALS AND WORKMANSHIP UNDER NORMAL USE FOR 90 DAYS FROM PURCHASE, BUT THE UPDATE AND ACCOMPANYING WRITTEN MATERIALS ARE LICENSED "AS IS." ALL IMPLIED WARRANTIES AND CONDITIONS (INCLUDING ANY IMPLIED WARRANTY OF MERCHANTABILITY OR FITNESS FOR A PARTICULAR PURPOSE) ARE DISCLAIMED AS TO THE UPDATE AND ACCOMPANYING WRITTEN MATERIALS AND LIMITED TO 90 DAYS AS TO THE DISKETTES. YOUR EXCLUSIVE REMEDY FOR BREACH OF WARRANTY WILL BE THE REPLACEMENT OF THE DISKETTES OR REFUND OF THE PURCHASE PRICE. IN NO EVENT WILL CLARIS OR ITS DEVELOPERS, DIRECTORS, OFFICERS, EMPLOYEES OR AFFILIATES BE LIABLE TO YOU FOR ANY CONSEQUENTIAL, INCIDENTAL OR INDIRECT DAMAGES (INCLUDING DAMAGES FOR LOSS OF BUSINESS PROFITS, BUSINESS INTERRUPTION, LOSS OF BUSINESS INFORMATION, AND THE LIKE), WHETHER FORESEEABLE OR UNFORESEEABLE, ARISING OUT OF THE USE OF OR INABILITY TO USE THE UPDATE OR ACCOMPANYING WRITTEN MATERIALS, REGARDLESS OF THE BASIS OF THE CLAIM AND EVEN IF CLARIS OR AN AUTHORIZED CLARIS REPRESENTATIVE HAS BEEN ADVISED OF THE POSSIBILITY OF SUCH DAMAGES.

Claris' liability to you for actual damages for any cause whatsoever, and regardless of the form of the action, will be limited to the greater of $500 or the money paid for the Update that caused the damages.

THE ABOVE LIMITATIONS WILL NOT APPLY IN CASE OF PERSONAL INJURY ONLY WHERE AND TO THE EXTENT THAT APPLICABLE LAW REQUIRES SUCH LIABILITY. BECAUSE SOME JURISDICTIONS DO NOT ALLOW THE EXCLUSION OR LIMITATION OF IMPLIED WARRANTIES OR LIABILITY FOR CONSEQUENTIAL OR INCIDENTAL DAMAGES, THE ABOVE LIMITATIONS MAY NOT APPLY TO YOU.

6. General. This License will be construed under the laws of the State of California, except for that body of law dealing with conflicts of law. If any provision of this License shall be held by a court of competent jurisdiction to be contrary to law, that provision will be enforced to the maximum extent permissible, and the remaining provisions of this License will remain in full force and effect. If you are a U.S. Government end-user, this License of the Update conveys only "RESTRICTED RIGHTS," and its use, disclosure and duplication are subject to Federal Acquisition Regulations, 52.227-7013 (c) (1) (ii). (See the U.S. Government Restricted provision in the user manual.)

About Version 1.5v3, Updater Read Me

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
MacDraw Pro 1.5v3 Updater
(for U.S. versions only)

Overview
Thank you for investing in Claris(R) software. We hope that you are finding MacDraw Pro to be enjoyable and useful. From time to time, we produce maintenance updates of our software, primarily to correct minor defects that affect a small percentage of our customer base. We'd like to make it as convenient as possible for you to obtain these new versions and enjoy their benefits.

Updates, in contrast to upgrades, contain few changes from the previous version. Instead of distributing the full, revised application, we can provide just the files necessary to incorporate the new functionality and fixes. When you run the accompanying Updater, it will automatically combine your original MacDraw Pro 1.5v1 or MacDraw Pro 1.5v2 application with the new changes to create a new application, MacDraw Pro version 1.5v3.

This document describes the steps you take to apply the update. You may want to print it out if this is the first update you've installed. Once you have run the updater, please read the Release Notes section later in this document.

This update package consists of the "MacDraw Pro 1.5v3 Updater", an application updater for the MacDraw Pro application, and this "Updater Instructions" document.

Technical Considerations
Hard Disk Space
You'll need enough room for a copy of the original application and the new version (approximately 3 megabytes of disk space for both).

Virus Detection Software
The Updater makes several changes to the resources in MacDraw Pro. Many virus utilities consider this activity improper and may try to prevent it, and some of these utilities are not turned off by restarting while holding down the shift key. To avoid this inconvenience, disable all virus detection software before applying the update. To do so, you may have to temporarily remove the utilities from your system folder, then restart. After the program has been updated, put the utilities back in the proper location and restart. See the documentation that came with the utility for information on deinstallation.

Updater Instructions

1. Hold down your shift key and restart your Macintosh. You can lift up on the shift key when you see the message, 'Welcome to Macintosh Extensions Off.' This will help make sure that nothing on your system will conflict with the Updater. If your computer will not start up with the shift key held down, restart without holding down the shift key and go on to the next step.

2. Make a copy of your original MacDraw Pro by single clicking the application icon in the Finder and selecting Duplicate from the file menu.

3. Make a new folder and place the duplicated MacDraw Pro and a copy of the "MacDraw Pro 1.5v3 Updater" into this folder. After moving the application into the new folder you can change its name to "MacDraw Pro" from "MacDraw Pro copy"

4. Double-click the MacDraw Pro 1.5v3 Updater in the new folder. In the UpdateMaker dialog box, make sure the MacDraw Pro application in the new folder is selected in the list and click Update.

5. The update will take a few minutes. When the update is completed, a message is displayed confirming a successful installation of the new version, or an indication of what went wrong if there is a issue.

6. Verify that the update was successful by opening MacDraw Pro and create a new document. Once the application is running select "About MacDraw Pro" from the Apple menu and click the Info button in the dialog. The version number at the top of the list should be "MacDraw Pro 1.5v3* March 1994".

7. Once you have verified that the update was successful throw away the original MacDraw Pro application to avoid any confusion and restart your Macintosh without the shift key down to enable your extensions.

MacDraw Pro 1.5v3 Release notes

This version of MacDraw Pro fixes a issue with placing library objects while running on a Power Macintosh in emulation mode.

MacDraw Pro 1.5v2 Release notes (for those updating from 1.5v1)

A PICT import bug was fixed. Under certain circumstances, open polygons were closed when they were imported.

A PICT export bug was fixed. Under certain circumstances, a rounding error would cause objects to be clipped when opened in other applications.

A text entry bug was fixed. Text was lost when entering text by clicking in the document and changing Font and Size attributes through their associated dialogs.

A Gridline display bug was fixed. When running System 6.0.x with millions of colors, MacDraw Pro 1.5 displayed solid gridlines when the Screen buffer was turned off.

An Open Application (oapp) Apple event bug was fixed. A system crash occurred when sending an oapp event when MacDraw Pro 1.5 was already open and in the background.

The "Command-Option-Space" key sequence used to hide and show the Tool and Style bars, has been extended to include "Command-Option-Tab". This key sequence was added for use with system 7.1. Note that either "Command-Option-Space" or "Command-Option-Tab" will work when running systems 6.0.x or 7.0.x.

Legal Considerations
The enclosed UpdateMaker updater program is (c)1992 by AD Instruments, Inc. Suite H, 2251 Grant Rd., Los Altos, CA 92024.

The software code changes contained within the Updater, the original software, and the software created by the updater program is (c) 1987-1994 Claris Corporation. All rights reserved. Claris and FileMaker are registered trademarks of Claris Corporation. All other trademarks are property of their respective owners.

The following license agreement applies:

PLEASE READ THIS DOCUMENT CAREFULLY PRIOR TO USING THIS SOFTWARE.

The enclosed computer program is an update (the "Update") to MacDraw Pro 1.5v1, 1.5v2, or 1.5v3 (the "Software"). In order to use and/or copy the Update as authorized by this License, you must have validly licensed at least one copy of the Software. You are required to have a validly licensed copy of the Software for each copy of the Update made hereunder. The Update and the copies authorized herein replace your validly licensed copies of the Software and are not additional copies (i.e., you may not use the Update in addition to the Software the Update is replacing).

The Update is licensed, not sold, to you by Claris Corporation ("Claris") for use only under the terms of this License, and Claris reserves any rights not expressly granted to you. You own the disk(s) on which the Update is recorded or fixed, but Claris and its licensers retain ownership of the Update itself.

1. License. This License allows you to (i) make copies of the Update, only up to the number of validly licensed copies of the Software in your possession and (ii) use each such authorized copy on a single computer at a time. You are required to have a validly licensed copy of the Software for each copy of the Update made hereunder. The Update and the copies authorized herein replace your validly licensed copies of the Software and are not additional copies. To "use" the Update means that the Update is either loaded in the temporary memory (i.e., RAM) of a computer or installed on the permanent memory of a computer (i.e., hard disk, CD ROM, etc.). You may use at one time as many copies of the Update as you have licenses for. You may install the Update on a common storage device shared by multiple computers, provided that if you have more computers having access to the common storage device than the number of licensed copies of the Update, you must have some software mechanism which locks-out any concurr
ent users in excess of the number of licensed copies of the Update (an additional License is not needed for the one copy of the Update stored on the common storage device accessed by multiple computers). If the Update is installed on the permanent memory of a single desktop computer (i.e., not a storage device shared by multiple computers) and that desktop computer is used by one individual for at least 80% of the time the computer is in use, that same individual may also use a copy of the Update on a portable or home computer.

The Update is protected by copyright law. As an express condition of this License, you must reproduce on each copy the Claris copyright notice and any other proprietary legends that were on the original copy supplied by Claris.

You may permanently transfer all your rights under this License to another party by providing to such party all copies of the Update licensed under this License, and the Software the Update replaces, together with a copy of this License and all written materials accompanying the Update, provided that the other party reads and agrees to accept the terms and conditions of this License.

2. Restrictions. The Update contains trade secrets in its human perceivable form and, to protect them, you may not REVERSE ENGINEER,

DECOMPILE, DISASSEMBLE, OR OTHERWISE REDUCE THE UPDATE TO ANY HUMAN PERCEIVABLE FORM. YOU MAY NOT MODIFY, ADAPT, TRANSLATE, RENT, LEASE, LOAN, RESELL FOR PROFIT, OR CREATE DERIVATIVE WORKS BASED UPON THE UPDATE OR ANY PART THEREOF.

3. Termination. This License is effective until terminated. This License will terminate immediately without notice from Claris or judicial resolution if you fail to comply with any provision of this License. Upon such termination you must destroy the Update, all accompanying written materials, and all copies thereof. You may also terminate this License at any time by destroying the Update, all accompanying written materials and all copies thereof.

4. Export Law Assurances. You agree that neither the Update nor any direct product thereof is being or will be shipped, transferred or reexported, directly or indirectly, into any country prohibited by the United States Export Administration Act and the regulations thereunder or will be used for any purpose prohibited by the Act.

5. Limited Warranty and Disclaimer, Limitation of Remedies and Damages. YOU ACKNOWLEDGE THAT THE UPDATE MAY NOT SATISFY ALL YOUR REQUIREMENTS OR BE FREE FROM DEFECTS. CLARIS WARRANTS THE DISKETTES ON WHICH THE UPDATE IS RECORDED TO BE FREE FROM DEFECTS IN MATERIALS AND WORKMANSHIP UNDER NORMAL USE FOR 90 DAYS FROM PURCHASE, BUT THE UPDATE AND ACCOMPANYING WRITTEN MATERIALS ARE LICENSED "AS IS." ALL IMPLIED WARRANTIES AND CONDITIONS (INCLUDING ANY IMPLIED WARRANTY OF MERCHANTABILITY OR FITNESS FOR A PARTICULAR PURPOSE) ARE DISCLAIMED AS TO THE UPDATE AND ACCOMPANYING WRITTEN MATERIALS AND LIMITED TO 90 DAYS AS TO THE DISKETTES. YOUR EXCLUSIVE REMEDY FOR BREACH OF WARRANTY WILL BE THE REPLACEMENT OF THE DISKETTES OR REFUND OF THE PURCHASE PRICE. IN NO EVENT WILL CLARIS OR ITS DEVELOPERS, DIRECTORS, OFFICERS, EMPLOYEES OR AFFILIATES BE LIABLE TO YOU FOR ANY CONSEQUENTIAL, INCIDENTAL OR INDIRECT DAMAGES (INCLUDING DAMAGES FOR LOSS OF BUSINESS PROFITS, BUSINESS INTERRUPTION, LOSS OF BUSINESS INFORMATION, AND
THE LIKE), WHETHER FORESEEABLE OR UNFORESEEABLE, ARISING OUT OF THE USE OF OR INABILITY TO USE THE UPDATE OR ACCOMPANYING WRITTEN MATERIALS, REGARDLESS OF THE BASIS OF THE CLAIM AND EVEN IF CLARIS OR AN AUTHORIZED CLARIS REPRESENTATIVE HAS BEEN ADVISED OF THE POSSIBILITY OF SUCH DAMAGES.

Claris' liability to you for actual damages for any cause whatsoever, and regardless of the form of the action, will be limited to the greater of $500 or the money paid for the Update that caused the damages.

THE ABOVE LIMITATIONS WILL NOT APPLY IN CASE OF PERSONAL INJURY ONLY WHERE AND TO THE EXTENT THAT APPLICABLE LAW REQUIRES SUCH LIABILITY. BECAUSE SOME JURISDICTIONS DO NOT ALLOW THE EXCLUSION OR LIMITATION OF IMPLIED WARRANTIES OR LIABILITY FOR CONSEQUENTIAL OR INCIDENTAL DAMAGES, THE ABOVE LIMITATIONS MAY NOT APPLY TO YOU.

6. General. This License will be construed under the laws of the State of California, except for that body of law dealing with conflicts of law. If any provision of this License shall be held by a court of competent jurisdiction to be contrary to law, that provision will be enforced to the maximum extent permissible, and the remaining provisions of this License will remain in full force and effect. If you are a U.S. Government end-user, this License of the Update conveys only "RESTRICTED RIGHTS," and its use, disclosure and duplication are subject to Federal Acquisition Regulations, 52.227-7013 (c) (1) (ii). (See the U.S. Government Restricted provision in the user manual.)

Useful Modem Commands

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
All Hayes-compatible modems have registers that govern the modem's behavior. You can modify these registers and perform a variety of other tasks with Hayes commands.

In ClarisWorks, you can issue Hayes commands by choosing Connection from the Settings menu and selecting the Serial Tool. Then choose Open Connection from the Session menu.

Here is a sampling of some of the useful Hayes commands. Press return after each command to send it to the modem. If you find a command doesn't work for your modem, consult your modem manual. Modems can differ in how they implement commands. Where you see n, substitute a number. Zero generally means off. All 0 characters below are zeros unless otherwise mentioned.

AT - If you are connected to the modem properly, it will answer "OK."
ATDT - Dial a phone number (tone)
ATDP - Dial a phone number (pulse)
ATZ - Reset modem
AT&F - Restores the modem's original factory settings.
AT&V - Produces a screen dump showing the current modem register settings.
ATEn - Local echo. Substitute1 for n to turn it on, 0 to turn it off.

AT&K0 - Disable data compression for communicating with low-speed modems that you are having issues connecting with.
AT&M0 - Disable error correction for communicating with low-speed modems that you are having issues connecting with.
AT&D0 - Force on the Data Terminal Ready (DTR) signal. Can be helpful if you experience sudden hangups during file transmissions. The usual setting is AT&D2.
ATS110=0 - Disable V.32bis. Helpful if you are having issues connecting to a picky V.32 modem which lacks the additional bis protocol.
ATMn - Modem speaker volume
ATS0=n - Sets the number of rings on which to answer in Auto Answer mode.
ATS7=n - Sets the number of seconds the modem waits for a carrier. Default is usually 60. May need to be increased for international calls or numbers that don't answer immediately.
+++ - Escape to command mode. Enables you to switch to Hayes command mode while online.
ATO - Return to online mode. That's the letter O, not a zero! If this fails, try AT01 which returns online and asks both modems to resynchronize.

Five Ways To Speed Up Windows And Windows Programs

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
One of the most frustrating situations is operating a software program that doesn't run as fast as you'd like. Anyone who's ever had to wait five seconds for a line they've typed to appear, or for a field they've dragged with the mouse to move on screen knows how uncomfortable a slow computer feels. Aside from adding more memory (RAM) to your computer, there are many ways to increase the speed of Windows that are both easier and cheaper than adding RAM. Some of these are well known, some more obscure, but if you're struggling with a pokey computer, all of them are worth a try.

1. Remove EMM386.EXE from your Config.SYS
While Windows does require Extended Memory in order to run, it does not use Expanded Memory or EMS. If most of your applications are in Windows, you can speed them up considerably by removing the EMM386 driver that provides Expanded Memory to DOS applications. This is done by removing the following line from your Config.SYS file:

DEVICE=C:\\DOS\\EMM386.EXE NOEMS

You must exit Windows and restart your computer for this change to take effect.

Of course, EMM386 may be running from a directory other than DOS, and you may have other settings after the EMM386.EXE name. However, removing EMM386.EXE presents two problems: first, you won't be able to load any DOS-level drivers high, which may cause Out of Memory errors in Windows if you don't have enough conventional memory. Second, memory management should then be done in the system.ini to accomodate network cards, etc. that load into the UMB area.

If you must run EMM386.EXE to load DOS drivers high, than you want to make sure the NOEMS setting is used. If the word RAM is there instead, a section of memory that could be used by Windows programs is taken away to provide Expanded Memory. If not enough RAM memory is available for a Windows program, Windows will provide disk space as something called Virtual Memory to make up the shortage. This will cause a tremendous slowdown of your Windows program's performance.

2. Use a Standard VGA Display Driver
While many applications require a high resolution display with thousands of colors, most people find that a standardVGA driver provides adequate display and gains speed. If you are using an 800 X 600 or 1024 X 768 driver, you may find that switching to a 640 X 480, 16-color driver will dramatically speed up your work. If you absolutely must run at higher resolutions, switching to a driver that has less colors will certainly speed things up.

To change drivers, open the Windows Setup program (usually located in the Main Window). Select Change System Settings from the Options menu, and pull down the Display list. Select the driver that says just "VGA" from the list and click on the OK button. If you already have the VGA driver on the system, click on the Current button when it appears. You must then restart Windows for the change to take effect.

3. Make Sure Windows is in Enhanced Mode
Basically, Windows 3.1 on a 386 or better machine can run in two modes; Standard and 386 Enhanced. To find out which one you are running in, select Help from the Program Manager menu and choose About Program Manager. If you see that you are in Standard Mode, click OK, exit Windows, and at the DOS prompt type reopen Windows by typing

WIN /3 <Enter>.

This will put you in Windows' 386 Enhanced Mode. If you are running Windows for Workgroups 3.11, you are already in 386 Enhanced Mode because Standard Mode was removed in that version of Windows.

4. The Windows Swap File
Windows running in 386 Enhanced Mode frees up memory by building a temporary swap file on the hard disk. Setting up a permanent swap file can greatly improve speed by preventing the constant fragmentation created by a temporary file.
To create a permanent swap file, select the Control Panel's 386 Enhanced button. Click the Virtual Memory button, then select Change. Choose the hard drive from the Drive list, then select Permanent from the Type list. Depending on the size of your hard drive, you can accept the recommended size or enter a new size. If you see the Use 32-Bit Disk Access box, make sure it's checked. Click OK, then click Restart to restart Windows.

5. Check your Load Line
The Load line in the Win.INI file automatically launches applications in Windows to run as icons. This means you may actually be loading applications that are eating up memory without knowing it.

To check this, open the WIN.INI file in the Notepad. Check the [Windows] section for a line that reads "Load =", and delete anything after the "=" that you do not need to load. Save the file and restart Windows.

Error in Weekly Planner Template from ClarisWorks Home Pack Templates (SS)

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.

If you open the Weekly Planner template that ships with the ClarisWorks Home Pack template set, you may have difficulty using it. Page 2-20 of the instructions for the Home Pack indicate that you should "Enter the date of the Sunday starting the week ...", but if you attempt to type a date into cell C6, you will get an error "Some cells are locked."

All that you have to do is Unprotect the cell (Choose Options menu, Unprotect cells), and you can type in the new value without a issue.

Applesoft: PEEKs, POKEs, and CALLs

To make Applesoft programs read data from memory, write data to memory, or pass control to machine language programs, programmers use Applesoft's PEEK, POKE, and CALL statements.

Here is an explanation of each statement's function.
This article has been archived and is no longer updated by Apple.
PEEK makes a program read a memory location. The format of the statement is PEEK (<memory location>) where <memory location> is a positive integer from 0 to 65535. Programmers use PEEK most commonly with a variable: X% = PEEK (2048) assigns the value located at 2048 to the integer variable X%.

POKE makes a program write a value to a memory location. The format of the statement is POKE <memory location>,<value> where <memory location> is a positive integer from 0 to 65535 and <value> is a positive integer from 0 to 255. Programmers use POKE most commonly to write data directly to memory: POKE 2048,128 assigns the value 128 to the memory location 2048.

CALL makes a program pass control to a machine language routine at some memory location. The format of the statement is CALL <memory location> where <memory location> is a positive or negative integer from -32768 to 32767 or a positive integer from 0 to 65535 (note that the signed integers from -32768 to 32767 represent exactly the same memory locations as the positive integers from 0 to 65535). Programmers use CALL most commonly used to invoke routines built into the Apple II's ROM. For example, the statement CALL -936 invokes the routine which clears the screen and homes the cursor (just like using Applesoft's HOME statement).

To change the screen display or make sounds and other special effects on the Apple II, Apple II Plus, Apple IIe, Apple IIc and Apple IIGS, Applesoft accesses various memory locations. Each particular CPU's reference manual includes a memory map where you can find the segments of memory used by text, graphics, Applesoft, the monitor and peripheral cards.

Apple-published memory locations remain the same for most members of the Apple II family; other internal locations may change. Therefore, to assure that your programs will work properly on all Apple II family computers, do not use entry points other than those printed in the Apple manuals.

Locations used to communicate with interface cards may be found in the manuals for those devices. For example, memory locations used by the Apple 80-column card are found in the 80-Column Text Card Manual and the Extended 80-Column Text Card Supplement.

Many computer and book stores sell books with listings of Applesoft, monitor ROM, DOS 3.3 and ProDOS memory locations. You may find the following publications useful:

--What's Where in the Apple by William Luebbert; Micro Ink.
--Beneath Apple DOS by Don Wirth and Pieter Lechner; Quality Software.
--Beneath Apple ProDOS by Don Wirth and Pieter Lechner; Quality Software.
--The Apple Almanac by Eric Goez and Williams Sanders; Datamost, Inc.

DOS 3.3: Hiding Machine Language Routines above the File Buffers

Is it possible to position your machine language routines between DOS and its first file buffer so that they won't be overwritten by BASIC programs.

This article has been archived and is no longer updated by Apple.

It's possible to position your machine language routines between DOS and its first file buffer so that they won't be overwritten by BASIC programs.

Since $9D00 and $9D01 (48K system) point into the first, highest buffer:

1. Add the number of pages (256 byte blocks) your routine needs to the contents of $9D01.

2. Put a $00 in the address now pointed at by the contents of $9D00, $9D01.

3. Store a $00 at the address pointed at by the contents of $9D00, $9D01 plus $25.

4. Perform a JSR $A7D4 to rebuild the DOS file buffers and move the current BASIC's HIMEM down.

The first available address for your routine is the address pointed at by the contents of $9D00, $9D01 plus $2D.

Document and Creator Codes for Claris Applications

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.

The Macintosh operating system uses type and creator codes to identify which application created the file and to identity what type of document they are. These codes can be used by some file find utilities (such as RetrieveIt! from Claris ClearChoice) to locate files. AppleScript can use these codes to identify file types to display in dialog boxes. The following is a list of Claris Applications and their document type and creator codes.

Application	Document Type	Creator Type
MacWrite Pro	MWPd	MWPR
MacWrite II	MWII	APPL
FileMaker II	FMK4	FMK4
FileMaker Pro 2.x	FMPR	FMPR
FileMaker Pro 2 SDK run	FMPR	FMPU
FileMaker Pro 2 SDK files	FMPR	FMPR
FileMaker Pro 3.x	FMP3	FMP3
FileMaker Pro 3 SDK run	APPL	UFSR
FileMaker Pro 3 SDK files	FMP3	UFSR
ClarisWorks(WP)	CWWP	BOBO
ClarisWorks(DR)	CWDR	BOBO
ClarisWorks(PT)	CWPT	BOBO
ClarisWorks(DB)	CWDB	BOBO
ClarisWorks(SS)	CWSS	BOBO
ClarisWorks(CM)	CWCM	BOBO
ClarisDraw	dDrw	CDrw
ClarisImpact(Drw)	iDrw	CIPT
ClarisImpact(Rpt)	iRpt	CIPT
ClarisImpact(Prs)	iPrs	CIPT
ClarisImpact(Drw Stn.)	iDst	CIPT
ClarisImpact(Rpt Stn.)	iRst	CIPT
ClarisImpact(Prs Stn.)	iPst	CIPT
ClarisImpact(Library)	iLib	CIPT
ClarisImpact(Model)	iSty	CIPT
ClarisImpact(Prefs)	iPrf	CIPT
ClarisImpact(Clr Pal)	iClr	CIPT
ClarisImpact(Help)	HUH?	CIPT
MacDraw Pro	dDoc	dPro
Claris Resolve	RsWs	Rslv
MacProject Pro	MPRX	MPRP

AppleScript can use type and creator codes to identify types of documents when using the choose file command. This can be useful if one only wants files created by a specific application to be shown in a directory dialog box when using the Choose File scripting addition in AppleScript.

```
set myFile to (choose file with prompt "Select a MacWrite Pro Document..." of type
{"MWPd", "MWPR"})
tell application "MacWrite Pro1.5"
   activate
   open myFile
end tell
```

This script tells the Choose file scripting addition to bring up a directory dialog and to only show MacWrite Pro documents. Once a document has been selected, the document's path is placed in the variable "myFile". That variable is then passed to MacWrite Pro and the file is opened.

Tray Selection And The HP 4 Printer Driver

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.

The Hewlett-Packard printer driver HPPCL5E, which supports the Laserjet 4, 4M, 4SI, and 4SI MX printers, doesnÕt save paper tray selections between Windows sessions. If you change the paper source in the printers control panel, the setting is set in Windows programs, however, once you exit and re-enter Windows the HP 4 printer driver will revert to the default Auto Select option for the paper tray. You can work around this problem by editing your WIN.INI file. Use a text editor such as Windows' Notepad to open the WIN.INI text file and then locate a section called:

[HPÊLaserJet 4/4M] or [HP LaserJet 4SI/4SI MX]

You must then manually change the tray selection to one of the selections shown below:

1 MPÊTray 5 Envelope Feeder
2 Paper Cassette 7 Auto Select
4 Manual Feed 11 Lower Cassette

For example, the HP 4 section in the WIN.INI that has these lines:

[HP LaserJet 4/4M, LPT1]
paper=1
prtcaps=-5240
prtcps2=4561
tray=1

This example sets the paper tray selection to be the MP Tray every time Windows starts. The HP 4 printer driver default for the tray= line is

tray=7

which is Auto Select.

ClarisWorks Manual: Irregular Wrap Figure

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
Page 3-40 of the ClarisWorks 2.x manual shows irregular text wrap around the sample picture file "Pegasus Logo." Because the Pegasus logo is bitmapped, ClarisWorks cannot wrap irregularly as shown in the manual.

See article "Irregular Text Wrap Around Bitmapped Graphics" for a workaround.

EPSF Files Exported From T/Maker‘s ClickArt Collection Do Not Print to LaserWriter

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.

T/Maker has produced a series of ClickArt libraries that are bundled with a utility program called ClickArt Image Exporter. In order to create a file from these libraries that can be imported or placed into another document, you must use the ClickArt Image Exporter to convert the ClickArt file into an EPSF, PICT or AI (Adobe Illustrator '88) file. Any EPSF file created with the ClickArt Image Exporter and placed in a MacDraw Pro document will not print to a LaserWriter. When attempting to print this document to a LaserWriter with background printing active, Print Monitor will inform you that a Postscript error has occurred. The error is, 'undefinedresult', and the offending command is, 'itransform'. When printing without background printing active, the activity window will display the alert, 'A Postscript error has occurred: The error is, 'undefinedresult''. Canceling the printing at this point will prompt another alert from MacDraw Pro, "Sorry, the printer was unable to print some objects."

Workaround
Place the EPSF file into a new MacDraw Pro document. Save this document as an EPSF file. Import this new EPSF file into your original document. This will print.

T/Maker is aware of the issue.

Alignment on Postscript Printers

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
Most Postscript printers have their printable regions factory aligned to a tolerance of 1/8 inch. This means that if you print a page from an application, with a line exactly 1 inch from the physical edge of the page, it may be off by as much as 1/8 inch in one direction or the other. This applies to both vertical and horizontal alignment.

This is not a problem with the Windows Postscript driver. The Windows Postscript driver does not set the position of the printable region; it uses the factory set position. If the factory set position is off, the Windows Postscript output will be off.

You can permanently adjust the position of the printable region on the page in increments of 1/300 inch.

Use the following Postscript code to adjust the position on the page of the printable region:

```
serverdict begin 0 exitserver
statusdict begin
yyy xxx setmargins
start
^D
^C
```

The "yyy" above represents the number of 1/300-inch units that you want to adjust the vertical position of the printable region. Positive numbers move the printable region downward, and negative numbers move the region upward.

The "xxx" represents the number of 1/300-inch units that you want to adjust the horizontal position. Positive moves the region to the right, and negative moves to the left.

To adjust the position, follow these steps:

1. Create a test page in your application:

a. Place a vertical line exactly 1 inch from the left edge of the page.

b. Place and a horizontal line exactly 1 inch from the top edge of the page.

c. Set both vertical and horizontal margins to 0.

2. Print the page, and measure the amount by which the lines vary from their ideal 1-inch positions.

3. Convert this measurement to 1/300-inch units. For example, 1/16 inch would be approximately 19 units.

4. Use an ASCII text editor (such as Notepad) to create a text file of the above Postscript code. Note that you create the ^D and ^C lines by using the caret character on the keyboard, not by typing CTRL+D or CTRL+C. Substitute your measurements for the the "yyy" and "xxx".

5. Copy the file to your printer. Most Postscript printers reprint their

startup pages at this point. If you receive a Postscript error printout, your printer does not support this type of operation.

Your printable region alignment is now corrected. Reprint your test page to verify this. If you overcorrected, simply repeat this process using new measurements.

The new alignment is written to your printer's nonvolatile memory and the adjustment is permanent.

Capture File Problems (CM)

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.

Sometimes, after using the Capture to File command during a ClarisWorks communications session, when you open the capture file after the session, you may see some strange characters in it. Another problem which can occur is that only some of the data you saw on screen was saved to the file.

Strange Characters

ClarisWorks can capture data from the port or the screen. You change this setting in Preferences. When you capture from the the port, all of the data the host sends is captured, including special characters. If you find this makes the session data unusable, try capturing from screen instead.

Missing Data

Some hosts clear the screen before filling in the next screen. When you are capturing from the screen, this results in much of the session data not being saved. To resolve this problem, click the "save screen before clearing" checkbox in Preferences.

There are some cases where this will not solve the problem, and they are usually caused by hosts that only update the portions of the screen that need changing. For example, in an online name and address database, after seeing the first record, only the data in the fields will be updated as you browse and the form won't be resent. Without the form, no capture can take place. Capturing from the port is the best solution in these cases.

Windows 3.x: Using a Generic Postscript Driver

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.
This article has been archived and is no longer updated by Apple.
Under Microsoft Windows version 3.0, you can install the generic Postscript Printer driver to use your printer's Postscript capabilities. Under Windows version 3.1, you should install a printer driver that has the same name as the specific model name of your printer. If you're unsure which model that is, or are having problems with your driver, install the Apple LaserWriter IINT.

The generic Postscript Printer driver still exists for those applications that require this generic driver name to run properly with Postscript functionality. However, you should only use the generic driver as a last resort. It doesn't perform all operations as well as using the specific model for your printer. Consider the Apple LaserWriter IINT the Generic Postscript driver in Windows 3.1 and above.

With version 3.5 of the generic Postscript driver (shipped with Windows 3.1), any settings required for the print job need to be specified from Control Panel, not from within the application you are printing from.

Resetting the Index of a ClarisWorks Database that Does Not Sort Correctly (DB)

Issues with sorting and finding in a ClarisWorks database can be frustrating and difficult to troubleshoot. But like any database, ClarisWorks stores information in an index which can be reset.

This information was provided by Claris Corporation on 16 March 1998, and incorporated into Apple Computer's Tech Info Library.

This article has been archived and is no longer updated by Apple.
If you determine that your ClarisWorks database is not sorting correctly, particularly if it's a sort that has worked correctly in the past, try the following steps:

1. Save a copy of the current file in case something goes wrong with the remaining steps.
2. Choose Define Fields... from the Layout menu .
3. Highlight the field that is not sorting correctly and change to a different type. (i.e. if field was of the type Date, select Text then click Modify)
4. Change field type back to original type.
5. Perform Sort.
